

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator amittitur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia fercula probant, ne quid contristant convivatorem.
Erasmus.

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distrust a kind host.
Translation.

NOXIOUS, *adj.* } *Lat. noxius.* Hurt-
NOXIOUSNESS, *n. s.* } ful; baneful; mischiev-
NOXIOUSLY, *adv.* } ous; unwholesome :
hence criminal; guilty; unfavorable: the sub-
stantive and adverb correspond.

The writers of politics have warned us of the
noxiousness of this doctrine to all civil governments,
which the Christian religion is very far from disturb-
ing. *Hammond.*

Those who are noxious in the eyes of the law are
justly punished by them to whom the execution of
the law is committed. *Bramhall against Hobbes.*

Preparation and correction is not only by addi-
tion of other bodies, but separation of noxious parts
from their own. *Brown.*

Kill noxious creatures, where 'tis sin to save :
This only just prerogative we have. *Dryden.*
Noxious seeds of the disease are contained in a
smaller quantity in the blood. *Blackmore.*

See pale Orion sheds unwholesome dew,
Arise, the pines a noxious shade diffuse ;
Sharp Boreas blows, and nature feels decay,
Time conquers all, and we must all obey. *Pope.*
Too frequent an appearance in places of much re-
sort is noxious to spiritual promotions. *Swift.*

NOY (William), attorney-general under Charles
I, was the son of William Noy of St. Burian,
gent. In 1593 he was sent to Exeter College,
thence to Lincoln's Inn, where he became eminent
in juridical knowledge. He was twice elected
M. P. for Helston, and in both parliaments ze-
alously opposed king James's attempts to increase
the royal prerogative. In 1625 he was elected
M. P. for St. Ives, and in that and the following
parliament continued to shine as a popular patriot ;
but in 1631 the court converted him by appointing
him attorney-general ; after which he pleaded for
the extension of the royal prerogative as zealously
as he had formerly opposed it. He wrote several
treatises ; particularly, 1. *The Complete Lawyer* ;
2. *Arguments of Law, and Speeches* ; 3. *The*
Principal Grounds and Maxims of the Laws of
England, 4to. He died at Tunbridge Wells, in
August 1634.

NOYON, an ancient and pretty post town,
and chief place of a canton in the arrondissement
of Compiègne, department of the Oise, France,
containing 3750 inhabitants. Situated at the foot
and on the side of a hill, this town is surrounded
with a number of richly cultivated gardens, pre-
senting an appearance of the greatest abundance
and riches. It is very well built and very airy,
adorned with public fountains and crossed by
the Vorse, which here separates into two branches,
and falls into the Oise at the distance of about a
mile from the town. Noyon was, for some time,
the capital of the emperor Charlemagne, who was
crowned here. Hugh Capet was elected king
here in 987. Three times it was devastated by

VOL. XVI.—PART. I.

fire, in 1131, 1152, and 1228. There are manu-
factories here of linen, muslins and caps, and
large tan-yards ; and a trade is carried on in these
articles, and in corn, leather, &c. This is the
native place of the celebrated Calvin. It is
eighteen miles north-east of Compiègne, and
thirty-one S. S. W. of St. Quentin.

NOZLE, *n. s.* From Nose, which see. The
nose ; the snout ; the end.

It is nothing but a paultry old sconce, with the
noze broke off. *Arbuthnot and Pope's Mart. Scrib.*

NUBIA, a country of Africa, situated between
the cataract of the Nile, at Syene or Assouan, Aby-
sinia, and the Red Sea. It sometimes is considered
as including Sennaar, but this seems of sufficient
importance as a separate state to be treated dis-
tinctly, see **SENNAR** : the whole is a part of the
ancient Ethiopia. Nubia consists almost entirely
of rocks and sandy deserts. Along the banks of
the Nile it is indeed occasionally fertile, and di-
vided into a great number of petty principalities
or states, governed by absolute chiefs, called me-
leks or cachefs. But the whole population of
this territory, which is about 500 miles long, but
very narrow, is estimated by Mr. Burckhardt at
only 100,000 individuals. It is divided into
two parts, called Wady Kenous, and Wady el
Nouba, sometimes also called Sayd : the inhabi-
tants of these two divisions speaking different
languages, although their manners and customs
appear similar. The city of Dongola, to which
the Mamelukes retired on their being driven
by the pacha of Egypt from that country, is the
largest place along this line. Its neighbourhood is
particularly famous for the breed of horses, one
of which is said to be valued on the spot at ten
or twelve slaves. But Dehr is regarded as the
capital of Nubia.

The geography of the whole valley of the Nile
south of Philæ is very defective. Its geology
and mineral products, the probable elevation of
the stream of the Nile, and its natural history,
even as to the plants and animals, &c., have
been wholly neglected until the journey of Burck-
hardt, who himself did not penetrate farther into
this region than about 26° N. lat., and who
has by no means exhausted these topics. We
shall give, however, the particulars that have
been furnished, and add a few extracts from the
observations of recent travellers.

Beyond Egypt the eastern bank of the Nile is
said to be better watered and adapted to culti-
vation than the western ; although almost all the
ruins of this region are on the opposite bank.
It is thought, therefore, that this last must have
been formerly more fertile, but has been reduced
to its present state by the continual encroach-

B

ment of the immense moving sands of the west. The territory is irrigated here not by the overflowing of the Nile, but by *sakies*, or wheels, constructed for the purpose of raising the waters of the river; the government receiving for the use of each wheel so many fat sheep, and measures of grain, called *dhourra*. This forms the great object of Nubian culture; it is the botanical *holcus arundinaceus*. The people grind it by strewing the grain upon a large stone, and rubbing a smaller one over it. If the bread is to be of superior quality, the *dhourra* is well washed and then dried in the sun. This pains, however, they do not often take. It is placed in an earthen jar, and left to ferment from twenty-four to thirty-six hours, when it acquires a sourish taste; and the substance being merely poured upon an iron plate, or flat stone, placed over the fire, in a few minutes it is baked into cakes resembling the Abyssinian *liff*. They are brought to table hot, in a wooden bowl, with onion sauce, broth, and milk, or butter. Cakes of a thinner kind, and well toasted, are prepared for the caravans, and will keep for some months. They have also, after the *dhourra*, a crop of barley here, French beans, lentils, or water-melons. Tobacco is cultivated every where, and is a chief luxury, either smoked or sucked rather than chewed. Animal food is scarce. The liquors (in which they indulge) are palm wine, a spirit distilled from dates, and, above all, *bouza*, a fermented liquor made from the *dhourra*. No fruit is cultivated except palms for dates.

The climate of Nubia, though intensely hot in summer, is very dry and salubrious. The plague, which is so common near the lower parts of the Nile, never reaching beyond the second cataract. So healthy was this country during Mr. Burckhardt's visit, that in a journey of five weeks he did not observe a single person laboring under disease. The small-pox, however, makes occasionally great havoc here. In general the inhabitants are of full stature, well made, and have fine features. The women possess sweet countenances and pleasing manners. They are also said to be modest and reserved: but, if the wealthiest Nubian happen to have a daughter whom the chief demands in marriage, the father cannot venture to refuse him: and the chiefs have thus wives in every considerable village. The Nubian is extremely jealous of his wife's honor, and on the slightest suspicion of her infidelity, we are told, would carry her in the night to the side of the river, lay open her breast by a cut with his knife, and throw her into the water, as he says, 'to be food for the crocodiles.' Their houses are chiefly of mud or loose stones; the last being usually planted two together, one for the male, and the other for the female members of the family. The mud huts are roofed with *dhourra* stalks or palm leaves. The utensils of the family generally consist of about half a dozen coarse earthen jars, a few earthen plates, two stones for grinding the *dhourra*, and a hatchet. The domestic employment of the females consists in weaving coarse woollen and cotton cloth for shirts and mantles, and mats of date leaves; they also make the small drinking bowls and plates used for the *dhourra* bread. A woollen

cloth and linen cap form the dress of the rich. The women wrap themselves in black woollen gowns; but boys and girls go about naked. In ascending the Nile, the dress of all classes becomes more and more scanty.

Although fire-arms are comparatively rare, the Nubian is seldom unarmed; the first purchase a boy makes is a short crooked knife, tied over the elbow, and ready to be drawn on the slightest quarrel. The Kenou and Noubia tribes are almost always engaged in bloody quarrels; and, when death ensues, the family of the deceased may demand the price of blood, or retaliate on the brother, son, or near relative, so that a whole family is often thus obliged to fly. Great numbers of the lower orders repair to Cairo to act as porters.

The natives of Dar el Mahass, the most southerly district, differ considerably from the other Nubian tribes. They are perfectly black, and their lips like those of the negro, but not the nose or cheek. The king of Mahass is described by Burckhardt as a mean-looking man, attended by half a dozen naked slaves, armed with shields and lances. This is the nearest part of the black country whence slave traders arrive at Cairo. Their houses are constructed of mats made of palm leaves, fastened to high poles, the extremities of which go through the roof.

Nubia is principally visited for its splendid remains of antiquity, rivalling the most colossal monuments of Thebes or Hindostan. The most magnificent is that of Ipsambul, still in a state of almost complete preservation, and sculptured out of the living rock. It has at least ten colossal figures attached; six in front, and four that Mr. Burckhardt found buried in the sand, at about the distance of 200 yards. One of them, from the dimensions of the shoulder, could not, if uncovered, be less than sixty-five or seventy feet in height. They were conjectured to have been constructed to serve as ornaments to an immense temple: some of their countenances were beautifully expressive.

Another extensive part of Nubia extends from the Nile to the Red Sea; and here modern travellers have only penetrated in the line taken by the caravan to Sennaar. It is said to contain not a single permanent abode, but is a complete desert, interspersed with wadys or valleys, affording some few trees and shrubs, with a few wells or rills. Burckhardt, after passing through the deserts of Suez and Sinai, did not think, however, this quite so dreary. Unlike the other African deserts, it is covered with hills.

At the southern extremity of this tract is Berber, consisting of four large villages, employed in a brisk trade between Egypt, Arabia, and Central Africa. The people are said to be a handsome race, of a dark red-brown color. The men are taller than the Egyptians, and much stronger; the nose is often perfectly Grecian here, and the cheek bones not prominent. 'We are Arabs, not negroes,' they say; and they are careful to maintain the purity of their race. Few men have more than one wife; but every one who can afford it keeps a slave or mistress, called his companion. Few traders pass through Berber without taking one of them, were it only for a

week or two; and a general dissoluteness of manners is the natural effect. Every thing discreditable to humanity is said to be found in the character of this race; but treachery and avidity predominate. Quarrels are frequent and violent, especially at their drinking parties; and they commonly end in bloodshed. The chief scenes of these disorders are the bouza huts, kept by women of infamous character, by whom the liquor is manufactured: no one ventures there without taking his sword with him; and various persons of distinction who have entered have never been known to return. A common trick is to entice strangers to one of these women, who next day is owned as a relation, and vengeance or presents demanded for the dishonor done to the family.

Another part of the miscellaneous territory is the road to Souakin, through the populous and fertile district of Taka.

The chief trade of Berber, and of Nubia generally, consists in slaves imported from the interior of Africa, and conveyed northwards into Egypt, or across the Red Sea by Souakin and Jidda. The annual number is estimated at 5000, of whom about 2500 are for Arabia, 1500 for Egypt, and 1000 for Dongola and the Bedouins of the mountains. Few of these unhappy beings are above the age of fifteen; they are chiefly used in the east as domestics. The most valued are between eleven and fifteen; if males they sell for fifteen or sixteen dollars; if females, for twenty-five or twenty-six. While they remain within the negro territories they are treated with great indulgence; but when once in the desert, where they have no chance of escape, the treatment is entirely changed.

Mr. T. Legh, M. P., is the earliest of the modern band of travellers whose contributions to the illustration of this region are before us. He penetrated further along the banks of the Nile into the ancient Ethiopia than any preceding traveller. At Siala it was deemed expedient to wait on the Douab cacheff, who was encamped about a mile and a half from the river, forming a sort of advanced guard of the Nubians: they found the men in wigwags; the women and children apart in tents; the whole body about 400; the horses and camels feeding around them. The cacheff received them kindly; made no sort of objection to their proceeding up the river, and told them he would send an express to Dehr, to inform Hassan cacheff of their intended visit to his capital. He offered them milk, flour and butter, invited them to eat out of the same bowl with him, the strongest mark of hospitality and friendship, and, in return for some coffee and tobacco, presented them with a sheep.

At Dondour was a small temple containing nothing more remarkable than the character A + U upon the fragments showing it to have been the possession of some early Christians. The weather began now to be exceedingly sultry; the thermometer in the cabin was at 86°; in the outer air 96°, and in the sand 126°; but it was a great relief to find the inhabitants every where peaceably disposed; they brought the travellers dates, milk, and whatever their scanty means enabled them to afford. The temple of Sibhoi was minutely

examined, and no doubt remained of its having been a celebrated sanctuary of pure Egyptian architecture. Mr. Legh thinks it probably of an earlier date than those in Egypt; the walls being built in a ruder style, and the hieroglyphics, though bold, of inferior execution; but the statues, he adds, and the sphinxes would bear a closer examination. He was greatly struck with the high state of preservation of the stone and outward walls of these venerable ruins, as compared with the state of those below the cataracts. 'No reasonable allowance of difference of date,' he says, 'will explain this; and we must seek for the cause in the mild unalterable climate between the tropics. The corroding hand of time has no effect upon them, but they are abandoned to the desert, and many of them will in a few years entirely disappear.'

About fourteen miles further brought them to Dehr, the capital of Nubia, to wait on Hassan cacheff, the chief of the Barabras. At this moment the people were celebrating the festival of the cacheff's marriage, which our travellers were rather surprised to hear them call (in lingua Franca) a fantasia. They rode through scattered plantations of date trees, among which were interspersed a number of mud huts, till they reached the house of the chief, distinguished only by being built of brick, and consisting of two stories. The natives, many of whom were drunk, were greatly astonished at the sudden appearance of the strangers; but offered them no incivility. They brought them paste, with boiled goat's flesh swimming in butter. After waiting about four hours, the cacheff made his appearance, attended by five or six officers, and a number of Negro guards; he was a young man, about six feet high, of a handsome person, half drunk with araki, a spirit distilled from dates. He asked them boisterously what they wanted, and why they came to Dehr? This was but a discouraging reception from a man who had 300 armed negroes at his elbow, and at least 3000 in the district, ready to execute any of his commands. On retiring, he ordered his secretary, who spoke Arabic, to conduct them to a lodging for the night; this was a mud hut of two apartments, but without a roof; it was, however, next to that of the cacheff, the best in all Dehr. Early in the morning the secretary called upon them, and hinted that his master expected a present, and that one of their swords would be acceptable. On waiting on the Cacheff, they offered him a watch, of which he declined the acceptance, as they were unable to comprehend its use. Perceiving that any facilities for the further progress of their journey depended on the sacrifice of one of their swords, Mr. Legh presented him with a fine Damascus blade worth at least 500 piastres: the effect was instantaneous: his eyes sparkled with pleasure, and his lips uttered nothing but friendship. He enquired after our author's harem—if he had left it at the cataract, 'meaning,' says Mr. Legh, 'as I understood, to give me a female slave to wait upon my wife.' He afterwards made him a present of a negro boy, and granted permission for them to proceed to Ibrim, offering horses and dromedaries, or any thing else that could be of service.

It required half a day's journey from Dehr to reach Ibrim, and, as there was nothing to interest them there, they returned to Dehr the same evening. The following is all that we are told of Ibrim. 'Not a vestige of life was seen about us; the destruction of Ibrim by the Mamelukes, when they passed two years ago into Dongola, had been so complete that no solitary native was to be found wandering among its ruins; there was not even a date tree to be observed. The walls of the houses, which are in some places still standing, alone attest that it has once been inhabited. The population was partly carried off by the Mamelukes, and has partly removed to Dehr.'—p. 76.

At Dehr the only monument of antiquity is a temple or grotto, excavated in the solid rock; but at Amada, about an hour's journey from thence, on their return, they saw a fine temple which had been converted by the early Christians into a church; the painted figures that had been stuccoed over were in wonderful preservation. Below Sibhoi they fell in with their old acquaintance shekh Ibrahim (Mr. Burckhardt), whom they had left at Siout in good health and condition, and well dressed like a Turkish gentleman; he had now the appearance of a common Arab, looking very thin and miserable. He had been living, he said, for some time with the shekhs of the villages on lentils, bread, salt, and water, and was most happy to share a mutton chop with our travellers, though cut from a lean and half starved sheep, for which, however, they had paid the extravagant price of a dollar. Ibrahim then departed on his route to the southward.

At Dakki there is a fine and perfect temple, with the hieroglyphics in high relief. The height of the propylon is about fifty feet; its front ninety feet, and its depth at the base eighteen feet. The space between that and the temple forty-eight feet; the temple itself eighty-four feet in length, thirty in breadth, and twenty-four in height. Many Greek inscriptions are cut on the propylon, recording the devotion of those who visited these sacred buildings. Of these our travellers copied two. The first is—'I, Apollonius, the son of Apollonius, commander-in-chief of the province of Ombi, and of the district about Elephantina and Philæ, came and worshipped.'—The second—'I, Callimachus, the son of Hermon, came with him and worshipped the same God, in the thirty-second year of the emperor— ΙΦΟΥΦ —the meaning of which they pretend not to determine.

At Guerfeh Hassan, nine miles below Dakki, they found also an excavated temple 'that far surpassed any thing they had witnessed above or below Essouan, and was indeed a stupendous monument of the labor bestowed by the ancients on their places of devotion.' It consists of an area or outer court sixty-four feet in length, and thirty-six in breadth, having six columns on each side, to which are attached statues of priests. The passage into the temple, through a door six feet wide, is formed by three immense columns on each side, to which are attached colossal statues of priests (on pedestals three feet three inches high), each eighteen feet six inches in

height; and whose splendid dresses had once been covered with paint and gold. There are three chambers of considerable size, and four smaller apartments. 'We found,' the travellers say, 'no inscription on this temple, which is a most astonishing monument of labor and ancient magnificence. The various apartments we explored, together with the statues that ornament them, are all hewn out of the living rock.' A similar magnificent though ruined structure was found at Kalaptshi.

The plain of Umbarakat is strewn with ruins. At Sardab and Debodé are also many interesting ruins which are briefly described. On the second arrival of our travellers at Philæ they observed that 'it is impossible to behold the profusion of magnificent ruins with which this island abounds without feelings of admiration and astonishment.' at the same time it is avowed that the excavated temple of Guerfeh Hassan, and the ruins of Dakki and Kalaptshi, appeared to rival some of the finest specimens of Egyptian architecture.

'During the whole of this interesting journey,' says Mr. Legh, 'we had found the natives universally civil, conducting us to the remains of antiquity without the least suspicion, and supplying us with whatever their scanty means would afford. It is true they viewed us with curiosity, and seemed astonished at our venturing among them; and at Kalaptshi they asked our guide, 'How dare these people come here? Do they not know that we have 500 muskets in our village, and that Douab cacheff has not the courage to come and levy contributions?'—p. 97.

Captain Light of the artillery followed a similar track with Mr. Legh to exactly the same point in Nubia, Ibrim; whence he returned down the hill, and examined the temple of Leboo, called Legh Sibhoi; and describes its avenues of sphinxes, its gigantic figures in alto-relievo, its pilasters, and hieroglyphics. He discovered at Ouffedonnee the remains of a primitive Christian church, in the interior of which were many painted Greek inscriptions and figures of scriptural subjects. The ruins of a temple at Deboo are also minutely described. Captain Light thus sums up his observations on the natives of Nubia:—'The people who occupy the shores of the Nile between Philæ and Ibrim are, for the most part, a distinct race from those of the north. The extent of the country is about 150 miles, which, according to my course on the Nile up and down, I conceive may be about 200 by water, and is estimated at much more by Mr. Hamilton and others. They are called by the Egyptians Goobli, meaning in Arabic the people of the south. My boatmen from Boolac applied Goobli generally to them all, but called those living about the cataracts Berber. Their color is black; but the change to it, in the progress from Cairo, does not occur all at once to the traveller, but by gradual alteration to the dusky hue from white. Their countenance approaches to that of a negro; thick lips, flattish nose and head, the body short, and bones slender: the leg bones have the curve observed in negroes: the hair is curled and black, but not woolly. Men of lighter complexion are found amongst

them; which may be accounted for by intermarriage with Arabs, or a descent from those followers of Selim the Second who were left here upon his conquest of the country. On the other hand, at Galabshee, the people seemed to have more of the negro than elsewhere; thicker lips, and hair more tufted, as well as a more savage disposition.

'The Nubian language is different from the Arabic. The latter, as acquired from books and a teacher, had been of very little use to me in Egypt itself; but here not even the vulgar dialect of the Lower Nile would serve for common intercourse, except in that district extending from Dukkey to Deir, where the Nubian is lost, and Arabic prevails again: a curious circumstance; and, when considered with an observation of the lighter color of this people, leads to a belief of their being descended from Arabs. The Nubian, in speaking, gave me an idea of what I have heard of the clucking of Hottentots. It seems a succession of monosyllables, accompanied with a rise and fall of voice that is not disagreeable. I saw few traces among them of government, or law, or religion. They know no master, although the *cachef* claims a nominal command of the country: it extends no farther than sending his soldiers to collect their tax, or rent, called *Mirri*. The pasha of Egypt was named as sovereign in all transactions from Cairo to Assuan. Here, and beyond, as far as I went, the reigning sultan Mahmood was considered the sovereign; though the *cachef's* was evidently the power they feared the most. They look for redress of injuries to their own means of revenge, which, in cases of blood, extends from one generation to another, till blood is repaid by blood. On this account they are obliged to be ever on the watch and armed; and, in this manner, even their daily labors are carried on,—the very boys go armed. They profess to be the followers of Mahomet, though I rarely happened to observe any of their ritual observances of that religion. Once, upon my endeavouring to make some of them comprehend the benefit of obedience to the rules of justice for punishing offences, instead of pursuing the offender to death as they practised, they quoted the Koran to justify their requiring blood for blood. Their dress, for the men, is a linen smock, commonly brown, with red or dark-colored skull cap. A few wear turbans and slippers. The women have a brown robe thrown gracefully over their head and body, discovering the right arm and breast, and part of one thigh and leg. They are of good size and shape, but very ugly in the face. Their necks, arms, and ankles, are ornamented with beads or bone rings, and one nostril with a ring of bone or metal. Their hair is anointed with oil of cassia, of which every village has a small plantation. It is matted or plaited, as now seen in the heads of sphinxes and female figures of their ancient statues. I found one at Elephantina which might have been supposed their model. Their little children are naked. Girls wear round the waist an apron of strings of raw hide, and boys a girdle of linen. Their arms are knives or daggers, fastened to the back of the elbow or in the girdle, javelins, tomahawks, swords of Roman shape,

but longer, and slung behind them. Some have round shields of buffalo hide, and a few pistols and muskets are to be seen.'—pp. 93-97.

In January 1813 Mr. Burckhardt left Cairo on his first journey through Nubia, and returned to Assuan on the 30th of March, thirty-five days after setting out from this place, during which he only allowed himself a single half-day's rest at Derr. No opportunity offering of proceeding into Western Africa, he projected a second journey to the banks of the Atbara, or Astaboras, and from thence to Djidda or Moka, and to return by land along the eastern shore of the Red Sea to Cairo. The detailed account of this expedition, as far as Djidda on the Arabian coast of the Red Sea, forms the subject of the greater part of a volume of his travels now before us. In this journey he crossed that desert to the westward of Dongola by which Bruce returned from Abyssinia, and which has been described in such frightful terms by this enterprising traveller; but the dangers and the sufferings of Burckhardt were occasioned neither by the privations of the desert, nor its poisonous winds, nor its moving pillars of sand; but by his apparent poverty, which exposed him to every kind of insult from the wretches with whom he travelled. In fact he economised the means supplied to him by the African Association, until he had nearly defeated the objects for which he was employed. On the 24th February he left Assuan, on the first of these journeys in Nubia, with two dromedaries, and an Arab guide, a native of Nubia, for whose services he bargained as far as Derr, a journey of 140 miles, and for which one Spanish dollar was considered as ample payment. The Nubians of Assuan were, at the time of his departure, at war with their southern neighbours, on account of the latter having intercepted a vessel laden with dates belonging to a merchant of the former. In the scuffle a woman in a state of pregnancy had been killed by a stone. The southern party, to whom the deceased belonged, were now demanding from their enemies 'the debt of blood,' not only for the woman, but for the child also which she bore in her womb; and this dispute had not been adjusted on our traveller's return. Immediately beyond Assuan the mountains approach so near to the Nile as to leave scarcely the width of 100 yards of cultivable ground. Our traveller passed the first night with the shikh of Wady Debot (it may here be observed, once for all, that though the term *wady* generally means a river, it is used, along the borders of the Nile as far as Sennaar, for a valley, or ravine in the mountains). 'Here,' says Mr. Burckhardt, 'I first tasted the country dish—which, during a journey of five weeks, became my constant food—thin, unleavened, and slightly baked cakes of *dhourra* (*holcus arundinaceus*), served up with sweet or sour milk.'

The whole of the road to Derr, on the east bank of the river, is perfectly safe, provided the traveller be accompanied by a native. The people were every where curious and inquisitive. From Assuan to Dehynt the granite chain of mountains had been uninterrupted; from the latter place to the second cataract at

Wady Halfa, the mountain next the river was sandstone, with the exception of some granite rocks above Tafa, extending as far as Kalabshé. At Gyrshe, two days' journey from Assouan, the plain between the river and the mountains is about a mile in width; it is a poor village, and two-thirds of the cottages were abandoned in consequence of the oppressions of the Mamelukes. At Korosko the shore widens, and a grove of date trees enlivens the banks of the Nile the whole way from hence to Ibrim. Groups of houses occur at every 100 yards; and as far as Derr the fields are as carefully cultivated as in any part of Egypt. At Derr Mr. Burckhardt alighted, as all travellers do, at the house of Hassan cachef, who enquired the object of his journey. Encouraged by the success of Messrs. Legh and Smelt, he replied that he had merely come on a tour of pleasure through Nubia, like the two gentlemen who had been at Derr before him; but his Turkish dress and manners, and his perfect knowledge of Arabic, created a suspicion in the bystanders that he was practising deception. His present to the cachef, though handsome under ordinary circumstances, appeared when contrasted with that which he had just received from Mr. Legh, to the value of about 1000 piastres, very insignificant and 'un-English.' 'Besides,' said Hassan, 'this gentleman proceeded only as far as Ibrim; whereas you give me a few trifles, and wish to go even to the second cataract!' But Burckhardt hinted that if he sent him back to Esné, and the Beg was there informed of the little attention paid to his letter of recommendation, he might be induced to levy a contribution on the merchandise of the cachef's caravan then about proceeding to Egypt: and our traveller obtained leave to proceed to Sukkot.

As far as Derr he found the eastern bank of the Nile covered with the rich deposit of the river; whereas on the western side the sands of the desert impetuously swept the very brink of the river driven by the north-west winds which prevail during the winter and spring: it is in those places only, where the sandy torrent is arrested by the mountains, that the narrow plain admits of cultivation: the eastern shore is in consequence much more populous than the western. Not far from Derr our traveller noticed a temple of the most remote antiquity. It was hewn entirely out of the sand-stone rock with its pronaos, sekos or cella, and adyton; 'the gods of Egypt,' he observes, 'seem to have been worshipped here long before they were lodged in the gigantic temples of Karnac and Gorne, which are, to all appearance, the most ancient temples in Egypt.'

The Bedouin who accompanied our traveller was of that branch of the Ababde who pasture their cattle on the banks of the river and its islands from Derr to Dongola: they are very poor; mats of the leaves of palm-trees form their tents: they do not permit their women to intermarry with the Nubians; and they have through ages preserved the purity of their race. 'They pride themselves, and justly,' says our traveller, 'in the beauty of their girls.' They are an honest and hospitable people, and of a more kindly

disposition than any of the other tribes of Nubia. The inhabitants of a small island near the village Ketta are thus described:—'These people, who all speak Arabic as well as the Noubia language, are quite black, but have nothing of the negro features. The men generally go naked, except a rag twisted round their middle; the women have a coarse shirt thrown about them. Both sexes suffer the hair of the head to grow; they cut it above the neck, and twist it all over in thin ringlets, in a way similar to that of the Arab of Souakin, whose portrait is given by Mr. Salt in lord Valentia's Travels. Their hair is very thick, but not woolly; the men never comb it, but the women sometimes do; the latter wear on the back part of the head ringlets, or a small ornament made of mother of pearl and Venetian glass beads. Both men and women grease their head and neck with butter whenever they can afford it; this custom answers two purposes; it refreshes the skin heated by the sun, and keeps off vermin.'—p. 31.

The castle of Ibrim and the inhabitants of its territory have an age who is independent of the governors of Nubia, with whom they are often at war. They are of white complexion as compared with the Nubians, and still retain the features of their ancestors, the Bosnian soldiers who were sent to garrison Ibrim by Sultan Selym. 'In no part of the eastern world,' says Mr. Burckhardt, 'have I ever found property in such perfect security as in Ibrim. The inhabitants leave the dhourra in heaps on the field without a watch during the night; their cattle feed on the banks of the river without any one to tend them; and the best parts of their household furniture are left all night under the palm-trees around the dwelling.'—But he adds 'that the Nubians in general are free from the vice of pilfering; and, what is more important, that 'travellers in Nubia have little to fear from the ill will of the peasants: it is the rapacious spirit of the governors that is to be dreaded.'

Near Wady Halfa is the second cataract of the Nile, whose noise was heard in the night at a considerable distance. This part of the river is described as very romantic: the banks, overgrown with large tamarisks, have a picturesque appearance amidst the black and green rocks, which, forming pools and lakes, expand the width of the river to more than two miles. Between this place and Sukkot the navigation is interrupted for about 100 miles by rapids, similar to that at Assouan: in some places, however, the river is tolerably free from rocks and islands; in these its bed is narrow, and its banks are high; near Mershed, Mr. Burckhardt says, 'I could throw a stone over to the opposite side.' At Wady Seras our traveller put up for the night at a hut of Kerrarish Arabs, who were watching the produce of a few cotton fields, and bean plantations. They had not tasted bread for the last two months. Burckhardt made them a present of some dhourra, on condition of their letting the women (who are seldom permitted to enjoy this luxury) partake of it with them; the latter immediately set to work to grind it between two granite stones; 'and the girls sat up eating and singing the whole night.' The mountain

crossed by our traveller to the southward of Seras was of granite and quartz. The Arabs, who act as guides in these desolate mountains, have devised a singular mode of extorting presents from the traveller. They first beg a present; if refused, they collect a heap of sand, and, placing a stone at each extremity of it, they apprise the traveller that his tomb is made. Before he got out of this mountainous district Mr. Burckhardt had a practical proof of this custom: having refused to give any thing to one of these grave-diggers, the man set about making his sand-heap; upon this our traveller alighted and began another, observing, that 'as they were brethren, it was but just that they should be buried together.' The fellow laughed; and they mutually agreed to destroy each other's labors: on Burckhardt's remounting his horse, the disappointed Arab gravely observed from the koran, 'No mortal knows the spot upon earth where his grave shall be digged.' At Wady Okame the dominions of the governor of Sukkot begin, and the country opens out on each side of the river. Having a letter of recommendation from Hassan cachef to the governor of Sukkot, who resides at Kolbe, an island in the Nile, Mr. Burckhardt crossed over in a kind of ferry-boat called a ramous. It consists of the trunks of date trees loosely tied together, and worked by a paddle about four feet in length, forked at the upper extremity, and lashed to the raft by ropes of straw. Its close resemblance to those represented on the walls of the Egyptian temples shows that man, here at least, has not been an improving animal.

The district of Say begins at Aamara, on the plain of which are the ruins of a fine Egyptian temple. The shafts of six large columns of calcareous stone remain, being the only specimen to be met with of that material, those of Egypt being all of sandstone. Mr. Hamilton has observed, that 'the ancient Egyptians do not appear to have employed granite in any of their buildings in Upper Egypt, except in the obelisks and some few of their propylæa.' The castle of Say is built of alternate layers of stone and brick, on an island of the Nile, and, like Ibrim and Assouan, has its own aga, independent of the governors of Nubia; like these, too, its territories are inhabited by the descendants of Bosnian soldiers. Beyond Say, thick groves of date trees and numerous habitations crowded both banks of the river. 'The dates of Sukkot and Say are preferred to those of Ibrim, and are considered superior to all that grow on the banks of the Nile, from Sennaar down to Alexandria; they are of the largest kind, generally three inches in length.'

Burckhardt, on the 13th of March, reached the territory of Mahass, and passed several villages the houses of which were constructed of mats of palm-leaves. The castle of Tinareh had been seized by a rebel cousin of the king of Mahass, but having been besieged for several weeks by the two brothers Hosseyn and Mohammed cachefs, it had capitulated the evening preceding his arrival. He visited the camp of the latter, the son on the mother's side of a Darfur slave, but without any of that mildness which generally

characterises the negro countenance.—'He rolled his eyes at me,' says our traveller, 'like a madman, and, having drunk copiously of palm-wine at the castle, he was so intoxicated that he could hardly keep on his legs.' Goat skins of palm-wine were brought in, and in the course of half an hour the whole camp was as drunk as their chief. Muskets succeeded; and a feu-de-joie was fired with ball in the hut where all were sitting. 'I must confess,' says Burckhardt, 'that at this moment I repented of having come to the camp.' At length, however, the whole party dropped asleep, and a few hours brought the cachef to his senses, so that he could talk rationally. Burckhardt's situation, however, was not much improved. He was suspected of being an agent of the pasha of Egypt;—'But,' said the cachef's Arabic secretary, 'at Mahass we spit at Mohammed Aly's beard, and cut off the heads of those who are enemies to the Mamelukes.'

'I was now,' says our traveller, 'without a friend or protector, in a country only two days and a half distant from the northern limits of Dongola, the newly conquered kingdom of the Mamelukes, against whose interests I was suspected to be acting, while the governors of Mahass supported them.' Under these circumstances he prudently determined to return; but the cachef abruptly ordered him to stay till next day. Burckhardt however expressed his anxiety to reach Derr as speedily as possible, and was dismissed with the usual mixture of insult and contempt.

At the village of Kolbe our traveller obtained a ramous for the baggage, and he and his guide swam the river at the tails of their camels, each beast having an inflated goat skin tied to its neck. He now availed himself of the opportunity of examining, in his way down, the hitherto undiscovered temple of Ipsambul. The six colossal figures in front he found to represent juvenile persons; they are placed in narrow recesses, three on each side of the entrance; their height from the ground to the knee is about six feet and a half. The spaces of the smooth rock between the niches are covered with hieroglyphics, as are also the walls of the apartments. This temple Mr. Burckhardt thinks to have been the model of that at Derr, but much anterior to it in point of time. On the side of the mountain facing the north, against which there was a vast accumulation of sand, and at a distance of about 200 yards from the temple, the upper parts were discovered of four immense colossal statues cut out of the living rock, all the other parts being buried beneath the sands, which are drifted here in torrents from the desert. The head of one of these statues was yet above the surface; and, says our author, 'it has a most expressive youthful countenance, approaching nearer to the Grecian model of beauty than that of any ancient Egyptian figure I have seen; indeed, were it not for a thin oblong beard, it might well pass for a head of Pallas.'—'This statue,' he adds, 'measures seven yards across the shoulders, and cannot therefore, if in an upright posture, be less than sixty-five or seventy feet in height! the ear is one yard and four

inches in length.' Mr. Burckhardt conjectured, that if the sand could be cleared away, an immense temple would be discovered, to the entrance of which the four colossal figures served as ornaments, in the same manner as the six belonging to the neighbouring temple of Isis; and he concluded, from a hawk-headed figure surmounted by a globe, in the centre of the four statues, that this buried temple had been dedicated to Osiris. It was this conjecture that induced Belzoni to undertake the bold enterprise of uncovering it as far down as the doorway, which he effected, with the able assistance and personal exertions of captains Mangles and Irby, of the royal navy. Mr. Burckhardt does not hesitate to pronounce the works of Ipsambul to belong to the finest period of Egyptian sculpture.

The account given by Belzoni and his associates of these extraordinary temples, sculptured out of a whole mountain, induced Mr. Bankes to make a visit here in company with Mr. Salt, to explore these sacred recesses more minutely. For the fatigue and expense of this enterprise, and the exertions of a month in removing the sand, and excavating the rubbish, &c., they were amply rewarded by many new and brilliant discoveries; among the first of which must be reckoned that of a Greek inscription on the leg of one of the colossal statues which guards the entrance, recording the visit of Psammetichus (spelt **ΨΑΜΜΑΤΙΧΟΣ** in the dative, and written in very ancient letters), which, from appearances, it was judged must have been engraved when the temple was already encumbered with sand.

'This is probably,' says the Quarterly Review, 'the most ancient inscription that exists in any intelligible language, as Psammetichus died more than 600 years before Christ—more than 100 years before the conquest of Egypt by Cambyses the Persian—and nearly 200 years before the visit of Herodotus to that country. It is invaluable as an additional corroboration of the truth and accuracy of the Father of Profane History, from whom we learn that this Psammetichus was one of the twelve princes who ruled Egypt; that by the assistance of some Ionians and Carians—'men of brass'—he subdued his eleven associates, and became sole sovereign of the country; that in return for this service they had lands assigned to them, and that they taught the Greek language to the Egyptian youth. 'This inscription is valuable,' adds the above writer, 'in another point of view, as it may assist, with the corresponding hieroglyphics, to decypher those mysterious characters; and it is peculiarly valuable as an undoubted specimen of the advanced state of the arts among the ancient Egyptians; for the temple of Ipsambul is said to contain the finest examples of sculpture, of painting, and of design, now existing either in Nubia or in Egypt. By a new and ingenious contrivance for giving light within the temple, Mr. Bankes made out the complete historical design on the wall of one of the chambers, in which, besides the usual delineations of fortresses, war-chariots, &c., he observed three horsemen mounted without saddles, but with regular bridles.'

Belzoni's subsequent operations may be here briefly detailed. After eighteen days' hard labor he and his boat's crew arrived at the door-way of that temple, which Mr. Belzoni considers as 'the finest and most extensive excavation in Nubia, and one that can stand a competition with any in Egypt, except the tomb newly discovered in Beban-el-Molook.' As the temple of Ipsambul has, in all probability, been covered with sand 2000 years, or more, our readers will not be displeased with the description of it.

'From what we could perceive, at the first view, it was evidently a very large place; but our astonishment increased when we found it to be one of the most magnificent of temples, enriched with beautiful intaglios, painting, colossal figures, &c. We entered at first into a large pronaos, fifty-seven feet long and fifty-two wide, supported by two rows of square pillars, in a line from the front door to the door of the sekos. Each pillar has a figure, not unlike those at Medinet Aboo, finely executed, and very little injured by time. The tops of their turbans reach the ceiling, which is about thirty feet high; the pillars are five feet and a half square. Both these and the walls are covered with beautiful hieroglyphics, the style of which is somewhat superior, or at least bolder, than that of any others in Egypt, not only in workmanship, but also in the subjects. They exhibit battles, storming of castles, triumphs over the Ethiopians, sacrifices, &c. In some places is to be seen the same hero as at Medinet Aboo, but in a different posture. Some of the columns are much injured by the close and heated atmosphere, the temperature of which was so hot that the thermometer must have risen to above 130°. The second hall is about twenty-two feet high, thirty-seven wide, and twenty-five and a half long. It contains four pillars about four feet square: and the walls of this also are covered with fine hieroglyphics in pretty good preservation. Beyond this is a shorter chamber, thirty-seven feet wide, in which is the entrance into the sanctuary. At each end of this chamber is a door, leading into smaller chambers in the same direction with the sanctuary, each eight feet by seven. The sanctuary is twenty-three feet and a half long, and twelve feet wide. It contains a pedestal in the centre and at the end four colossal sitting figures, the heads of which are in good preservation, not having been injured by violence. On the right side of this great hall, entering into the temple, are two doors, at a short distance from each other, which lead into two long separate rooms, the first thirty-eight feet ten inches in length, and eleven feet five inches wide; the other forty-eight feet seven inches, by thirteen feet three. At the end of the first are several unfinished hieroglyphics, of which some, though merely sketched, give fine ideas of their manner of drawing. At the lateral corners of the entrance into the second chamber from the great hall is a door, each of which leads into a small chamber twenty-two feet six inches long, and ten feet wide. Each of these rooms has two doors leading into two other chambers, forty-three feet in length, and ten feet eleven inches wide. There are two benches in them, apparently to sit on.

The most remarkable subjects in this temple are, 1st, a group of captive Ethiopians, in the western corner of the great hall: 2dly, the hero killing a man with his spear, another lying slain under his feet, on the same western wall: 3dly, the storming of a castle, in the western corner from the front door.—pp. 211—213.

Such is the interior. The description of the exterior follows:—

‘The outside of this temple is magnificent. It is 117-feet wide, and eighty-six feet high; the height from the top of the cornice to the top of the door being sixty-six feet six inches, and the height of the door twenty feet. There are four enormous sitting colossi, the largest in Egypt or Nubia, except the great sphinx at the pyramids to which they approach in the proportion of near two-thirds. From the shoulder to the elbow they measure fifteen feet six inches; the ears three feet six inches; the face seven feet; the beard five feet six inches; across the shoulders twenty-five feet four inches; their height is about fifty-one feet, not including the caps, which are about fourteen feet. There are only two of these colossi in sight, one is still buried under the sand, and the other, which is near the door, is half fallen down, and buried also. On the top of the door is a colossal figure of Osiris twenty feet high, with two colossal hieroglyphic figures, one on each side, looking towards it. On the top of the temple is a cornice with hieroglyphics a torus and a frieze under it. The cornice is six feet wide, the frieze is four feet. Above the cornice is a row of sitting monkeys eight feet high, and six across the shoulders. They are twenty-one in number. This temple was nearly two-thirds buried under the sand, of which we removed thirty-one feet before we came to the upper part of the door. It must have had a very fine landing-place, which is now totally buried under the sand. It is the last and largest temple excavated in the solid rock in Nubia or Egypt, except the new tomb.—p. 213, 214. Mr. Belzoni observes that the heat on first entering this temple was so great that they could scarcely bear it, and the perspiration from their hands was so copious as to render the paper by its dripping unfit for use. On the first opening that was made by the removal of the sand, the only living object that presented itself was a toad of prodigious size. The inanimate objects within were the figures of two lions with hawks’ heads, as large as life, and a small sitting human figure.

Opposite to Derr Burckhardt fell in on his return with Hassan cachef, who told him that he had no business in Mahass, and seemed surprised that his brothers had suffered him to proceed thither. Here he witnessed one of those wanton acts of despotism which are but too common in the east. ‘In walking over a large field, with about thirty attendants and slaves, Hassan told the owner that he had done wrong in sowing the field with barley, as water-melons would have grown better. He then took some melon seed out of his pocket, and giving it to the man, said, ‘you had better tear up the barley and sow this.’ As the barley was nearly ripe, the man of course excused himself from complying with the cachef’s command: ‘Then I

will sow them for you,’ said the latter; and ordered his people immediately to tear up the crop, and lay out the field for the reception of the melon seed. The boat was then loaded with the barley, and a family thus reduced to misery, in order that the governor might feed his horses and camels for three days on the barley stalks.’ None of the numerous temples nor of their inscriptions escaped Mr. Burckhardt’s notice, on his return by the western bank of the Nile. Those of Dakke, Gyrshe, Dondour, Kalabshe, Tafa, Kardassy, Debot, are all particularly described, and the comparative excellence of each characterised: but our space forbids extracting his able delineation.

On the evening of the 30th of March, after a hazardous journey of thirty-five days, in which he had rested only one day, Mr. Burckhardt returned to Assouan, having travelled generally at the rate of ten hours a day. What follows is a remarkable feature of this enterprize: ‘I put,’ says he, ‘eight Spanish dollars into my purse, in conformity with the principle I have constantly acted upon, namely, that the less the traveller spends while on his march, and the less money he carries with him, the less likely are his travelling projects to miscarry; and I returned,’ he adds, ‘after a journey of 900 miles, with three dollars, having spent about five dollars, including every expense, except the present to Hassan cachef.’

As no caravan for Eastern Africa set out in the year after his return, Mr. Burckhardt remained quiet at Esnè; he kept no company, dressed himself in the poorest garb of an inhabitant of Egypt; and, in order to conceal his real character more effectually, spent as little money as possible, the amount of his daily expenses, of his servant, dromedary, and ass, being about eighteen-pence, and that of his horse sixteen-pence a month. Yet with all these precautions he was not free from the suspicion of possessing some hidden treasure. Here, however, he remained, till the end of February, when a caravan being on the point of starting from Daraou (three days’ journey to the northward of Esnè), for the confines of Sennaar, he determined to accompany it, and to try his fortune in this new route unattended by any servant.

Our limits will not permit us to trace the route pursued by the caravan. It was on the eastern side of the Nile, but at a great distance from it, being the chord of that great bend of the river to the westward in which Dongola is situated, and the extremities of which are not far removed from Assouan on the north and Berber on the south: it is, in fact, the precise route which was taken by Bruce on his return from Abyssinia. It lies over a perfect desert, except where those numerous wadys, or valleys, in the ridge of mountains on the left, open upon the plain, and in which alone trees, shrubs, and grass, are to be found for the cattle of the caravans, and wells or rills of fresh water. The scarcity of this article is sometimes severely felt; but when calamitous accidents occur, as they occasionally do, Mr. Burckhardt seems to think they happen either from taking circuitous routes, or neglecting to fill an adequate number of

water-skins. The extraordinary sufferings of Mr. Bruce in this desert he conceives to be greatly exaggerated in the relation; at the same time he adds, 'I cannot but sincerely admire the wonderful knowledge of men, firmness of character, and promptitude of mind, which furnished Bruce with the means of making his way through these savage and inhospitable nations, as a European. To travel as a native has its inconveniences and difficulties; but I take those which Bruce encountered to be of a nature much more intricate and serious, and such as a mind at once courageous, patient, and fertile in expedients, could alone have surmounted.'

The wady of Berber consists of four villages situated on the Sandy Desert, about half an hour's walk from the Nile. Each is composed of several quarters, independent of one another; the houses are also separated by court-yards, so that there are no regular streets. They are built of mud, or sun-baked bricks. The rooms all open into the court-yard; two of them are usually occupied by the family, a third serves as a store room, a fourth for the reception of strangers, and a fifth for less laudable purposes. An oblong frame of wood with four legs, with a seat of thin stripes of ox-leather drawn across, is the principal article of furniture; this is called *angareyy*, and answers the double purpose of a sofa by day and a bed by night. Mats of reeds or carpets of leather, without any pillow, are their only bedding. He gives a dreadful picture of the immoral habits of all classes here.

Part of the caravan, and with it Mr. Burckhardt, left Berber on the 7th of April, and proceeded towards Shendy. They soon reached Ras al Wady, the principal village in the dominions of another mek of the name of Hanoze. This sublime personage detained them from morning till late in the evening, without sending them any food, and they could not venture to taste their own, as they were now considered as his guests. The mek himself kept out of sight, but his son came to the caravan to beg some presents. The great man made his appearance, however, the following day, quite naked, with the exception of a towel round his loins, and attended by six or eight slaves, one of whom carried his water-flask, another his sword, and a third his shield. Seeing a fine ass, he ordered his hopeful son to mount it; and, notwithstanding the resistance of its owner, the animal was trotted off to the mek's stable: the caravan was then permitted to depart. At the end of four hours' travelling they reached the river Mogren (not Mareb, as Bruce calls it), the bed of which was nearly dry; but the banks, being covered with fresh herbage and tamarisk bushes, afforded a delightful prospect after the passage of a long and dreary desert. They soon reached the district of Damer, the character of whose inhabitants is just the reverse of that of the Berbers. The town of Damer contains about 500 houses, all neat and uniformly built in regular streets, and inhabited by a tribe of Arabs, the greater part of whom are Fokera, or religious men. They have a pontiff called El Faky el Kebir (the great Faky), who is their chief and judge. Damer has acquired reputation for its schools, to which young men are sent from Dar-

four, Sennaar, Kordofan, and other parts of Soudan, to study the law.

The caravan remained here five days, and, setting out on the 15th of April, reached Shendy on the 18th. Next to Sennaar and Cobbé in Darfour, Shendy is the largest town in eastern Soudan; it consists of several quarters, divided from each other by public market-places, and contains from 800 to 1000 houses, similar to those of Berber. Those of the chief and his relatives have court-yards twenty feet square, enclosed by high walls. The name of the mek is Nimr, or the Tiger. He holds his mekship in right of his mother, who was of the Sennaar tribe, which explains Bruce's account of his having found a woman (Settina, our lady) on the throne. Three different tribes of Arabs inhabit the country of Shendy, besides that to which the mek's wife belongs, and their dissensions among themselves assist materially in the preservation of his authority. As merchandise pays no duty at Shendy, it has become a place of flourishing trade. It is a very large market for slaves.

As a visit to Mecca at the time of the pilgrimage, in order to obtain the title of Hadji (the most powerful recommendation and best protection in any future journey into the interior of Africa), had been the principal motive of our traveller's second journey into Nubia, he set about his preparations for the journey. With this view he sold his little stock of merchandise at Shendy, purchased a slave-boy for sixteen dollars, a camel for eleven, and, after laying in a stock of dhourra meal, butter, and dammour, found he had just four dollars remaining; which he calculated would suffice to carry him to Djidda, on which place he had a letter of credit from Cairo. Thus prepared he joined the caravan for Suakin, by the route of Taka; and here we must leave him for the present. See TAKA.

Twice the serab or mirage appeared to them in crossing this desert, but somewhat different from what had been observed in Egypt. Its color was of the purest azure, and so clear that the shadows of the mountains which bordered the horizon were reflected on it with the greatest precision, and the delusion of its being a sheet of water was thus rendered still more perfect. I had often seen the mirage in Syria and Egypt, but always found it of a whitish color, rather resembling a morning mist, seldom lying steady on the plain, but in continual vibration, but here it was very different, and had the most perfect resemblance to water. The great dryness of the air and earth in this desert may be the cause of the difference. The appearance of water approached also much nearer than in Syria and Egypt, being often not more than 200 paces from us, whereas I had never seen it before at a distance of less than half a mile. There were at one time about a dozen of these false lakes round us, each separated from the other, and for the most part in the low grounds.

To avoid a notorious robber, their Arab guide, in taking them an unfrequented path, lost his way. What follows is highly interesting:—

After five days march in the mountains, their stock of water was exhausted, nor did they know where they were. They resolved, therefore, to

direct their course towards the setting sun, hoping thus to reach the Nile. After two days thirst, fifteen slaves and one of the merchants died. Another of them, an Ababde, who had ten camels with him, thinking that the camels might know better than their masters where water was to be found, desired his comrades to tie him fast upon the saddle of his strongest camel, that he might not fall down from weakness; and thus he parted from them, permitting his camels to take their own way: but neither the man nor his camels were ever heard of afterwards. On the eighth day after leaving Owareyk, the survivors came in sight of the mountains of Shigre, which they immediately recognised, but their strength was quite exhausted, and neither men nor beasts were able to move any farther. Lying down under a rock, they sent two of their servants with the two strongest remaining camels, in search of water. Before these two men could reach the mountain, one of them dropped off his camel, deprived of speech, and able only to wave his hands to his comrade as a signal that he desired to be left to his fate. The survivor then continued his route, but such was the effect of thirst upon him, that his eyes grew dim and he lost the road, though he had often travelled over it before, and had been perfectly acquainted with it. Having wandered about for a long time, he alighted under the shade of a tree, and tied the camel to one of its branches; the beast, however, smelt the water (as the Arabs express it), and, wearied as it was, broke its halter, and set off galloping furiously in the direction of the spring, which, as it afterwards appeared, was at half an hour's distance. The man, well understanding the camel's action, endeavoured to follow its footsteps, but could only move a few yards; he fell exhausted on the ground, and was about to breathe his last, when Providence led that way from a neighbouring encampment a Bisharye Bedouin, who, by throwing water upon the man's face restored him to his senses. They then went hastily together to the water, filled the skins, and, returning to the caravan, had the good fortune to find the sufferers still alive. The Bisharye received a slave for his trouble. My informer, a native of Yembo, in Arabia, was the man whose camel discovered the spring, and he added the remarkable circumstance that the youngest slaves bore the thirst better than the rest, and that, while the grown up boys all died, the children reached Egypt in safety. On the 23rd of March the caravan arrived at Berber, having taken twenty-two days in crossing the desert from Daraou to that place.

NUBILE, *adj.* French, *nubile*; Latin, *nubilis*. Marriageable; fit for marriage.

The cowslip smiles, in brighter yellow drest,
Than that which veils the *nubile* virgin's breast.

Pope.

NUCLEUS, *n. s.* Lat. *nucleus*. A kernel; any thing about which matter is gathered or concentrated.

The crusts are each in all parts nearly of the same thickness, their figure suited to the *nucleus*, and the outer surface of the stone exactly of the same form with that of the *nucleus*.

Woodward.

NUCTA, a dew, which, falling in Egypt about

St. John's day, is by the superstitious natives considered as miraculous, and the peculiar gift of that saint. It is occasioned by the rains which at this period fall in Ethiopia. The Nile at this season is almost stagnant, and in many of its cisterns putrid; but, when it is augmented by these showers, the sun resumes its suspended power of disengaging this light vapor, which never fails to put an immediate stop to the plague, that is but too frequently raging.

NUDDEA (Navadwipa, the New Island), is a large district in the province of Bengal, situated between 22° and 24° of N. lat. It is bounded on the north by Raujishy; on the south by Hooghly and the Sunderbunds; to the east by Jessore; and on the west it is separated from Burdwan by the Hooghly River. In ancient records this district is called Oukerah; but more recently Kishenagur, from the zemindar who held it. In the beginning of the eighteenth century it was bestowed on Ragooram, a Brahmin, ancestor of the present family. This district is fertile in all the more valuable productions of India. It enjoys, besides, the easy and quick navigation of the Hooghly, the Jellinghy, and the Issamutty; yet the revenue is said to bear no comparative proportion to that of the adjacent district of Burdwan. In 1784, by major Rennell's mensuration, this district contained 3115 square miles; the chief towns are Kishenagur, Nuddeah, and Santipoor. Inhabitants about 764,000, in the proportion of two Mahometans to seven Hindoos.

NUDDEA, a town in the province of Bengal, capital of the district of Nuddeah, is situated at the Jellinghy and Cossimbazar rivers with the Hooghly, sixty miles north from Calcutta. It was the capital of a Hindoo principality anterior to the Mogul conquest of Hindostan. A.D. 1204 it was destroyed by Mahommed Bukhtyar Khiljee, the first Mahometan invader of Bengal. In modern times it has been the seat of a Brahmin seminary.

NU'DITY, *n. s.* French, *nudité*; Lat. *nudus*. Naked parts; nakedness.

There are no such licenses permitted in poetry, any more than in painting, to design and colour obscene *nudities*. *Dryden.*

The world's all face; the man who shews his heart

Is hooted for his *nudities* and scorned. *Young.*

NUGATION, *n. s.* } Lat. *nugor*. The act
NUGATORY, *adj.* } or practice of trifling: idle; futile.

The opinion, that putrefaction is caused either by cold, or peregrine and preternatural heat, is but *nugation*. *Bacon.*

Some great men of the last age, before the mechanical philosophy was revived, were too much addicted to this *nugatory* art, when occult quality, and sympathy and antipathy were admitted for satisfactory explications of things. *Bentley.*

NUGENT (Thomas), F.S.A. and LL.D., an ingenious miscellaneous writer and compiler, was born in Ireland, and died in London April 27th, 1772. In 1765 he obtained his diploma from the university of Aberdeen. Among his publications are, *Travels through Germany*, 1768, 2 vols. 8vo.; *Observations on Italy and its Inhabitants*, 1769, 2 vols. 8vo.; and a popular French and English

dictionary. He translated Henault's Chronological Abridgment of the History of France; the Life of Benvenuto Cellini; and various other works.

NUGENT (Christopher), M.D., F.R.S., was a native of Ireland, and father-in-law of Mr. Burke. He published An Essay on Hydrophobia, and practised with reputation as a physician in the metropolis. He died November 12th, 1775.

NUISANCE, *n. s.* Fr. *nuisance*. See NOIANCE. Something noxious or offensive.

Nuisances, as necessary to be swept away, as dirt out of the streets. *Kettlewell.*

This is the liar's lot: he is accounted a pest and a nuisance; a person marked out for infamy and scorn. *South.*

A wise man who does not assist with his counsels, a rich man with his charity, and a poor man with his labour, are perfect nuisances in a commonwealth. *Swift's Miscellanies.*

The encroaching nuisance asks a faithful hand, Patient, affectionate, of high command, To check the procreation of a breed Sure to exhaust the plant on which they feed. *Cowper.*

NUISANCE, in law. Nuisances are either public or private. A public nuisance is an offence against the public in general, either by doing what tends to the annoyance of all the king's subjects, or by neglecting to do what the common good requires: in which case all annoyances and injuries to streets, highways, bridges, and large rivers, as also disorderly alehouses, bawdy-houses, gaming-houses, stages for rope-dancers, &c., are held to be common nuisances. A private nuisance is when only one person or family is annoyed by the doing of any thing; as where a person stops up the light of another's house, or builds in such a manner that the rain falls from his house upon his neighbour's.

NULL, *v. a., adj., & n. s.* } Lat. *nullus*. To
NUL'LIFY, *v. a.* } make void; annul;
NUL'LITY, *n. s.* } annihilate: void,
ineffectual: something of no power or significance: to nullify is also to annul; make void: nullity, synonymous with null as a noun substantive, but a better word.

Their orders are accounted to be null and invalid by many. *Lesley.*

If part of the people be somewhat in the election, you cannot make them nulls or ciphers in the privation or translation. *Bacon.*

A hard body, struck against another hard body, will yield an exteriour sound, in so much as if the percussion be over soft it may induce a nullity of sound; but never an interior sound. *Id.*

Thy fair enchanted cup, and warbling charms, No more on me have power, their force is null'd. *Milton.*

With what impatience must the muse behold The wife, by her procuring husband sold! For tho' the law makes null the adulterous deed Of lands to her, the cuckold may succeed. *Dryden.*

Reason hath the power of nulling or governing all other operations of bodies. *Grew's Cosmologia.*

It can be no part of my business to overthrow this distinction, and to shew the nullity of it; which has been solidly done by most of our polemick writers. *South.*

The jurisdiction is opened by the party, in default of justice from the ordinary, as by appeals or nullities. *Ayliffe.*

The pope's confirmation of the church lands, to those who hold them by king Henry's donation, was null and fraudulent. *Swift.*

By such a change thy darkness is made light, Thy chaos order, and thy weakness might; And He, whose power mere nullity obeys, Who found thee nothing, formed thee for his praise. *Cowper.*

NUMA (Pompilius), the second king of Rome, and the fourth son of Pompilius Pompo, an illustrious Sabine. He had married Tatia, the daughter of king Tadius, and with her remained in his native country, preferring the tranquillity of a private life to the splendor of a court. Upon the death of his wife, with whom he had lived thirteen years, he gave himself up entirely to study; and, leaving the city of Cures, confined himself to the country, in search only of those woods and fountains which religion had made sacred. His recluse life gave rise to the fable, which was very early received among the Sabines, that Numa lived in familiarity with the nymph Egeria. (See EGERIA.) Upon the death of Romulus, the senate and people of Rome despatched Julius Proculus and Valerius Volesus, two senators of distinction, to make him an offer of the kingdom. The Sabine philosopher rejected at first their proposal; but at last yielded, and set out for Rome, where he was received by all ranks of people with joy. Spurius Vettius, the interrex for the day, having assembled the curiæ, he was elected in due form, and the election was unanimously confirmed by the senate. The beginning of his reign was popular; and he dismissed the 300 guards which his predecessor had kept around his person. He was not, like Romulus, fond of war, but applied himself to tame the ferocity of his subjects, to inculcate in their minds a reverence for the Deity, and to quell their dissensions by dividing all the citizens into classes. He established different orders of priests, and taught the Romans not to worship the Deity by images, and hence none appeared in the temples of Rome for 160 years. He encouraged the report of his paying visits to the nymph Egeria, to give sanction to the laws which he introduced. He established the college of the vestals, and told the Romans that the safety of the empire depended upon the preservation of the sacred ancyle or shield, which, it was believed, had dropped from heaven. He dedicated a temple to Janus, which, during his whole reign, remained shut as a mark of peace. After a reign of forty-two years, in which he had given every encouragement to the useful arts, Numa died A. U. C. 82. Not only the Romans, but the neighbouring nations, were eager to pay their last offices to a monarch whom they revered. He left behind him one daughter, called Pompilia, who married Numa Marcius, and became the mother of Ancus Marcius, the fourth king of Rome.

NUMANTIA, a very noble city, the ornament of Hispania Citerior (Florus), celebrated for the long war of twenty years which it maintained against the Romans. Numantia was taken by the Romans, A. U. C. 629, after a siege, productive of hardships to the inhabitants unparalleled in history. See ROME.

NUMB, *adj.* & *v. a.* } Saxon, *benum*, be-
 NUMBNESS, *n. s.* } numb'd; Gothic and
 NUMBNESS. } Arm. *num*. Torpid;
 motionless; senseless; hence chill or cold to
 torpidity: to numb is to reduce to this state.

When we both lay in the field,
 Frozen almost to death, how he did lap me
 Even in his garments, and did give himself
 All thin and naked to the numb-cold night.

Shakespeare.

Bedlam beggars, with roaring voices
 Strike in their numb'd and mortified bare arms
 Piss, wooden pricks, nails, sprigs of rosemary:
 And with this horrible object, from low farms,
 Inforce their charity. *Id. King Lear.*

Stir, nay, come away;

Bequeath to death your numbness; for from him
 Dear life redeem you. *Id. Winter's Tale.*

Leaving long upon any part maketh it numb and
 asleep; for that the compression of the part suffereth
 not the spirits to have free access; and therefore,
 when we come out of it, we feel a stinging or prick-
 ing, which is the re-entrance of the spirits. *Bacon.*

Cold numbness straight bereaves

Her corpse of sense, and the' air her soul receives.
Denham.

She can unlock

The clasping charm, and thaw the numbing spell.
Milton.

Till length of years,

And sedentary numbness, craze my limbs
 To a contemptible old age obscure. *Id.*

Plough naked, swain, and naked sow the land,
 For lazy winter numbs the labouring hand. *Dryden.*

Silence is worse than the fiercest and loudest ac-
 cusions; since it may proceed from a kind of numb-
 ness or stupidity of conscience, and an absolute do-
 minion obtained by sin over the soul, so that it shall
 not so much as dare to complain, or make a stir.

South.

Nought shall avail,

The pleasing song, or well repeated tale,
 When the quick spirits their warm march forbear,
 And numbing coldness has embraced the ear. *Prior.*

If the nerve be quite divided the pain is little,
 only a kind of stupor or numbness.

Wiseman's Surgery.

NUMBER, *v. a.* & *n. s.* } Fr. *nombre*; Lat.

NUMBERER, *n. s.* } *numero*. To count;

NUMBERLESS, *adj.* } reckon; reckon as

one of a kind or sort: a number is the species
 of a quality; any particular aggregate of things;
 many; a multitude, considered in the aggregate;
 harmony (proportions or varieties of sound re-
 duced to numbers), poetry, verse; in grammar,
 the variation that denotes quantity, as one, or
 more than one: a numberer is he who numbers:
 numberless, without number; innumerable.

If a man can number the dust of the earth, then
 shall thy seed also be numbered. *Genesis xiii.*

He was numbered with the transgressors, and bare
 the sin of many. *Isaiah liii. 12.*

I will number you to the sword. *Id. lxx. 12.*

The silver, the gold, and the vessels, were weighed
 by number and by weight. *Ezra viii. 34.*

Of him came nations and tribes out of number.

2 Esd. iii. 7.

Much of that we are to speak may seem to a num-
 ber perhaps tedious, perhaps obscure, dark, and intri-
 cate. *Hooker.*

Hye thee from this slaughter-house,
 Lest thou increase the number of the dead.

Shakespeare.

This is the third time; I hope good luck lies in
 odd numbers; they say there is divinity in odd num-
 bers, either in nativity, chance, or death.

Id. Merry Wives of Windsor.

How many numbers is in nouns?

—Two.

Id.

I forgive all;

There cannot be those numberless offences
 'Gainst me. *Shakespeare.*

Number itself importeth not much in armies, where
 the people are of weak courage: for, as Virgil says,
 it never troubles a wolf how many the sheep be.

Bacon.

If you will some few of you shall see the place;
 and then you may send for your sick, and the rest of
 your number, which ye will bring on land.

Bacon's New Atlantis.

Sir George Summers, sent thither with nine ships
 and five hundred men, lost a great part of their num-
 bers in the isle of Bermudaz. *Heylin.*

The chances and contingencies that trouble us
 are no more to be numbered than the minutes of
 eternity. *Jer. Taylor*

Deserts so great,

Though numberless, I never shall forget. *Denham.*
 Loud as from numbers without number. *Milton.*

Then feed on thoughts that voluntary move,
 Harmonious numbers, as the wakeful bird
 Sings darkling. *Id.*

About his chariot numberless were poured
 Cherub and seraph. *Id. Paradise Lost.*

As one diamond is worth numberless bits of glass:
 so one solid reason is worth innumerable fancies.

Barrow.

In the noun is the variation or change of termina-
 tion to signify a number more than one. When men
 first invented names, their application was to single
 things; but, soon finding it necessary to speak of
 several things of the same kind together, they found
 it likewise necessary to vary or alter the noun.

Clarke's Latin Grammar.

Ladies are always of great use to the party they
 espouse, and never fail to win over numbers.

Addison.

The soul converses with numberless beings of her
 own creation. *Id. Spectator.*

Some convey their instructions to us in the best
 chosen words, others in the most harmonious num-
 bers, some in point of wit, and others in short pro-
 verbs. *Addison.*

Yet should the muses bid my numbers roll
 Strong as their charms, and gentle as their soul.

Pope.

Travels he then a hundred leagues,

And suffers numberless fatigues.

Swift's Miscellanies.

Could I, from Heaven inspired, as sure presage
 To whom the rising year shall prove his last,
 As I can number in my punctual page,

And item down the victims of the past. *Cowper.*

The numberless suckers and straggling branches of
 a fruit tree, if permitted to shoot out unrestrained,
 while they are themselves barren and useless, dimi-
 nish considerably the vigour of the parent stock.

Canning.

NUMBER. (See ARITHMETIC.) Number, says
 Malcolm, is either abstract or applicate: Ab-
 stract, when referred to things in general, without
 attending to their particular properties; and ap-
 plicate, when considered as the number of a par-
 ticular sort of things, as yards, trees, or the like.
 When particular things are mentioned, there is
 always something more considered than barely
 their numbers; so that what is true of number

in the abstract, or when nothing but the number of things is considered, will not be true when the question is limited to particular things: for instance, the number two is less than three; yet two yards is a greater quantity than three inches; because regard must be had to their different natures as well as number, whenever things of a different species are considered; for, though we can compare the number of such things abstractedly, yet we cannot compare them in any applicable sense. And this difference is necessary to be considered, because upon it the true sense, and the possibility or impossibility, of some questions depend. Number is unlimited in respect of increase; because we can never conceive a number so great but still there is a greater. However, in respect of decrease, it is limited; unity being the first and least number, below which therefore it cannot descend, except by subdivision into decimal or other parts, which may also be extended infinitely, at least in idea, if not in fact; for we cannot conceive any particle of matter so small, but that it may be supposed capable of being rendered still smaller, by division and subdivision.

NUMBER, GOLDEN. See CHRONOLOGY, Index.

NUMBERS, ANCIENT. Numbers were by the Jews, as well as the ancient Greeks and Romans, expressed by letters of the alphabet: hence we may conceive how imperfect and limited their arithmetic was, because the letters could not be arranged in a series, or in different columns, convenient for ready calculation. The invention of the arithmetical figures which we now make use of, and particularly the cypher, has given us a vast advantage over the ancients in this respect. (See ARITHMETIC, Index.) The Jewish cabbalists, the Grecian conjurers, and the Roman augurs, had a great veneration for particular numbers, and the result of particular combinations of them.

NUMBERS, BOOK OF, the fourth book of the Pentateuch, taking its denomination from its numbering the families of Israel. A great part of this book is historical, relating to several remarkable passages in the Israelites' march through the wilderness. It contains a distinct relation of their several movements from one place to another, or their forty-two stages through the wilderness. But the greatest part of this book is spent in enumerating those laws and ordinances, whether civil or ceremonial, which were given by God, but not mentioned before in the preceding books.

NUM'ERAL, *adj.*

NUM'ERABLE,

NUM'ERALLY, *adv.*

NUM'ERARY, *adj.*

NUMERA'TION, *n. s.*

NUMERA'TOR, *n. s.*

NUMER'ICAL, *adj.*

NUMER'ICALLY, *adv.*

NUM'ERIST, *n. s.*

NUMEROS'ITY,

NUM'EROUS, *adj.*

NUM'EROUSNESS, *n. s.*

number contained; a rule of arithmetic: a numerator is a person who numbers; or a given number, the measure of others: numerical, denoting or pertaining to numbers; identical; the

Fr. *numeral, numérateur, numeration*; Lat. *numerus, numeratio, numerator, numerosus*. Relating to numbers: numerable is capable of being numbered: numery, any thing pertaining to a certain number: numeration, the act or art of numbering;

same not only in kind but number: numerist, one who deals in or reckons numbers: numerosity, the state of being numerous: numerous, many; containing many; containing musical numbers; harmonious; melodious: numerosness, the quality of being numerous; harmony.

Many of our schisms in the West were never heard of by the *numerous* Christian churches in the east of Asia. *Ledy.*

Queen Elizabeth was not so much observed for having a *numerous*, as a wise counsel. *Bacon.*

The blasts and undulatory breaths thereof maintain no certainty in their course; nor are they *numerally* feared by navigators. *Browne.*

In the legs or organs of progression, in animals, we may observe an equality of length, and parity of *numeration*. *Id.*

We cannot assign a respective fatality unto each which is concordant unto the doctrine of the *numerals*. *Id.*

Of assertion if *numerosity* of assertors were a sufficient demonstration, we might sit down herein as an unquestionable truth. *Id.*

Thy heart, no ruder than the rugged stone, I might, like Orpheus, with my *numerous* moan Melt to compassion. *Waller.*

I must think it improbable that the sulphur of antimony would be but *numerically* different from the distilled butter or oil of roses. *Boyle.*

His verses are so *numerous*, so various, and so harmonious, that only Virgil, whom he professedly imitated, has surpassed him. *Dryden.*

That which will distinguish his style is, the *numerosness* of his verse. There is nothing so delicately turned in all the Roman language. *Id.*

Numeration is but still the adding of one unit more, and giving to the whole a new name or sign, whereby to know it from those before and after. *Locke.*

Some who cannot retain the several combinations of numbers in their distinct orders, and the dependence of so long a train of *numerical* progressions, are not able all their lifetime regularly to go over any moderate series of numbers. *Id.*

The *numerical* characters are helps to the memory, to record and retain the several ideas about which the demonstration is made. *Id.*

Contemplate upon his astonishing works, particularly in the resurrection and reparation of the same *numerical* body, by a re-union of all the scattered parts. *South.*

A supernumerary canon, when he obtains a prebend, becomes a *numery* canon. *Ayliffe's Parergon.*

Put thy little state in good order; govern wisely and holily those *numerous* people which are contained in so little a kingdom; that is to say, that multitude of affections, thoughts, opinions, and passions, which are in thine heart. *Mason.*

Words none, things *numerous* it contains:

And, things with words compared,

Who needs be told, that has his brains,

Which merit most regard?

To the wall, with Hate and Hunger,

Numerous as wolves and stronger,

On they sweep.

In Time's pursuits men ran till out of breath:

The astronomer soared up, and counted stars,

And gazed upon the heaven's bright face,

Till he dropped down dim-eyed into the grave:

The *numerist*, in calculations deep,

Grew gray.

Pollok.

NUMERAL CHARACTERS OF THE ARABS are those figures which are now used in all the operations of arithmetic in every nation of Europe. A writer in the *Gentleman's Magazine* thus endeavours to prove that the Arabs derived their notations from the Greeks:—'I maintain,' says he, 'that the Indians received their numeral characters from the Arabians, and the Arabians from the Greeks, as from them they derived all their learning, which in some things they improved, but for the most part have altered. The numerical figures which they received from the Greeks are proofs of this alteration; which is so great, that without particular attention one can scarcely discover in them the vestiges of their origin. But when we compare them carefully, and without prejudice, we find in them manifest traces of the Greek figures. The Greek numerical figures were no other than the letters of their alphabet. A small stroke was the mark of unity. The β , being abridged of its two extremities, produced the 2. If you incline the γ a little on its left side, and cut off its foot, and make the left horn round towards the left side, you will produce a 3. The Δ makes the 4, by raising the right leg perpendicularly, and lengthening it a little below the base, and lengthening the base on the left side. The ϵ forms the 5, by turning the lowest semicircle towards the right, which before was turned towards the left side. The number 5 forms the 6 by having its head taken off, and its body rounded. ζ , by taking away the base, makes the 7. If we make the top and bottom of θ round, we shall form an 8. The θ is the 9 with very little alteration. The cypher 0 was only a point, to which one of the figures was added to make it stand for ten times as much. It was necessary to mark this point very strongly: and, in order to form it better, a circle was made, which was filled up in the middle; but that circumstance was afterwards neglected. Theophrastus, an historian of Constantinople, who lived in the ninth century, says expressly, that the Arabians retained the Greek figures, having no characters in their language to represent all the numbers. The Greeks observed in their numbers the decuple progression, which the Arabians have retained.' That this reasoning is plausible will hardly be questioned; but whether it be conclusive our readers must determine.

NUMERAL LETTERS, OR NUMERALS, those letters of the alphabet which are generally used for figures; as I, one; V, five; X, ten; L, fifty; C, 100; D, 500; M, 1000, &c. It is not agreed how the Roman numerals originally received their value. It has been supposed that the Romans used M to denote 1000, because it is the first letter of mille, the Latin for 1000; C to denote 100, because it is the first letter of centum, the Latin for 100; that D, being formed by dividing the old M in the middle, was therefore appointed to stand for 500, or half as much as the M's ood for when it was whole; or, more probably, that D stands for dimidium mille, the half of 1000: and that L, being half a C, was, for the same reason, used for fifty; that V stood for five, because it is the fifth vowel; that X stood for ten, because it contains V twice, one of them

inverted; and that I was used for one, because it is the first letter of initium, the beginning. But all these are fanciful derivations; and the following are perhaps equally so, though some think they afford the most natural account of the matter. The Romans probably put down a single stroke, I, for one; this I they doubled, trebled, and quadrupled, to express two, three, and four; thus II. III. IIII. So far they could easily number the strokes with a glance of the eye. But they found that, if more were added, it would be necessary to tell the strokes one by one; they therefore expressed five by joining two strokes together in an acute angle, thus, V, which is the more probable, as the progression of the Roman numbers is from five to five, i. e. from the fingers on one hand to the fingers on the other. After they had made this acute angle V, for five, they added the single strokes to it to the number of four, thus, VI. VII. VIII. IIIII, and then, to prevent confusion, they doubled their acute angle by prolonging the two lines beyond their intersection, thus, X to denote two fives, or ten. After this they doubled, trebled, and quadrupled, this double acute angle thus, XX. XXX. XXXX. They then joined two single strokes in another form, and, instead of an acute angle, made a right angle L to denote fifty. When this fifty was doubled, they then doubled the right angle thus, L, to denote 100; and having numbered this double right angle four times, thus, LL. EEE. LEEE. when they came to the fifth number as before, they reversed it, and put a single stroke before it, thus, LI, to denote 500; and, when this 500 was doubled, then they also doubled their double right angle, setting two double right angles opposite to each other, with a single stroke between them, thus, LL, to denote 1000: when this note for 1000 had been four times repeated, then they put down LI, for 5000, EEE, LI, for 10,000, and LI, LI, for 50,000, and EEE, LI, LI, LI, for 1,000,000. That the Romans did not originally write M for 1000, and C for 100, but square characters, as they are written above, we are expressly informed by Paulus Manutius; but the corners of the angles being cut off by the transcribers for despatch, these figures were gradually brought into what are now numeral letters. When the corners of LI were made round, it stood thus, CI, which is so near the Gothic α , that it soon deviated into that letter: so LI having the corner made round, it stood thus, IC, and then easily deviated into D. E also became a plain C by the same means; the single rectangle which denoted fifty was, without alteration, a capital L the double acute angle was an X; the single acute angle a V consonant; and a plain single stroke the letter I; and thus these seven letters, M, D, C, L, X, V, I, became numerals.—See ARITHMETIC.

NUMIDA, in ornithology, a genus belonging to the order gallinæ. On each side of the head there is a kind of colored fleshy horn; and the beak is serrated near the nostrils.

N. cristata, the crested guinea-hen, a species mentioned by Latham, inhabiting Africa. Perhaps it may have some relation to the crested

sort which *Marcgrave* mentions to have seen, and which came from *Sierra Leone*. This had a kind of membranous collar about the neck, was of a bluish-ash color, and had a large roundish black crest. *Buffon*, who describes it at great length, calls it *la peintade*. *Linnaeus* and *Gmelin* call it *numida meleagris*, &c. *Ray* and *Willoughby* call it *gallus* and *gallina Guineensis*, &c. *Mr. Pennant* contends, and seems to prove, that the pintadoes had been early introduced into Britain, at least prior to the year 1277. But they seem to have been much neglected, on account of the difficulty of rearing them; for they occur not in our ancient bills of fare. They have a double caruncle at the chaps, and no fold at the throat.

N. meleagris, the Guinea hen, is a native of Africa. It is larger than a common hen. Its body is sloped like that of a partridge, and its color is all over a dark gray, very beautifully spotted with small white specks; there is a black ring round the neck; its head is reddish, and it is blue under the eyes. They naturally herd together in large numbers, and breed up their young in common; the females taking care of the broods of others, as well as of their own. *Barbut* informs us, that in Guinea they go in flocks of 200 or 300, perch on trees, and feed on worms and grasshoppers; that they are run down and taken by dogs; and that their flesh is tender and sweet, generally white, though sometimes black. They breed very well with us. *Mr. Latham* observes 'that the native place of this bird is without doubt Africa, and that it is the *meleagris* of old authors. It is supposed originally to have come from Nubia, and was esteemed in the Roman banquets. It has been met with wild, in flocks of 200 or 300, by various travellers. *Dampier* found them in numbers in the island of Mayo; and *Forster* speaks of them as numerous at St. Jago; but they have been transported into the West Indies and America, and are now in a wild state in those places as well as domesticated.' The white-breasted one is a mere variety, of which there are many: it is mostly found in Jamaica.

N. mitrata, is a different and not a common species: it inhabits Madagascar and Guinea. *Pallas* seems to think that it may be the bird mentioned by *Columella* as differing from the common one; and will account for *Pliny's* having thought the *numida* and *meleagris* to be different birds.

NUMIDIA, an ancient kingdom of Africa, bounded on the north by the Mediterranean Sea; on the south by *Gætulia*, or part of Libya Interior; on the west by the *Mulucha*, a river which separated it from Mauritania; and on the east by the *Tusca*, another river that bounded it in common with Africa Propria. *Dr. Shaw* has rendered it probable that the river formerly named *Malva*, *Malvana*, *Mulucha*, or *Molochath*, is the same with that now called *Mullooiah* by the Algerines; in which case the kingdom of Numidia must have extended upwards of 500 miles in length; its breadth, however, cannot be so well ascertained; but, supposing it to have been the same with that of the present kingdom of Algiers, in the narrowest part it must have been at least forty miles broad, and in the widest

upwards of 100. This country included two districts, one inhabited by the *Massyli*, and the other by the *Masæsyli*; the latter being also called in after times Mauritania Cæsariensis, and the former Numidia Propria. The country of the *Massyli*, or, as some call it, Terra Metagonitis, was separated from the proper territory of Carthage by its eastern boundary, the river *Tusca*, and from the kingdom of the *Masæsyli*, or Mauritania Cæsariensis, by the river *Ampsaga*. It seems to correspond with that part of the province of Constantina, lying between the *Zaine* and the *Wed al Kibeer*, which is above 130 miles long, and more than 100 broad. The sea-coast of this province is for the most part mentioned as rocky, answering to the appellation given to it by *Abulfeda*, viz. *El Edwaa*, the high or lofty. It is far from being equal in extent to the ancient country of the *Masæsyli*, which *Strabo* informs us was yet inferior to the country of the *Massyli*. Its capital was *Cirta*, a place of very considerable note among the ancients. The most celebrated antiquarians think that the tract extending from the isthmus of Suez to the lake *Tritonis* was chiefly peopled by the descendants of *Mizraim*, and that the posterity of his brother *Phut* spread themselves all over the country between that lake and the Atlantic Ocean. *Herodotus* countenances this; for he tells us, that the *Libyan Nomades*, whose territories on the west were bounded by the *Triton*, agreed in their customs and manners with the Egyptians; but that the Africans, from that river to the Atlantic Ocean, differed in almost all points from them. *Ptolemy* mentions a city called *Putea*, near *Adrametum*; and *Pliny*, a river of Mauritania *Tingitana*, known by the name of *Fut*, or *Phut*; and the district adjacent to this river was called *Regio Phutensis*, which plainly alludes to the name of *Phut*.

The history of Numidia, during many of the early ages, is buried in oblivion. It is probable, however, that, as the Phœnicians were masters of a great part of the country, these transactions had been recorded, and generally known to the Carthaginians. *Jarbas*, or *Hiarbas*, probably reigned here as well as in Africa Proper, if not in Mauritania, and other parts of Libya, when *Dido* began to build *Byrsa*. *Justin* says that, about the age of *Herodotus*, the people of this country were called both Africans or Libyans, and Numidians. He likewise intimates that about this time the Carthaginians vanquished both the Moors or Mauritians, and Numidians; in consequence of which they were excused from paying the tribute which had hitherto been demanded of them. After the conclusion of the first Punic war the African troops carried on a bloody contest against their masters the Carthaginians; and the most active in this rebellion, according to *Diodorus Siculus*, were a part of the Numidian nation named *Micatanians*. This so incensed the Carthaginians, that, after *Hamilcar* had either killed or taken prisoners all the mercenaries, he sent a large detachment to ravage the country of those Numidians. That detachment executed his orders with the utmost cruelty, plundering the district, and crucifying all the prisoners without distinction. This filled

the rest with such indignation and resentment, that both they and their posterity ever afterwards bore an implacable hatred to the Carthaginians. In the time of the second Punic war, Syphax, king of the Massesyli, entered into an alliance with the Romans, and attacked the Carthaginians. This induced Gala, king of the Massyli, to conclude a treaty with the Carthaginians, in consequence of which his son Masinissa marched at the head of a powerful army to give Syphax battle. The contest ended in favor of Masinissa; 30,000 Massesyli were put to the sword, and Syphax driven into Mauritania; and similar misfortunes attended Syphax in another engagement, where his troops were entirely defeated and dispersed.

Gala dying, whilst his son Masinissa was acting at the head of the Numidian troops sent to the assistance of the Carthaginians in Spain, his brother Desalces, according to the rules of succession in Numidia, took possession of the Massylian throne. That prince dying soon after, Capusa his eldest son succeeded him. But he did not long enjoy his high dignity; for one Mezetus a person of the royal blood, but an enemy to the family of Gala, excited a great part of his subjects to revolt. A battle soon took place between him and Capusa, in which the latter was slain, with many of the nobility, and his army entirely defeated. But, though Mezetus thus became possessed of the sovereignty, he did not think proper to assume the title of king, but styled himself guardian to Lacumaces, the surviving son of Desalces, whom he graced with the royal title. To support himself in his usurpation he married the dowager of Desalces, who was Hannibal's niece, and consequently of the most powerful family in Carthage. To attain the same end, he sent ambassadors to Syphax, to conclude a treaty of alliance with him. In the mean time Masinissa, receiving advice of his uncle's death, and his cousin's slaughter, and of Mezetus's usurpation, immediately passed over to Africa, and went to the court of Bocchar, king of Mauritania, to solicit succours. Bocchar, sensible of the great injustice done Masinissa, gave him a body of 4000 Moors to escort him to his dominion. His subjects, having been apprised of his approach, joined him upon the frontiers with a party of 500 men. The Moors, in pursuance of their orders, returned home as soon as Masinissa reached the confines of his kingdom. Notwithstanding which, and the small body that declared for him, having accidentally met Lacumaces at Thapsus with an escort going to implore Syphax's assistance, he drove him into the town, which he carried by assault, after a faint resistance. However, Lacumaces, with many of his men, escaped to Syphax. The fame of this exploit gained Masinissa so great credit that the Numidians flocked to him from all parts, and, amongst the rest, many of his father Gala's veterans, who pressed him to make a speedy and vigorous push for his hereditary dominions. Lacumaces having joined Mezetus with a reinforcement of Massesylians, which he had prevailed upon Syphax to send to the assistance of his ally, the usurper advanced at the head of a

numerous army to offer Masinissa battle; which that prince, though much inferior in numbers did not decline. Hereupon an engagement ensued; which, notwithstanding the inequality of numbers, ended in the defeat of Lacumaces. The immediate consequence of this victory of Masinissa was a quiet and peaceable possession of his kingdom; Mezetus and Lacumaces, with the few that attended them, flying into the territories of Carthage.

Notwithstanding this success, Masinissa being apprehensive that he should be obliged to sustain a war against Syphax, he offered to treat Lacumaces with as many marks of distinction as his father Gala had Desalces, provided that prince would put himself under his protection. He also promised Mezetus pardon, and a restitution of all the effects forfeited by his treasonable conduct, if he would make his submission to him. Both of them readily complied with the proposal, and immediately returned home; so that the tranquillity and repose of Numidia would have been settled upon a solid and lasting foundation, had not this been prevented by Asdrubal, who was then at Syphax's court. He insinuated to that prince, 'that he was greatly mistaken, if he imagined Masinissa would be satisfied with his hereditary dominions: that he was a prince of much greater capacity and ambition than either his father Gala, his uncle Desalces, or any of his family. And that, in fine, unless this rising flame was extinguished before it came to too great a head, both the Massesylan and Carthaginian states would be infallibly consumed by it.' Syphax, alarmed by these suggestions, advanced with a numerous body of forces into a district then in possession of Masinissa. This brought on a general action between these two princes; wherein the latter was totally defeated, his army dispersed, and he himself obliged to fly to the top of mount Balbus, attended only by a few of his horse. Such a decisive battle at this juncture, before Masinissa was fixed on the throne, could not but put Syphax into possession of the kingdom of the Massyli. Masinissa in the mean time made nocturnal incursions from his post upon mount Balbus, and plundered all the adjacent country, particularly that part of the Carthaginian territory contiguous to Numidia. This district he not only thoroughly pillaged, but likewise laid waste with fire and sword, carrying off an immense booty, which was bought by some merchants, who had put into one of the Carthaginian ports for that purpose. In fine, he did the Carthaginians more damage, not only by committing such dreadful devastations, but by massacring and carrying into captivity vast numbers of their subjects on this occasion, than they could have sustained in a pitched battle, or one campaign of a regular war. Syphax, at the pressing and reiterated instances of the Carthaginians, sent Bocchar, one of his most active commanders, with a detachment of 4000 foot, and 2000 horse, to reduce this pestilent gang of robbers, promising him a great reward if he could bring Masinissa either alive or dead. Bocchar, watching an opportunity, surprised the Massylians, as they were straggling about the country without any

order or discipline; so that he took many prisoners, dispersed the rest, and pursued Masinissa himself, with a few of his men, to the top of the mountain where he had before taken post. Considering the expedition as ended, he not only sent many head of cattle, and the other booty that had fallen into his hands, to Syphax, but likewise all the forces, except 500 foot and 200 horse. With this detachment he drove Masinissa from the summit of the hill, and pursued him through several narrow passes and defiles, as far as the plains of Clupea. Here he so surrounded him, that all the Massylians except four, were put to the sword, and Masinissa himself, after having received a dangerous wound, escaped with the utmost difficulty. As this was effected by crossing a rapid river, in which attempt two of his four attendants perished in the sight of the detachment that pursued him, it was rumored all over Africa that Masinissa also was drowned. For some time he lived undiscovered in a cave, where he was supported by the two horsemen that had made their escape with him. But having cured his wound, by the application of some medicinal herbs, he boldly began to advance towards his own frontiers. In his march he was joined by about forty horse, and, soon after his arrival among the Massyli, so many people flocked to him from all parts that out of them he formed an army of 6000 foot and 4000 horse. With these forces he not only reinstated himself in the possession of his dominions, but likewise laid waste the borders of the Massyli. This so irritated Syphax that he immediately assembled a body of troops, and encamped very commodiously upon a ridge of mountains between Cirta and Hippo. His army he commanded in person; and detached his son Vermina, with a considerable force, to take a compass, and attack the enemy in the rear. In pursuance of his orders, Vermina set out in the beginning of the night, and took post in the place appointed him, without being discovered by the enemy. In the mean time Syphax decamped, and advanced towards the Massyli, to give them battle. When he had possessed himself of a rising ground that led to their camp, and concluded that his son Vermina must have formed the ambuscade behind them, he began the fight. Masinissa being advantageously posted, and his soldiers distinguishing themselves in an extraordinary manner, the dispute was long and bloody. But Vermina unexpectedly falling upon their rear, and thus obliging them to divide their forces, which were scarcely able before to oppose the main body under Syphax, they were soon thrown into confusion, and forced to betake themselves to a precipitate flight. All the avenues being blocked up, partly by Syphax and partly by his son, such a dreadful slaughter was made of the unhappy Massyli, that only Masinissa himself, with sixty horse, escaped to the Lesser Syrtis. Here he remained betwixt the confines of the Carthaginians and Garamantes, till the arrival of Lælius and the Roman fleet on the coast of Africa, when he joined with the Romans; and by the assistance of Lælius, at last reduced Syphax's kingdom. See *ROME*. According to Zonoras, Ma-

sinissa and Scipio, before the memorable battle of Zama, deprived Hannibal by stratagem of some advantageous posts; which greatly contributed to the victory the Romans obtained. At the conclusion, therefore, of the second Punic war, he was amply rewarded by the Romans for the important services he had done them. As for Syphax, after the loss of his dominions, he was kept in confinement for some time at Alba; whence being removed to grace Scipio's triumph, he died at Tibur in his way to Rome. Zonoras adds, that his corpse was decently interred; that all the Numidian prisoners were released; and that Vermina, by the assistance of the Romans, took peaceable possession of his father's throne. However, part of the Massylian kingdom had been before annexed to Masinissa's dominions, to reward that prince for his singular fidelity and attachment to the Romans. A short time before the beginning of the third Punic war he again attacked the Carthaginians, and by drawing a line of circumvallation around their army, posted upon an eminence, under the command of Asdrubal, Masinissa cut off all manner of supplies from them; which introduced both the plague and famine into their camp. As the body of Numidian troops employed in this blockade was not near so numerous as the Carthaginian forces, the line here mentioned must have been extremely strong, and the effect of great labor and art. The Carthaginians, finding themselves reduced to the last extremity, concluded a peace upon the following terms; which Masinissa dictated:—1. That they should deliver up all deserters. 2. That they should recal their exiles, who had taken refuge in his dominions. 3. That they should pay him 5000 talents of silver within fifty years. 4. That their soldiers should pass under the yoke, each carrying off only a single garment. As Masinissa himself, though between eighty and ninety years of age, conducted the whole enterprise, he must have been extremely well versed in fortification, and other branches of the military art. Soon after, the consuls landed an army in Africa, in order to lay siege to Carthage, without imparting to Masinissa their design. This not a little chagrined him, as it was contrary to the former practice of the Romans; who, in the preceding war, had communicated their intentions to him, and consulted him on all occasions. When, therefore, the consuls applied to him for a body of his troops to act in concert with their forces, he answered, 'that they should have a reinforcement when they stood in need of it.' It could not but be provoking to him, that after he had extremely weakened the Carthaginians, and even brought them to the brink of ruin, his pretended imperious friends should come to reap the fruits of his victory, without giving him the least intelligence of it. However, his mind soon returned to its natural bias in favor of the Romans. Finding his end approaching, he sent to Æmilianus, then a tribune in the Roman army, to desire a visit from him. What he proposed by this visit, was to invest him with full powers to dispose of his kingdom and estate as he should think proper, for the benefit of his children. The high

idea he had entertained of that young hero's abilities and integrity induced him to take this step. But, believing that death would not permit him to have a personal conference with Æmilianus upon this subject, he informed his wife and children, in his last moments, that he had empowered him to dispose in an absolute manner of all his possessions, and to divide his kingdom amongst his sons. To which he subjoined, 'I require, that whatever Æmilianus may decree, shall be executed as punctually as if I myself had appointed it by my will.' Before the arrival of the tribune he expired.

During his youth he had met with strange reverses of fortune. His kingdom finally, however, extended from Mauritania to the western confines of Cyrenaica; whence it appears, that he was one of the most powerful princes of Africa. Many of the inhabitants of this vast tract he civilised, teaching them to cultivate their soil, and to reap those natural advantages which the fertility of their country offered them. He was of a more robust habit of body than any of his contemporaries, being blessed with the greatest health and vigor to the last, and his youngest son, Stembal, was only four years old at his decease. Though above ninety years of age, he performed all the exercises used by young men, and always rode without a saddle. According to Appian, he left a numerous and well-disciplined army, and an immense quantity of wealth behind him. Of fifty-four sons that survived him, only three were legitimate, to wit, Micipsa, Gulussa, and Mastanabal. Æmilianus, arriving at Cirta after he had expired, divided his kingdom, or rather the government of it, amongst these three, though to the others he gave considerable possessions. To Micipsa, the eldest, who was of a pacific disposition, he assigned Cirta, the metropolis, for the place of his residence, in exclusion of the others. Gulussa, the next to him, being a prince of a military genius, had the command of the army, and the transacting of all affairs relative to peace or war. And Mastanabal, the youngest, had the administration of justice allotted him as an employment suitable to his education. They enjoyed in common the immense treasures Masinissa had amassed, and were all of them dignified by Æmilianus with the royal title. After he had made these dispositions, he departed from Cirta, taking with him a body of Numidian troops, under the conduct of Gulussa, to reinforce the Roman army that was then acting against the Carthaginians.

Mastanabal and Gulussa died soon after their father, and Micipsa therefore became sole monarch of Numidia. In his reign, according to Orosius, a great part of Africa was covered with locusts which destroyed all the produce of the earth, and even devoured dry wood. But at last they were all carried by the wind into the African Sea, out of which being thrown in vast heaps upon the shore, a tremendous plague ensued. In Numidia alone 800,000 men perished, and in Africa Propria 200,000; amongst the rest, 30,000 Roman soldiers quartered in and about Utica for the defence of the last province. At Utica, in particular, the mortality raged to such a degree, that 1500 dead bodies were carried

out of one gate in a day. Micipsa had two sons, Adherbal and Hiempsal, whom he educated in his palace, together with his nephew Jugurtha. That young prince was the son of Mastanabal; but, his mother having been only a concubine, Masinissa had taken no great notice of him. However, Micipsa, considering him as a prince of the blood, took as much care of him as he did of his own children. Jugurtha became very handsome, endued with great strength of body, and adorned with great intellectual endowments. He exercised himself in running, riding, hurling the javelin, and other manly exercises, suited to the martial genius of the Numidians. The chase was his chief delight; but it was that of lions and other savage beasts. His talents at first charmed Micipsa, who thought them an ornament to his kingdom. But he soon began to reflect, that he was considerably advanced in years, and his children in their infancy; that mankind naturally thirst after power, and often stick at nothing to gratify their ambition. These reflections excited his jealousy, and determined him to expose Jugurtha to various dangers, some of which he hoped might prove fatal to him. For this purpose he gave him the command of a body of forces which he sent to assist the Romans, who were then besieging Numantia. But Jugurtha, by his admirable conduct, not only escaped all danger, but acquired the esteem of the whole army, and Scipio sent a high character of him to his uncle Micipsa, while he also gave him some prudent advice in relation to his future conduct. The heroic bravery he had shown in Spain, his undaunted courage, joined to the utmost calmness of mind, and above all the advantageous testimonials of his conduct given by Scipio, attracted a universal esteem. Micipsa himself, charmed with the high idea the Roman general had entertained of his merit, changed his behaviour towards him; resolving, if possible, to win his affection by kindness. He therefore adopted him, and declared him joint heir with his two sons to the crown. Finding, some few years afterwards, that his end approached, he sent for all three to his bed side; where, in the presence of the whole court, he desired Jugurtha to recollect with what extreme tenderness he had treated him, and consequently to consider how well he had deserved at his hands. He then intreated him to protect his children on all occasions; who, being before related to him by the ties of blood, were now by their father's bounty become his brethren. He farther insinuated, that neither arms nor treasures constitute the strength of a kingdom, but friends, who are neither won by arms nor gold, but by real services, and an inviolable fidelity. Then, addressing himself to Adherbal and Hiempsal, 'And you (said he) I enjoin to pay the highest reverence to Jugurtha. Endeavour to imitate, and if possible surpass his exalted merit, that the world may not hereafter observe Micipsa's adopted son to have reflected greater glory upon his memory than his own children.'

Micipsa's kindness made no impression on the mind of the ungrateful Jugurtha. Soon after the old king's death, he found means to assassinate Hiempsal in the city of Thirmita where

his treasures were deposited, and drive Adherbal out of his dominions. That unhappy prince fled to Rome, where he endeavoured to engage the senate to espouse his quarrel; but, notwithstanding the justice of his cause, Jugurtha's ambassadors, by distributing vast sums of money amongst them, brought them so far over, that a majority palliated his inhuman proceedings. This encouraged those ministers to pretend that Hiempsal had been killed by the Numidians on account of his excessive cruelty, and that Adherbal was the aggressor in the late troubles. They therefore intreated the senate to judge of Jugurtha's behaviour in Africa from his conduct at Numantia, rather than from the suggestion of his enemies. Upon which the majority of the senate declared in his favor. A few, however, who were not abandoned to corruption, insisted upon bringing him to condign punishment. But as they could not prevail, he had the best part of Numidia allotted him, and Adherbal was forced to rest satisfied with the remainder. Jugurtha, finding now that every thing was venal at Rome, thought he might pursue his towering projects without any obstruction from that quarter. He therefore threw off the mask, and attacked his cousin by open force. As Adherbal was a prince of a pacific disposition, and in almost all respects the reverse of Jugurtha, he was by no means a match for him. The latter therefore pillaged his territories, stormed several of his fortresses, and overran a great part of his kingdom without opposition. Adherbal, depending on the friendship of the Romans, which his father in his last moments assured him would be a stronger support to him than all the troops and treasures in the universe, despatched deputies to Rome to complain of these hostilities. But, whilst he lost his time in sending thither fruitless deputations, Jugurtha overthrew him in a pitched battle, and soon after shut him up in Cirta. During the siege of this city, Roman commissioners arrived there, to persuade both parties to an accommodation; but, finding Jugurtha untractable, they returned without so much as conferring with Adherbal. A second deputation, composed of senators, with Æmilius Scaurus, president of the senate, at their head, landed some time after at Utica, and summoned Jugurtha to appear before them. That prince at first seemed to be under dreadful apprehensions, especially as Scaurus reproached him with his enormous crimes, and threatened him with the resentment of the Romans, if he did not immediately raise the siege of Cirta. However, the Numidian, by his address and the irresistible power of his gold, so mollified Scaurus, that he left Adherbal at his mercy. In fine, Jugurtha had at last Cirta surrendered to him, upon condition only that he should spare the life of Adherbal. But the merciless tyrant, when he had obtained possession of the town, ordered him to be put to a most cruel death. The merchants likewise, and all the Numidians in the place capable of bearing arms, he caused, without distinction, to be put to the sword. Rome was struck with horror at the news of this tragical event. Yet the venal senators still concurred with Jugurtha's ministers in palliating his enormous crimes. Notwithstanding which,

the people, excited by Caius Memmius their tribune, who bitterly inveighed against the venality of the senate, resolved not to let so flagrant an instance of villany go unpunished. This induced the senate likewise to declare their intention to chastise Jugurtha. For this purpose an army was levied to invade Numidia, and the command of it given to the consul Calpurnius Bestia, a person of great abilities but of the most insatiable avarice. Jugurtha, being informed of these great preparations, sent his son to Rome, to avert the impending storm, plentifully supplied with money. But Bestia, in the hopes of great advantages from an invasion of Numidia, defeated all his intrigues, and had a decree passed, ordering him and his attendants to depart Italy in ten days, unless they were come to deliver up the king himself, and all his territories, to the republic. This decree being notified to them, they returned without so much as having entered the gates of Rome; and the consul soon after landed with a powerful army in Africa. For some time he carried on the war very briskly; he reduced several strong holds, and took many Numidian prisoners. But, upon the arrival of Scaurus, a peace was granted Jugurtha upon advantageous terms. That prince coming from Vaca, the place of his residence, to the Roman camp, to confer with Bestia and Scaurus, and the preliminaries of the treaty being immediately after settled between them in private conferences, every one at Rome was convinced that the president of the senate and the consul had sacrificed the republic to their avarice. The indignation therefore of the people in general displayed itself in the strongest manner. Memmius also fired them with his speeches. It was therefore resolved to despatch the prætor Cassius, a man they could confide in, to Numidia, to prevail upon Jugurtha to come to Rome, that they might learn from himself which of their generals and senators had been seduced by the pestilential influence of corruption. Upon his arrival there he bribed one Bæbius Salca, a man of great authority amongst the plebeians, but of insatiable avarice, by whose assistance he not only eluded all the endeavours of the people of Rome to bring him to justice, but likewise enabled Bomilcar, one of his attendants, to get Massiva, an illegitimate son of Micipsa, assassinated in the streets of Rome. That young prince was advised by many Romans of probity, well-wishers to the family of Masinissa, to apply for the kingdom of Numidia; which coming to Jugurtha's ears, he prevented the application by this execrable step. However, he was obliged to leave Italy immediately. Jugurtha had scarcely set foot in Africa, when he received advice that the senate had annulled the shameful peace concluded with him by Bestia and Scaurus. Soon after, the consul Albinus transported a Roman army into Numidia. Flattering himself with the hopes of reducing Jugurtha to reason, he found himself deceived; for that crafty prince, by various artifices, so amused and imposed upon Albinus, that nothing of moment happened that campaign. His brother Aulus, who succeeded him in the command of the army, was still more unsuccessful; for after

a fruitless attempt to besiege Suthel, where the king's treasures were deposited, he marched his forces into a defile out of which he found it impossible to extricate himself. He therefore was obliged to submit to the ignominious ceremony of passing under the yoke, with all his men, and to quit Numidia in ten days, to save his troops from immediate destruction. This scandalous treaty was declared void at Rome, as being concluded without the authority of the people. The Roman troops retired into Africa Propria, which they had now reduced into the form of a Roman province. In the mean time Caius Mamilius Limetanus, tribune of the people, excited the plebeians to enquire into the conduct of those persons by whose assistance Jugurtha had eluded all the decrees of the senate. This occasioned a great ferment, which produced a prosecution of the guilty senators, that was carried on for some time with the utmost zeal. Lucius Metellus, the consul during these transactions, had Numidia assigned him for his province, and was appointed general of the army against Jugurtha. As he entirely disregarded wealth, the Numidian found him superior to all his offers. Jugurtha was therefore now forced to regulate his conduct according to the motions of Metellus with the greatest caution; and to exert his utmost bravery. The Romans soon reduced Vacca, a large opulent city, and the most celebrated mart in Numidia. They also defeated Jugurtha in a pitched battle; overthrew Bomilcar, one of his generals, upon the banks of the Muthullus; and, in fine, forced Jugurtha to take shelter in a place rendered almost inaccessible by rocks and woods. However, Jugurtha exerted himself surprisingly, exhibiting the courage, abilities, and attention of a consummate general, to whom despair administers fresh strength. But his troops could not make head against the Romans; they were again worsted by Marius, though they obliged Metellus to raise the siege of Zama. Jugurtha, therefore, finding his country every where ravaged, his most opulent cities plundered, his fortresses reduced, his towns burnt, vast numbers of his subjects put to the sword and taken prisoners, began to think seriously of coming to an accommodation with the Romans. His favorite Bomilcar, in whom he reposed the highest confidence, but who had been gained over by Metellus, observing this disposition, persuaded him to deliver up his elephants, money, arms, horses, and deserters, into the hands of the Romans. Some of these last, to avoid punishment, retired to Bocchus, king of Mauritania, and listed in his service. But Metellus, ordering Jugurtha to repair to Tisidium, a city of Numidia, and wait farther directions, and he refusing, hostilities were renewed with greater fury than ever. Fortune now seemed to declare in favor of Jugurtha: he retook Vacca, and massacred all the Roman garrison, except Turpillius the commandant. But soon after a Roman legion seized again upon it, and treated the inhabitants with the utmost severity. About this time Gauda, a son of Mastanabal, whom Micipsa in his will had appointed to succeed if his two legitimate sons

and Jugurtha died without issue, wrote to the senate in favor of Marius, who was then endeavouring to supplant Metellus. The Roman, soothing the vanity of Gauda, assured him that, as he was the next heir to the crown, he might depend upon being fixed upon the Numidian throne, as soon as Jugurtha was either killed or taken; and that this must soon happen, when once he appeared at the head of the Roman army with an unlimited commission. Soon after, Bomilcar and Nabdalsa formed a design to assassinate Jugurtha at the instigation of Metellus; but, this being detected, Bomilcar and most of his accomplices suffered death. The plot, however, had such an effect upon Jugurtha, that he enjoyed afterwards no tranquillity. He suspected persons of all denominations, Numidians as well as foreigners, of some black designs against him. Perpetual terrors sat brooding over his mind; he often changed his bed, and his sleep was disturbed by a spirit of fear, jealousy, and distraction. Jugurtha having destroyed great numbers of his friends, on suspicion of their having been concerned in the late conspiracy, and many more deserting to the Romans and Bocchus king of Mauritania, he found himself destitute of counsellors, generals, and all persons capable of assisting him in carrying on the war. This threw him into a deep melancholy, which rendered him dissatisfied with every thing, and made him fatigue his troops with a variety of contradictory motions. At last he was forced by Metellus to a battle. That part of the Numidian army which Jugurtha commanded behaved with resolution; but the other fled at the first onset. The Romans, therefore, entirely defeated them, took all their standards and made a few prisoners. A few were slain in the action, but the majority fled. Metellus pursued Jugurtha and his fugitives to Thala. His march, being through vast deserts, was extremely tedious and difficult. But being supplied with water by the natives, who submitted to him, Metellus advanced towards that city; when a copious shower of rain, a phenomenon in those deserts, proved a seasonable refreshment to his troops. This so animated them, that, upon their arrival before Thala, they attacked the town with such vigor, that Jugurtha with his family and treasures deposited therein, thought proper to abandon it. After a brave defence, it was reduced; the garrison, consisting of Roman deserters, setting fire to the king's palace, and consuming themselves with every thing valuable in the flames.

Jugurtha, being now reduced to great extremities, retired into Gætulia, where he formed a considerable corps. Thence he advanced to the confines of Mauritania, and engaged Bocchus king of that country, who had married his daughter, to enter into an alliance with him; in consequence of which, having reinforced his Gætulian troops with a powerful body of Mauritanians, he turned the tables upon Metellus, and obliged him to keep close within his intrenchments. Sallust informs us that Jugurtha bribed Bocchus's ministers to influence that prince in his favor; and that, having obtained an audience, he insinuated that, should Numi-

dia be subdued, Mauritania must be involved in its ruins, especially as the Romans seemed to have vowed the destruction of all the thrones in the universe. Bocchus was also determined to assist Jugurtha against his enemies, by the slight the Romans had formerly shown him. That prince, at the first breaking out of the war, had sent ambassadors to Rome, to propose an offensive and defensive alliance to the republic; which, though of the utmost consequence to it at that juncture, a few of the most venal and infamous senators prevented from taking effect. This undoubtedly wrought more powerfully upon Bocchus, in favor of Jugurtha, than the relation he stood in to him. Such was the situation of affairs when Metellus received advice of the promotion of Marius to the consulate. But, notwithstanding this injurious treatment, he generously endeavoured to draw off Bocchus from Jugurtha, though this would facilitate the reduction of Numidia for his rival. To this end ambassadors were despatched to the Mauritanian court, who intimated to Bocchus 'that it would be highly imprudent to come to a rupture with the Romans, and that he had now a fine opportunity of concluding a most advantageous treaty with them,' &c. To this Bocchus replied, 'That there was nothing he wished for more than peace, but that he could not help pitying the deplorable condition of Jugurtha; that if the Romans therefore would grant that prince the same terms they had offered him, he would bring about an accommodation.' Metellus let the Mauritanian monarch know, that it was not in his power to comply with what he desired. However he took care to keep up a private negotiation with him till Marius's arrival. By this conduct he served two ends: 1st he prevented Bocchus from coming to a general action with his troops, as Jugurtha wished; and 2dly, this inaction enabled him to discover something of the genius and disposition of the Moors; a nation of whom the Romans had scarcely formed any idea. Jugurtha, being informed that Marius with a numerous army was landed at Utica, advised Bocchus to retire, with part of the troops, to some place of difficult access, whilst he himself took post upon another inaccessible spot with the remaining corps. By this measure he hoped the Romans would be obliged to divide their forces, and thus be more exposed to his attacks. However he was disappointed; for Marius cut off great numbers of the Gætulian marauders, defeated many of Jugurtha's parties, and had almost taken that prince himself near Cirta. These advantages intimidated Bocchus, who now made overtures for an accommodation; but the Romans paid no attention to them. In the mean time Marius pushed on his conquests, reducing several places, and at last resolved to besiege Capsa. That this enterprise might be conducted with the greater secrecy, he suffered not the least hint of his design to transpire, not even among his officers. To blind them he detached A. Manlius, one of his lieutenants, with some light-armed cohorts, to the city of Lares, where he had fixed his principal magazine, and deposited the military chest. He then bent his march to-

wards the Tanaïs, and in six days arrived upon its banks, where he pitched his tents to refresh his troops; after which he advanced to Capsa, and made himself master of it. As the situation of this city rendered it extremely commodious to Jugurtha, whose operations during the war it had exceedingly favored, he delivered it up to the soldiers to be plundered and levelled with the ground. The citizens, being more strongly attached to that prince than any of the other Numidians, and of course bearing a more implacable hatred to the Romans, he put to the sword or sold for slaves. The Numidians, ever after this exploit, dreaded the very name of Marius; who had now eclipsed the glory of all his predecessor's great achievements, particularly the reduction of Thala, a city, in strength and situation, nearly resembling Capsa. Most of the places of strength in Numidia either opened their gates, or were abandoned at his approach, being terrified with what had happened to Capsa. Others, taken by storm, he laid in ashes; and, in short, filled Numidia with blood, horror, and confusion.

After an obstinate defence, he reduced a castle that seemed impregnable, seated near Mulucha, where Jugurtha kept part of his treasures. In the mean time Jugurtha, not being able to prevail upon Bocchus to advance into Numidia, was obliged to have recourse to his usual method of bribing the Mauritanian ministers. He also promised Bocchus a third part of his kingdom, provided they could either drive the Romans out of Africa, or get all the Numidian dominions confirmed to him by treaty. So considerable a cession prevailed on Bocchus to support Jugurtha with his whole power. The two African monarchs, having joined their forces, surprised Marius near Cirta as he was going into winter quarters. The Roman general was so pushed, on this occasion, that the barbarians thought themselves certain of victory; but their incaution enabled Marius to give them a defeat; which was followed four days after by so complete an overthrow that their numerous army, consisting of 90,000 men, was entirely routed. Sylla, Marius's lieutenant, most eminently distinguished himself in the last action, which laid the foundation of his greatness. Bocchus now looking upon Jugurtha's condition as desperate, and not being willing to run the risk of losing his dominions, showed a disposition to make peace with Rome. However, the Romans informed him that he could not be ranked amongst their friends, till he had delivered up Jugurtha, their inveterate enemy. Bocchus, having entertained a high idea of an alliance with Rome, resolved to secure it; and was confirmed in his resolution by Dabar, a Numidian prince, the son of Massugrada, and descended by his mother from Masinissa. Being closely attached to the Romans, he defeated all the intrigues of Aspar, Jugurtha's minister, and upon Sylla's arrival at the Mauritanian court, the affair there seemed to be entirely settled. However, Bocchus, who was in the highest degree perfidious, debated within himself whether he should sacrifice Sylla or Jugurtha, who were both then in his power. But at last he delivered up Jugurtha to Sylla, to be con-

deducted to Marius; who put him into a prison, where he died six days after of hunger.

The kingdom of Numidia was now reduced to a new form: Bocchus, for his important services, had the country of the Massæyli contiguous to Mauritania assigned him; which, from this time, took the name of New Mauritania. Numidia Propria, or the country of the Massyli, was divided into three parts; one of which was given to Hiempsal, another to Mandrestal, both descendants of Masinissa; and the third the Romans annexed to Africa Propria, or the Roman province adjacent to it. Jugurtha's two sons survived him, but spent their lives in captivity at Venusia. However, one of them, named Oxynthes, was released from his confinement by Aponius, who brought him to his army, where he treated him as a king, to draw the Numidian forces off from the Roman service. Accordingly those Numidians no sooner heard that the son of their king was fighting for the allies, than they began to desert by companies; which obliged Julius Cæsar to send all his Numidian cavalry back into Africa. A few years after this event, Pompey defeated Cneius Domitius Ahenobarbus, and Hiarbas one of the kings of Numidia, killing 17,000 of their men upon the spot; pursued the fugitives to their camp, which he soon forced, put Domitius to the sword, and took Hiarbas prisoner. He then reduced that part of Numidia which belonged to Hiarbas, who had succeeded Mandrestal, and gave it to Hiempsal, a Numidian prince, descended from Masinissa, who had always opposed the Marian faction. Suetonius informs us, that a dispute happening between Hiempsal and one Masintha, a noble Numidian, Cæsar warmly espoused the cause of Masintha, and grossly insulted Juba, Hiempsal's son, when he attempted to vindicate his father's conduct on this occasion. He pulled him by the beard, than which a more unpardonable affront could not be offered to an African. In short, he screened Masintha from the insults and violence of his enemies; which was the reason of Juba's adhering so closely afterwards to the Pompeian faction. In consequence of this indignity, Juba did Cæsar great damage in the civil wars betwixt him and Pompey. By a stratagem he drew Curio, one of his lieutenants, into a general action, which it was his interest to have avoided. He caused it to be given out, all over Africa Propria and Numidia, that he was retired into some remote country at a great distance from the Roman territories. This coming to Curio's ears, who was then besieging Utica, it prevented him from taking precautions against a surprise. Soon after, Curio hearing that a small body of Numidians was approaching his camp, he put himself at the head of his forces to attack them, and, lest they should escape, began his march in the night. Some of their advanced posts he found asleep, and cut them to pieces; which still farther animated him. In short, about day break, he came up with the Numidians, whom he attacked with great bravery, though his men were then fasting, and vastly fatigued by their forced march. In the mean time Juba, who had marched privately with the main body of his army, advanced to the relief of his men.

The Romans had met with great resistance before he appeared; so that he easily broke them, killed Curio, with a great part of his troops, upon the spot, pursued the rest to their camp, which he plundered, and took many of them prisoners. Most of the fugitives, who endeavoured to make their escape on board the ships in the port of Utica, were either slain by the pursuers or drowned. The remainder fell into the hands of Varus, who would have saved them; but Juba, who claimed the honor of the victory, ordered most of them to be put to the sword. This victory infused new vigor into the Pompeian faction, who conferred great honors upon Juba, and gave him the title of king of all Numidia. But Cæsar and his adherents declared him an enemy to Rome, adjudging to Bocchus and Bogud the sovereignty of his dominions. Juba, afterwards uniting his forces with those of Scipio, reduced Cæsar to great extremities, and would in all probability have totally ruined him, had he not been relieved by Publius Sittius. That general, having formed a considerable corps, consisting of Roman exiles, and Mauritanian troops sent him by Bocchus, according to Dio, or, as Cæsar has it, by Bogud, made an irruption into Gætulia and Numidia, whilst Juba was in Africa Propria. As he ravaged those countries in a dreadful manner, Juba immediately returned with the best part of his army, to preserve them from utter destruction. Cæsar, knowing his horse to be afraid of the enemy's elephants, did not attack Scipio in the absence of the Numidian, till his own elephants, and a fresh reinforcement of troops, arrived from Italy. In the mean time Scipio despatched reiterated expresses to Juba to hasten to his assistance; but could not prevail upon him to move out of Numidia, till he had promised him all the Roman dominions in Africa, on the expulsion of Cæsar. Upon this, having sent a large detachment against Sittius, he marched with the rest of his troops to assist Scipio. However, Cæsar overthrew Scipio, Juba, and Labienus, near the town of Thapsus, and forced all their camps. As Scipio was the first surprised and defeated, Juba fled into Numidia, without waiting for Cæsar's approach; but the Numidians sent against Sittius, having been dispersed by that general, none of his subjects there would receive him. He therefore, in despair, sought death in a single combat with Petreius, and, having killed him, caused himself to be despatched by one of his slaves. After this decisive action, and the reduction of Africa Propria, Cæsar made himself master of Numidia, which he reduced to a Roman province, appointing Crispus Sallustius to govern it in quality of proconsul, with private instructions to plunder the inhabitants, and thus put it out of their power to shake off the Roman yoke. However, Bocchus and Bogud still preserved a sort of sovereignty in the country of the Massæyli and Mauritania. The former, having deserted Cæsar, sent an army into Spain to assist the Pompeians; and the latter, with his forces, determined the victory in favor of Cæsar at the battle of Munda. Bogud, afterwards siding with Antony against Octavius, sent a body of forces to assist him in Spain; when, the Tingitanians revolting from

him, Bocchus with an army composed of Romans in the interest of Octavius, who passed over from Spain into Africa, and his own subjects, possessed himself of Mauritania Tingitana. Bogud fled to Antony; and Octavius, after the conclusion of the war, honored the inhabitants of Tingi with all the privileges of Roman citizens. He likewise confirmed Bocchus king of Mauritania Cæsariensis, or the country of the Massæyli, in the possession of Tingitania, which he had conquered, as a reward for his important services. In this he imitated the example of Julius

Cæsar, who divided some of the fruitful plains of Numidia among the soldiers of P. Sittius, who had conquered great part of that country; and appointed Sittius himself sovereign of that district. Sittius merited this reward, having taken Cirta, killed Sabura, Juba's general, entirely dispersed his forces, and either cut off or taken prisoners most of the Pompeian fugitives that escaped from the battle of Thapsus. After Bocchus's death, Mauritania and the Massæylian Numidia were in all respects considered as Roman provinces.

NUMISMATOLOGY.

NUMISMATOLOGY, from Greek *νομισμα* money, and *λογος* a discourse, is the name given to the science which treats of coins and medals, whether ancient or modern. The application of this term has, however, generally been confined to the consideration of coins rather as objects of historical or antiquarian research, than as media of commerce or tests of value; and the coinage, like the history of the passing day, is too universally understood to be a fit subject for study. As an auxiliary to history, numismatology certainly appears in its most important character, and affords documents too durable and too widely diffused to be utterly destroyed, and at the same time too valuable and too numerous to be easily falsified. Gold, the only metal on which the finger of time leaves no impression, was in ancient times comparatively common, and the coinage of the Roman emperors may be seen in the cabinets of the curious in as perfect a state as when first issued from the imperial mint. In modern times official papers and public records verify the statements of the historian; but in the earlier and more barbarous ages of the world such annals were seldom compiled, and when they were, in the wars and tumults of succeeding times, they were constantly liable to be destroyed. Before the introduction of printing but few copies of the most important records could be obtained, and an incursion of the enemy or an accidental conflagration would leave a people dependent for their history on tradition (attested by this art) alone. The more civilised nations, it is true, erected public buildings and monuments upon which they inscribed important transactions and occurrences; but these, few in number, were confined in their utility to the country where they were erected, and were not near so durable as the small gold medals commonly struck in honor of their erection.

Ancient writers frequently omit in the course of their narratives the dates of particular transactions, and, were it not for these metallic documents, we should often be at a loss to discover even the order in which they occurred. Vaillant in his learned history of the kings of Syria, published at Paris 1681, set the first important example of fixing the dates and arranging the order of events in ancient historians by means of these infallible vouchers. By them alone he was enabled to ascertain in a very great degree the chronology of important events in three of the most celebrated

kingdoms of the ancient world: viz. those of Egypt, Syria, and Parthia. In the Roman medals, in particular, we most commonly have, with the portrait of the prince and date of the consulship or tribunitian power, the representation or poetical symbol of some great event on the reverse. The reigns of Nerva and Trajan, for instance, are much better illustrated by coins than by historians; for Suetonius ends with Domitian, and the *Historiæ Augustæ Scriptores* begin with Hadrian. Capitolinus, in his life of Maximinus Junior, is in doubt whether Maximus and Pupienus were two emperors, or two names for the same emperor; had he met with one of the coins inscribed M. Cl. Pupienus Maximus Avg. he would have decided that Maximus was only another name for Pupienus. Medals also by supplying portraits of the great men of antiquity create in the mind a peculiar interest in their history, and we study their actions as in a theatre with the actors before us.—We see with delight the—

Black-eyed Cæsar, with
The eagle's beak between those eyes which ne'er
Beheld a conqueror or looked along
The land he made not Rome's;

and recognise, in the savage features of a Nero, the imperial matricide and incendiary.

But it is not to history alone that numismatology confines her assistance: the knowledge of ancient geography may be greatly increased by an attentive study of ancient medals. On many Greek coins the situation of the town where they were struck is inscribed, and particularly if near some noted river or mountain. Thus we have on a Magnesian coin ΜΑΓΝΗΤΩΝ ΣΙΠΥΛΑΟΥ proving Magnesia to be by mount Sipylus; and an Ephesian medal is inscribed ΕΦΕΣΙΩΝ, with ΚΑΙΣΤΡΟΣ on the exergue, showing Ephesus to have stood on the river Cayster. Many similar instances might be given on this head. The beautiful symbols on the Roman coins also merit the attention of the poet and the painter. Happiness is here represented (as on a gold coin of Severus) with heads of poppy, to express that large portion of our bliss which lies in the oblivion of misfortune; Hope is depicted as a young virgin walking quickly and looking intently forward; with her left hand holding up her garments that they may not impede her progress, and with her right presenting the bud of a

flower. Abundance is symbolised by a sedate matron with a cornucopia in her hands of which she scatters the fruit over the ground; not holding up the mouth of it as many painters make her do, as if to keep its contents entirely to herself. Security stands leaning on a pillar and the posture itself corresponds to her name. National prosperity is figured by a ship sailing before a favorable breeze; and the different countries of the then known world are delineated in all their interesting and striking peculiarities.

To a Briton it affords peculiar satisfaction to see his native island represented on imperial coins as a female sitting on a globe with the *labarum*, the symbol of power, in her hand, and the ocean rolling under her feet. Countries and rivers are also admirably personified on coins. On a colonial middle brass of rude execution, inscribed to Augustus and Agrippa, the conquest of Egypt is represented by the apposite symbol of the crocodile, esteemed at that period peculiar to that country, chained to a palm-tree, the emblem of triumph and a native symbol of Egypt. The emperor Titus having occasion to import a large supply of corn during a scarcity at Rome, that supply or *annona* is finely represented on one of his coins as a sedate matron, with a well filled cornucopia in her left hand, which she holds upright, to indicate that she cannot scatter it as Abundance may have right to do, but distributes it only as equity points out. This last particular is signified by her holding in her right hand a little image of justice, with her scales and *hasta pura* or pointless spear, over a basket filled with wheat. Behind the female figure is the prow of a ship decked with flowers, to imply that the corn was brought by sea (from Africa), and that the vessels had had a prosperous passage. No poet could present a finer train of imagery, no painter could convey more ideas in so small a compass.

The Roman medals likewise give us an excellent picture of the dress and arms of the times, and the shape of the toga may be as accurately learned from those of Hadrian as from any of the ancient statues. Their utility to natural history chiefly arises from the coins struck at the celebration of the secular games, on which the figures of various animals are preserved. On many of the Greek medals also lively representations of uncommon plants and animals may be seen: as the tortoise on the drachmas of *Egina*, the most ancient silver coin of Greece; and on most of the medals of Cyrene the celebrated plant called *sylphium*; as, on those of Tyre, the shell fish from which the famous Tyrian purple was procured. By means of medals also the exact delineations of many noble edifices are preserved, while not a vestige of their ruins even is in existence: so that the uses of them to the architect are very considerable. The skill displayed in the Greek sculpture has always been an object of admiration to the world, while their coins, equally worthy of attention, have been greatly neglected. Considered as mere works of art, they greatly excel those of Rome, even those of her best times; and the perfect beauty and tenderness of the female portraits, and the strength and expression of the male, are certainly

not exceeded by the larger efforts of the Grecian chisel. But in every respect the Roman coins are superior to those of the eastern nations, and, if any era were to be assigned as more eminent for workmanship than another, that from Augustus to Hadrian must have the preference.

SECT. I.—HISTORY OF NUMISMATOLOGY.

This study does not appear to be of an ancient date, and no mention is made of a medallic collection by classic writers. Suetonius, indeed, informs us that Augustus used on solemn occasions to present his friends with medals of foreign states and princes; and we know that individuals must have formed complete collections, for a complete set of silver coins was lately found in our own island containing all the emperors down to *Caracausius*, and similar collections have before been discovered in other parts of Europe. Such collections, however, were seldom made, as they were not esteemed valuable. A set of the coins indeed struck by the innumerable petty states using the Greek characters and language, could, at first, scarcely have been regarded as any acquisition; as they would have to a Greek the air of a domestic coinage, and be regarded with but little curiosity, however beautiful their impressions. Among the Romans, however, it was different. Banduri in his preface quotes *Ulpian* to show that certain coins were specially preserved among them, and it appears from the *Justinian* code that ancient gold and silver were used *pro gemmis*, for gems. From the decline of the empire the history of this science, with that of most others, is enveloped in darkness, till the revival of literature: or rather until the fall of *Constantinople* compelled the Greeks, the earliest children of science, to carry their learning into foreign lands.

Of modern authors, the first who attended systematically to the study of medals was *Petrarch*, who, being desired by the emperor *Charles IV.* to form a biography of illustrious men and place him on the list, with noble pride answered, that he would wait till the emperor's life and actions should deserve it. Taking occasion from this, he sent him a collection of medals in gold and silver with the following address:—*Ecce, Cæsar, quibus successisti. Ecce quos imitari studeas, et mirari: ad quorum formulam et imaginem te componas: quos præter te unum, daturus nulli homini sum, tua me movit auctoritas. Licet enim horum mores et nomina, horum ego res gestas novim, tuum est, non modum nosse, sed sequi: tibi itaque debentur.*—*Behold, Cæsar, whom thou hast succeeded. Behold whom you should study to imitate and admire, upon whose model and image you should mould yourself: these I should have given to no one but yourself, they were due to your situation of authority. I can only know the manners, names, and great deeds of these men; it is in thy power not only to know but to imitate them: and it is therefore thy duty.*

A collection of coins was made in the next century by *Alphonso* king of *Arragon*; but, although this monarch collected all that could be found throughout Italy, there could not have been very many, as the whole were contained in

an ivory cabinet, and carried always about with him. A very considerable collection was made by Anthony cardinal of St. Mark, nephew to Eugene IV., who was pope in 1431; and soon after the grand museum at Florence was begun by Cosmo de Medicis, where a collection of ancient coins and medals had a place among other curiosities. Matthias Corvinus, king of Hungary, about the same time, formed a noble collection of coins, along with ancient MSS. and other valuable relics of antiquity.

Mr. Pinkerton considers Agnolo Poliziano, or Angelus Politianus, as the first writer who adduced medals as vouchers of ancient orthography and customs. He cites different coins of the Medicean collection in his *Miscellanea*, written about 1490. By means of a cabinet of medals collected by Maximilian I. emperor of Germany, John Huttichius was enabled to publish a book of the lives of the emperors, enriched with their portraits, delineated from ancient coins. It is generally supposed that this book, which appeared in 1525, was the first work of the kind; but Labbe, in his *Bibliotheca Nummaria*, mentions another named *Illustrium Imagines*, by one Andrew Fulvius, printed in 1517, in which most of the portraits seem to be from medals. About 1512 also, William Bude, a French author, had written his treatise *De Asse*, though it was not printed till many years afterwards. M. Grollier, treasurer of the French armies in Italy, during part of the sixteenth century, had a great collection of coins in different kinds of metals. After his death his brass medals were sent to Provence, and were to have been sent into Italy; but the king of France, having received information of the transaction, gave orders to stop them, and purchased the whole at a very high price for his own cabinet of antiquities. M. Grollier had an assortment of gold and silver, as well as of brass medals: the cabinet in which they were contained fell two centuries afterwards into the hands of the abbé de Bothelin; and was known to have been that of Grollier, from some slips of paper, on which was his usual inscription for his books, *Johannis Grollerii et amicorum*.

Contemporary with Grollier was William de Choul, who was likewise a man of rank and fortune. He had a good collection of medals, and published many in his *Treatise on the Religion of the ancient Romans*, in 1557. In the Netherlands, we know, from the letters of Erasmus, that the study of medals was attended to about the beginning of the sixteenth century. About the middle of that century Hubert Goltzius, a printer and engraver, travelled over most countries in Europe, searching for coins and medals, to publish books concerning them. From one of these works it appears that there were then in the Netherlands 200 cabinets of medals; 175 in Germany; upwards of 380 in Italy; and 200 in France. But we are not to imagine that all these were grand collections; for of such there are not above a dozen even in Italy: most of those just mentioned were of the class named caskets of medals, containing from 100 to 1000 or 2000.

There are few countries, Italy excepted, in which a greater number of coins have been found

than in Britain; though we are by no means well acquainted with the time when the study of them commenced. Camden seems to have been one of the first British authors who published medals in his works, and probably had a small collection.

In the seventeenth century Sheed's Chronicle was illustrated with coins from Sir Robert Cotton's cabinet. Henry, prince of Wales, the eldest son of James I., bought the collection of Goriæus, amounting to 30,000 coins and medals, and left it to his brother Charles. Archbishop Laud bought a collection of 5500 coins, which he presented to the Bodleian library. Thomas, earl of Arundel and Surrey, earl marshal of England, had in his collection of antiquities a rich cabinet of medals, gathered by Daniel Nelsum. The dukes of Buckingham and Hamilton, Sir William Paston, Sir Thomas Fanshaw, Sir Thomas Hamner, Ralph Sheldon, Mr. Selden, and many more, are enumerated by Mr. Evelyn, as having collections. To this number we may add, the earl of Clarendon, the historian, and Charles I. The fine cabinet of this unhappy monarch was dissipated and lost in the civil commotions. Oliver Cromwell had also a small collection; and that of Charles II. is mentioned by Vaillant. Since the time of Mr. Evelyn many noble cabinets have been formed in this country, which our limits will not permit us to enumerate. The British Museum, lately enriched by some of those above mentioned, and the universities, have also collections; also the lawyers' library, and one or two colleges in Scotland; to which might be added private collections both there and in Ireland. But that of the late Dr. Hunter, bequeathed by him to the University of Glasgow, deserves notice, as one of the most considerable, if not the largest, in Europe. From the middle of the seventeenth century down to these times almost every year has produced some new work, or new discovery, in the science of medals.

Of writers on this science the following are the most worthy of notice:—Eneas Vico, who published in 1548 his *Discourses on the Coins and Seals of the Ancients*. His example was imitated in France by Antoine le Pois, who, in 1579, published a work on the medals of ancient Greece and Rome. In 1665 Charles Patin published his *History of Medals*, the last edition of which appeared in 1695. In 1692 Pere Jobert, or Joubert, presented to the public his *Science des Medailles*, the best edition of which is that of baron Bimard de la Bastie, 1759. Of those published by the father himself the first is undoubtedly the best; that of 1715, in 2 vols., being swelled only by the reveries of Pere Haradouin, whom Joubert wished to flatter. His own knowledge of coins was very limited, and he makes assertions at random without the slightest foundation. He asserts, for instance, that a sow on medals denotes Judea preserved by Vespasian, whereas it occurs on consular brass before the Romans had any connexion with Judea. In these it refers to the ancient method of ratifying treaties mentioned by Livy; as on the imperial coins it is meant to represent the sow with young found by Æneas the supposed founder of the Roman empire. Indeed, almost all the va-

hable notes of De la Bastie's edition are occupied with refutations of the errors of the author; so that what the reader imagines he has learned from the text, he finds, with perpetual chagrin, he has to unlearn in the notes. Had the baron given an entirely new work it would have been much more valuable. In the year in which Joubert published his treatise a work somewhat similar appeared in the English language, entitled *The Greek and Roman History illustrated by Medals and Coins* representing their religion, rites, &c., by O. W. (Obadiah Walker), London, 1692. In 1695 a translation of Joubert's work appeared, under the title of *The Knowledge of Medals*, also ascribed to Walker. The *Nomismata*, or *Discourse on Medals*, ancient and modern, by Mr. Evelyn, was printed in 1697, fol. but most of his observations are taken from Joubert, Vico, Le Pois, or Patin. In 1720 Nicolas Haym, an Italian musician, published in London his *Tesoro Britannico*, or *British Treasury*, in Italian and English. If but a letter appears on a coin, says Mr. Pinkerton, Haym can tell to what name that letter belongs; if but a nose, he will find a face to it; and, even if the coin is quite bare, to divine its ancient form costs him but a moment's thought. With the help of Diogenes Laertius he would find all the sages of Greece on old coins. He pretends to mark the rarity of several series of coins, but his statements cannot be relied on.

We have, in modern times, no work in which the writer has fully availed himself of the excellent public and private collections of this country: such a work is a desideratum which we hope to see shortly supplied; in the interim, those who wish to study this interesting science at greater length cannot do better than procure Mr. Pinkerton's *Essay on Medals*, 2 vols. 8vo.; after which they may turn to Frœlich's *Notitia Numismatum Urbium Liberum, Regum et Principum ac personarum illustrium*; to Vico's work already mentioned; and to Patin. The study of the Greek coins may be commenced with the *Historia Siciliæ Græciæ ex antiquis Numismatibus*, fol. of Goltzius, published at Antwerp in 1644. Gesner's *Thesaurus Numismatum*, Tiguri 1738, 2 vols. fol. may then follow. Dr. Combe's work on Dr. Hunter's Coins of Greek Cities, London, 1782, 4to., is one of the best of the kind; and of the Greek monarchic coins Gesner's will be found the most ample collection. The Roman consular coins are also fully described by Gesner; and descriptions may be found in Vaillant's *Nummi Antiqui Familiarum Romanorum*, Amsterdam, 1703, 2 vols. fol., or the *Thesaurus Morellianus*, Amsterdam, 1734, 2 vols. fol., a later and still better work. Gesner may also be referred to for the Roman imperial coins, with whom, for the rare coins, should be read Vaillant's *Numismata Imperatorum Romanorum*, published by Baldini at Rome, 1743, 3 vols. 4to.; Khell's *Numismata Imperatorum Romanorum*, Vindobonæ, 1767, 4to.; Banduri's *Numismata Imperatorum Romanorum*, a Trajano Decio usque ad Palæologos, Lutetie, 1718, 2 vols. fol.; and Occo's *Numismata Imperatorum Romanorum*, of which the best edition is the second of Occo himself.

We shall add in this place a brief account of the most celebrated public numismatical collections in Europe, of which that belonging to the king of France is by far the largest and most complete. The considerable treasures formerly collected by Boze, the marshal d'Etrées, Seguin, Patin, and in more modern times by Pellerin, are all incorporated with that valuable collection. Its basis was formed by Louis I. at Fontainebleau; Henry II., Louis XIII., and particularly Louis XIV. increased its treasures with royal munificence; and the last of the just mentioned monarchs caused the large medals of this cabinet to be engraved by de la Bossière. Besides the above mentioned collections, this cabinet acquired, in 1793, the Cabinet de St. Geneviève at Paris. An idea of the value of the present collection may be formed by the valuation made of it above half a century ago, which amounted to no less than 6,000,000 of livres. The Cabinet of St. Geneviève, which, having been threatened by robbers in 1793, was removed to the national library, and incorporated with the great collection, has been described by Claude du Molinet in 1692. The *Hunterian collection*, now in the possession of the university of Glasgow, is one of the most celebrated in Europe. The foundation of this collection was laid in the year 1770, from those of the Rev. Mr. Dawes and Thomas Sadler, Esq. The next year added much to the stock from various cabinets, particularly that of Isaac Jamineau, his majesty's consul at Naples. Mr. Sainthill, surgeon, in 1772; the prince of Peralta, and Mr. West, in 1773, continued to enrich Dr. Hunter's cabinet. In 1776 the Egyptian coins were much increased from the collections of Mr. Bruce and Lindegreene a Swede, who had resided in Egypt. Mr. Dorana added his collection to Dr. Hunter's in the same year, and it contained the accumulated treasures of many eminent scholars and antiquarians. At the same time Mr. White supplied, from his museum, those coins which were wanting in Dr. Hunter's; and, as if this year was to be distinguished by the value of the acquisitions and the characters of the benefactors, Dr. Russel supplied those deficiencies which his ample collection enabled him to discover. The year 1777 furnished still additional stores from Dr. Combe, a foreign nobleman, Mr. Swinton, Mr. I. Smith, the Rev. Dr. Eyre, and Mr. Samuel of Lincoln, and from numerous other benefactors. In the year 1782 Dr. Combe published his *Nummorum Veterum Populorum et Urbium qui in Museo Gulielmi Hunter Asservantur Descriptio*; a highly useful work, in which the Greek and Roman coins are arranged according to the different cities in which they were struck.

The very rich collection of coins and medals in the British Museum was formed from the cabinets of Sir Hans Sloane and Sir Robert Cotton, and has been from time to time enlarged by many valuable purchases and donations, but principally by the munificent bequest of the Rev. C. M. Cracherode. It is comprehended under the three following heads:—1. Ancient coins; 2. Modern coins; 3. Medals. The first of these heads consists of Greek and Roman coins. The Greek coins are arranged in geographical order,

and include all those which are struck with Greek characters, in Greece, or elsewhere, by kings, states, or cities, which were independent of the Romans. With this class are placed, likewise, the coins of free states and cities, which made use of either the Etruscan, Roman, Punic, Spanish, or other characters. The Roman coins are placed, as far as it can be ascertained, in chronological order. They consist of the As in its divisions; family or consular coins; imperial coins struck in Rome; imperial coins struck in Egypt; imperial coins struck in the Roman colonies; imperial coins struck with Punic characters; contorniates. The second head, comprising modern coins, consists of Anglo-Saxon, English, Anglo-Gallic, Scotch, and Irish coins, and likewise the coins of foreign nations. This class is arranged according to the respective countries to which the coins belong, those of each country being kept separate.

The third head, which comprises a class considerably more modern than either of those which precede it, consists of medals struck in our own country, and of those which have been struck abroad. These are arranged in the same manner as the modern coins. The celebrated imperial collection of coins at Vienna, if we except that of Paris, stands unrivalled among the cabinets of the continent. It was begun by the emperor Ferdinand I., and soon considerably increased by the accession of other collections, such as that formed by the archduke Albert, under the direction of the Chiffets; and the most valuable collection formed by the archduke Ferdinand at Ombras in Tyrol. It was afterwards considerably added to by the collections of the learned monarchs Maximilian I. and Rudolph II.; but particularly by the zeal of the emperor Charles VI., who was himself a great lover of numismatology, and who purchased the cabinets of the Carthusians at Rome, together with that of count Parr.. In the reign of Maria Theresa it was farther increased by the purchase of the Granelli collection. Several years ago the number of coins and medals of this collection amounted to upwards of 40,000, of which about 22,000 were antique. We possess a masterly catalogue of the Vienna collection by the celebrated Joseph Eckhel, published as early as 1779, and therefore far from giving a correct idea of the present state of that highly valuable repository.

The Prussian cabinet of medals is considered the greatest in Germany, next to the Imperial collection of Vienna. The celebrated Laurent Beger published a catalogue of this collection, in 3 vols. folio, entitled *Thesaurus Brandenburgicus Selectus, Coloniae Marchicae*, 1696, 1699, and 1701. Though king Frederick William I. took out a number of large gold coins (among which was the very large one, eight pounds, or 500 ducats in weight, bearing the portraits of Frederic William the Great, and his queen), which were converted into small current money, yet the collection is still richly furnished: the number of its antique treasures having been increased by 6000 coins from the cabinet of the late margrave of Anspach.

Next in importance among the numismatological collections of Germany is that of Gotha, the

basis of which was formed by Ernest the Pious. It was materially increased by the excellent Arnstadt cabinet of medals, which was formed by Antony Gunther, prince of Schwarzburg, assisted by several celebrated antiquaries and historians, such as Andreas Morellus, Christian Schlegel, Olearius, &c. This latter collection was purchased, in 1713, by John Frederick, duke of Saxe-Gotha, for the sum of 100,000 dollars. It is preserved in small cabinets, each of which is placed on a table, furnished below with a shelf for books relative to the coins above. This celebrated collection has been at different times considerably increased by others, such as those of Schachman and Sultzer, that of Mr. Gerning, rich in scarce Greek coins, that of baron Seckendorf, &c. The coins in the Gotha collection are still arranged after the old way, by the sizes and metals, and the same mode is adopted in the catalogue, seven volumes of which comprise the antique coins as follows: gold coins, kings; coins of cities and free states; coins of families; imperial silver; coins of first size; coins of second and third size.

SECT. II.—MANUFACTURE OF ANCIENT COINS AND MEDALS, WITH A GENERAL DESCRIPTION OF THEM.

The ancient methods of coining appear, from the coins themselves, and from the instruments sometimes represented on their reverses, to have been extremely simple. Of the Grecian mint we know comparatively nothing; but from the extreme beauty of the workmanship of its coins, and the purity of metal they exhibit, we may conclude that no small share of attention was devoted to their manufacture. Among the Romans we know the mint was regarded as one of the most important offices of the state, and was therefore placed under the direction of the questor, who also had the control of the treasury. About B. C. 266, when silver was first coined in Rome, the triumviri monetales appear to have been first appointed, and their office continued till the time of Caracalla. They were originally chosen from the senatorial order, but in the time of Augustus they were taken also from the equestrian, and we find them noticed on one of the coins of that emperor as III VIR. A. A. A. F. F. *Triumviri, Auro, Argentio, Cere, Flando, Feriundo*, triumviri, for melting and striking gold silver and brass. Under Aurelian there appears to have been but one master of the mint, called the rationalis, who was soon after styled procurator monetæ. In the colonies the direction of the coinage appears to have been entrusted to duumviri, whose names often occur in colonial pieces, and who were chosen annually like the consuls at Rome. The other officers of the Roman mints were the assayers, *spectatores*, or *nummularii*; the engravers of the die, *celatores*; the refiners, *cenarii*; the melters, *fusarii*, or *staturarii*; the equatores monetarum, who adjusted the weight; the suppostores, who placed the pieces in the die; and the malleatores, who struck it. A prunicerius was at the head of each office, and there was a kind of foreman called *optio et exactor*.

Gold and silver in their unmixed state were

early found too flexible and soft for general use, and hence arose the necessity of mixing with them a certain quantity of harder metal as alloy. The quantity or proportion of this alloy is various in different ages and countries. The most ancient gold coins existing, those of Lydia and other states in Asia Minor, are not of the purest gold, many not being above twenty carats fine. Many of the earliest coins seem to be formed of the metal anciently called electrum, and consisting of gold and silver. But when Philip, the father of Alexander the Great, coined the first Grecian gold, procured from the mines of Philippi, the art of refining gold had attained great perfection, and his coins are of the utmost purity. They are rivalled, however, by those of his son Alexander, and of other princes and cities within a few centuries of that age. The gold coins of the Egyptian Ptolemies are twenty-three carats three grains fine, with one grain alloy. The Roman gold coinage is very pure from the earliest times, and remained in this state till the reign of Severus. Most of the Roman gold was from Dalmatia and Dacia, where this metal is still found. Pliny says that the gold was refined by mercury, which mingled with it but rejected alloy, and the gold was afterwards delivered from the mercury by squeezing it in skins, when the mercury ran through and left behind the gold pure. In his time, indeed, the gold coins were very fine; and Boden tells us, that the goldsmiths of Paris, upon melting one of Vespasian's gold coins, found only $\frac{1}{16}$ part of alloy.

Most of the ancient silver, particularly that of Greece, is less pure than that of succeeding times; even the Roman silver is rather inferior to the present standard; but, in the time of Severus, the silver appears very bad, and continues so until the time of Dioclesian. Many writers upon this subject have mistaken the *denarii ærei*, 'coins of brass washed with silver,' for silver currency. Silver coins are extremely scarce from the time of Claudius II. to that of Dioclesian, or from A.D. 270 to 284; in which short space no fewer than eight emperors reigned. Silver at that time was found mostly in Spain; and such were the troubles of the times, that both the silver and gold coins of those eight emperors are extremely scarce. There is still, however, some silver extant of these eight emperors. Occasional deprivations of silver had taken place long before; as Pliny tells us that Mark Antony mixed iron with his silver *denarii*; and Mr. Pinkerton informs us that he had seen a *denarius* of Antony which was attracted by a magnet.

The ancient brass coins are of two kinds: the red or Cyprian, which indeed is no other than copper; and the common yellow brass. In the Roman coinage brass was double the value of copper; and it was probably the same among the Greeks: the latter is the metal most commonly made use of in the Greek coinage. The Roman *sestertii* are always of brass; the middle-sized kind are partly copper and partly brass; the former being double the value of the latter, which are the asses. As the medals of these metals are always covered with platina the difference has not excited attention.

Of the mixed metals beside electrum the most valuable was the Corinthian brass, which however does not appear to have been used at all in the fabrication of medals. Besides the authority of Pliny and other antiquaries of more modern date, who all declare that they never saw a single medal of Corinthian brass, or of that metal mixed with silver and gold, Mr. Pinkerton adduces other evidence which he looks upon to be superior to either, viz. that those who have advanced this opinion imagine that the large pieces called *sestertii*, and others called *dupondiarii*, worth about two-pence or a penny, are said to have been composed of this precious metal. It is unreasonable to think that any proportion of gold or silver could have been made use of in these. The coins said to have been struck upon Corinthian brass are only done upon a modification of common brass; of which we know, that, in proportion to the quantity of zinc made use of in conjunction with the copper, the metal assumes a variety of hues. Pliny says that the coins mistaken for Corinthian brass were no other than prince's metal.

The Egyptian silver coins struck under the Roman emperors are at first of tolerably pure silver; but afterwards degenerate into a mixture of copper and tin with a little silver, styled by the French *potin*. They are very thick, but many of them are elegantly struck, with uncommon reverses. There are likewise three sets of brass coins belonging to this country from the earliest times of the Roman emperors there. Some of these are of bell-metal or pot-metal; and after the time of Gallienus and Valerian, the coinage of brass with a small addition of silver became authorised by the state; the coins struck upon it being called *denarii ærei*. Those of lead or copper plated with silver have been fabricated by Roman forgers. Some coins of lead, however, have been met with of undoubted antiquity: and an ancient writer informs us that tin money was coined by Dionysius; but none has been found. The lead coins of Tigranes, king of Armenia, mentioned as genuine by Jobert, are accounted forgeries by modern medallists. Plautus, however, makes mention of leaden coins, and several of them have been found; but they are generally thought to have been chiefly essay pieces, struck in order to let the artist judge of the progress of the die. Others are the plated kind already mentioned, fabricated by ancient forgers, but having the plating worn off. A great number of leaden coins are mentioned by Ficorini in a work entitled *Piombi Antichi*, in which he supposes them to have served as tickets for guests; and coins of the same kind are also mentioned by Passeri.

Whatever the metal of which the coins were composed, the Roman moneyers cast it into a round bullet, in order to assist the high relief, as appears from the ancient coins not being cut or filed at the edges, but often cracked; and always rough and unequal. In modern coinage the blank pieces are flat, and cut round by the stroke of a machine, a plan followed even in the seventh and eighth century; but the hammered coin of the ancients appears never to have been cut. The bullets were put into the die, and

received the impression by repeated strokes of the hammer, though sometimes a machine appears to have been used for this purpose: for Boiterue informs us that there was a picture of the Roman mintage, in a grotto near Baia, where a machine was represented holding up a large stone, as if to let it fall suddenly, and strike the coin at once. None of the ancient money was cast in moulds, excepting the most ancient and very large Roman brass, commonly called weights, and other Italian pieces of that sort; all the rest being mere forgeries of ancient and modern times. Some Roman moulds which have been found are a proof of this; and from these some medallists have erroneously imagined that the ancients first cast their money in moulds, and then stamped it, in order to make the impression more clear and sharp.

The ancients had some knowledge of crenating the edges of their coins, which they did by cutting out regular notches upon them; and of this kind we find some of the Syrian and ancient consular coins, with a few others. The former were cast in this shape and then struck; but the latter were crenated by incision, to prevent forgery, by showing the inside of the metal: however, the ancient forgers also found out a method of imitating this; for Mr. Pinkerton informs us that he had a Roman consular coin of which the incisions, like the rest, were plated with silver over the copper.

As most medals and coins have a portrait on one side, that side is called the face or obverse, the opposite the reverse. The field is the interior space, which is enclosed nearly all round by the rim, except the bottom part, called the exergue, which is commonly separated from the field by a line upon which the figures of the reverse stand. Most medals contain, besides the portrait and other figures, also letters or words illustrative of some circumstance concerning them. If these letters or words occupy the field, they are denominated inscriptions; but if they run round the margin, or upon either side of the figures, or upon the exergue, they are more properly denominated legends.

In large cabinets medals are generally chronologically arranged under the separate heads of gold, large and small; silver, large and small; and brass, large, middle, and small; which are not so much distinguished by the breadth or thickness of the medal itself, as by the size of the head stamped upon it. But beside the ordinary coins of the ancients, which passed in common circulation, there were others of a larger size, which are now termed medallions. These were struck on the commencement of the reign of a new emperor, and other solemn occasions; frequently also, by the Greeks in particular, as monuments of gratitude or of flattery. Sometimes they were mere trial or pattern pieces; and those about after the time of Maximilian, with the words *Tres Monete* on the reverse. The common opinion is, that all the Roman pieces of gold exceeding the *denarius aureus*, and all in brass exceeding the *sestertius*, went under the denomination of medallions; but many of these large pieces went in circulation, though not very commonly. The finest medallions

were presented by the mint-masters to the emperor, and by the emperor to his friends, as specimens of workmanship. The best we have at present are of brass, and many of them composed of two sorts of metal; the centre being copper, with a ring of brass around it, or the contrary; and the inscription is sometimes confined to one of the metals, sometimes not. There is a remarkable difference between the Greek and Roman medallions in point of thickness; the latter being frequently three or four lines thick, while the other seldom exceed one. Very few medallions, however, were struck by the Greeks before the time of the Roman emperors; but the Greek medallions of the emperors are more numerous than those of the Romans themselves.

All these pieces, however, are of such high prices, that few private persons are able to purchase them. In the seventeenth century, Christina, queen of Sweden, procured about 300. In the king of France's collection there have been reckoned 1200, a number formerly supposed not to exist; but Dr. Hunter's collection contains about 100, exclusive of the Egyptian.

Besides these large pieces, there are smaller ones of a size somewhat larger than our half-crowns; and by Italian medallists are called *medaglioncini*, or small medallions. They are still scarcer than the large kind.

There is still a third kind, which have almost escaped the notice of medallists, viz. the small coins or *missilia* scattered among the people on solemn occasions; such as those struck for the slaves on account of the *Saturnalia*; counters for gaming; tickets for baths and feasts; tokens in copper and in lead, &c. Many, or perhaps almost all, of those struck for the *Saturnalia* were satirical; as the slaves had then a license to ridicule not only their masters, but any person. One of the most common pieces of this kind has on the obverse the head of an old woman veiled, with a laurel crown; the reverse only s. c. within a wreath.

A fourth class of medals are called *contorniat*, from the Italian *contorniato*, encircled, because of the hollow circle which commonly runs around them. They are distinguished from medallions by their thinness, faint relief, reverses sometimes in relief, sometimes hollow, and in general by the inferiority in their workmanship. The opinions of medallists concerning these pieces are very various: some suppose them to have been struck by Gallienus to the memory of illustrious men and celebrated athletes, at the time that he caused all the consecration coins of his predecessors to be restored; others ascribe their invention to Greece, &c.; but Mr. Pinkerton is of opinion that they were only tickets for places at public games. Many of them, notwithstanding their inferior workmanship, are very valuable, on account of their preserving the portraits of some illustrious authors of antiquity no where else to be found, though some think much dependence cannot be put on them. They, however, are valuable, as being ancient, and perhaps traditional portraits of these great men.

The usage of coining money for the imme-

date of a blockaded town is very ancient.

The medals thus struck are called obsidional, and generally bear in their fabrication and material evidences of the calamitous and bereaved condition which gave rise to their existence. They are mostly of bad metal, and rudely formed, an observation to which some exceptions of course occur, but they are not numerous. The shape of these coins or medals varies:—sometimes they are round, sometimes oval, sometimes square; occasionally, even, octagon or triangular, &c. The type and inscriptions vary equally. Some are engraved on both sides, which however is rare; by far the greater part having no reverse. It is more common to see the name of the town only (either entire or abridged) with the date and value.

Their different thickness forms a remarkable distinction between the Greek and Roman medallions; the Roman being often three or four lines thick, while the others seldom exceed one. By the Greek medallions we mean those struck in the imperial periods; for few Greek medallions are found prior to the emperors of Rome. But there is a fine one struck at Syracuse, upon the defeat of Ictas by Timoleon. The medallion is of silver, with the head of Ceres upon one side, and upon the other a female figure, perhaps representing Sicily or Syracuse, in a car, a victory crowning her, and spoils in the exergue. Its workmanship is fine, but not equal to that of the gold coin of the same Ictas, struck at Syracuse, ΕΙΛΗ ΙΝΕΤΑ, under Ictas, which is a perfect gem surpassing all description. Syracuse also affords a most remarkable medallion on another great occasion. The only one perhaps existing formerly belonged to Dr. Combe, and was engraved by his order. It is exquisitely wrought, in high relief, and perfect preservation; of copper, and about two inches in diameter. Upon one side is a female head, covered with a helmet, on which is a caduceus and roma. Upon the other is a man's head, with a helmet wreathed with laurel, and M. M. Dr. Combe thinks this fine piece, now in Dr. Hunter's cabinet, was struck by Syracuse, in honor of Marcus Claudius Marcellus, who besieged and took that city, 210 years B. C. This medallion is most remarkable for its being unique; for its beauty, for its preservation, and for the portrait of this great man. These are perhaps the only Greek medallions prior to the Roman empire.

As for the ornaments of portraits, the chief is the diadem, or vitta, a ribbon worn about the head, and tied in a floating knot behind, the ancient simple badge of kingly power. It is observable upon the Greek monarchic medals, from the earliest ages to the last; and is almost an infallible sign of the portrait of a prince. In the Roman coins it is seen on the consular one with Numa and Ancus; but never after till the time of Licinius.

The Romans had such an abhorrence of this badge of kingly distinction, that their emperors had, for two centuries, wore the radiated crown, peculiar to the gods, before they dared to assume this tyrannic badge. However, in the family of Constantine, the diadem became common, but divested of its ancient simplicity; be-

ing ornamented on either side with a row of pearls, and various other decorations. The radiated crown, at first, as in the posthumous coins of Augustus, a mark of deification, was, in little more than a century after, put upon most of the emperors' heads in their several medals. The crown of laurel, at first the honorary prize of conquerors, was afterwards commonly worn, at least in their medals, by all the Roman emperors from Julius, who was permitted by the senate to wear it always, in order to hide the baldness of his forehead. In the lower empire, the laurel is often held by a hand above the head, as a mark of piety. Agrippa appears on his coins with the rostral crown, a sign of naval victory or command, being made of gold, in resemblance of prows of ships tied together. He is likewise seen with the mural or turreted crown, the prize of first ascending the walls of an enemy's city. The oaken, or civic crown, is frequent on reverses, as of Galba and others; and was the badge of having saved the life of a fellow citizen, or of many citizens. See CROWN. Besides the diadem, the Greek princes sometimes appear with the laurel crown. The Arsacids, or kings of Parthia, wear a kind of sash round the head, with their hair in rows of curls like a wig. Tigranes, and the kings of Armenia, wear the tiara. Xerxes, a petty prince of Armenia, appears on a coin in a conic cap, with a diadem around it. Juba, the father, has a singular crown, like a conic cap, all hung with pearls.

The successors of Alexander assumed different symbols of deity on the busts of their medals; such as the lion's skin of Hercules, surrounding the head of the first Seleucus; the horn placed behind the ear, an image of their strength and power, or of their being the successors of Alexander, called the son of Jupiter Ammon; the wing, placed in like manner behind the ear, symbolic of the rapidity of their conquests, or of their descent from the god Mercury, &c. Pyrrhus, as Plutarch informs us, had a crest of goat's horns to his helmet; and the goat was a symbol of Macedon. The successors of Alexander might take this badge on that account. The helmet also appears on coins, as in those of Macedon, under the Romans, which have Alexander's head, sometimes covered with a helmet. Probus has the helmet: and Constantine I. has helmets of different forms, curiously ornamented.

The Greek queens have the vitta or diadem. Most queens of Egypt have the sceptre. The Roman empresses never appear with the diadem, the variety of their head-dresses compensating the want of it. The remarkable part of the Roman head-dress among the ladies was the sphendon, or sling, on the crown of the head, which was of gold, and so prominent as to be even remarkable on a coin. Sometimes the bust of an empress is supported by a crescent, denoting that she was the moon, as her husband was the sun of the state. There are other symbolic ornaments of the head observable on some Roman coins. Such is the veil, or rather toga, drawn over the head, and seen on the busts of Julius Cæsar, when Pontifex Maximus, and others. Latterly the veil was only a mark of consecration, and is common on coins of em-

presses, as *Faustina* and others. In the coins of *Claudius Gothicus* it is first found as a mark of the consecration of an emperor; and it was continued in those of *Constantius I.*, *Maximian I.*, and *Constantine I.* 'These coins,' says Mr. *Pirkerton*, 'rank with those that are valuable for their rarity.'

The nimbus, or glory, now peculiar to the saints, was formerly applied to emperors. A nimbus appears round the head of *Constantine II.*, in a gold coin of that prince, and of *Flavia Maxima Faustina*, in a gold medallion; and of *Justinian* in another. But the idea is as ancient as the reign of *Augustus*. *Havercamp* gives a singular coin, which has upon the reverse of the common piece with the head of *Rome*, *URBS ROMA*, in large brass. *Constantine I.*, sitting amid victories and genii, with a triple crown upon his head, for *Europe*, *Asia*, and *Africa*: legend *SECURITAS ROMÆ*. The bust alone is generally given on ancient coins; but sometimes half the body, or more; in which latter case the hands often appear, with tokens of majesty in them. Such is the globe, said to have been introduced by *Augustus*, to express possession of the world; the sceptre, sometimes confounded with the consular staff; the roll of parchment, symbolic of legislative power; and the handkerchief, expressing that of the public games, where the emperor gave the signal. Some princes hold the thunderbolt, showing that their power on earth was equal to that of *Jupiter* in heaven. Others hold an image of victory.

The reverses of medals contain figures of deities at whole length, with their attributes and symbols; public buildings and diversions; allegorical representations; ceremonies civil and religious; historical and private events; figures of ancient statues; plants, animals, and other subjects of natural history: ancient magistracies, with their insignia; and, in short, almost every object of nature or art. Some reverses bear the portrait of the queen, the son, or the daughter of the prince who appears on the obverse. Such are highly esteemed by antiquaries, not merely because coins stamped with portraits on both sides are valuable, but because they identify the personage on the reverse to have been the wife, the son, or the daughter, of such a particular prince, and thus help in the adjustment of a series. Some medals with two portraits are very common; such are *Augustus* reverse of *Caligula*, and *M. Aurelius* reverse of *Antoninus Pius*. The reverses of the Roman coins have more of art and design than the Greek; but the Greek have more exquisite relief and workmanship than the other. In the very ancient coins no reverse is found except a rude mark struck into the metal, as of an instrument with four blunt points, on which the coin was struck. Afterwards, by degrees, we see some little image of a dolphin, or other animal, inserted into one of the departments of the rude mark, or into a hollow square. Then follows a perfect reverse of a horse, or the like, with a slight mark, and at length without any mark, of the hollow square. Some ancient Greek reverses are struck in intaglio, not in cameo; hollow, not

relief. Such are those of *Caulonia*, *Crotone*, *Metapontum*, and some other ancient cities of *Græcia Magna*. These reverses sometimes bear the same type in intaglio which the obverse has in cameo; and sometimes they are quite different. When complete reverses appear on the Greek coins, about 500 years B.C., they are of exquisite relief, minute finish, and beauty. The very muscles of men and animals are seen, and will bear inspection with the largest magnifier, as ancient gems.

Of Roman coins the reverses are very uniform, the prow of a ship, a car, or the like, till about 100 years B.C., when various reverses appear on their consular coins in all metals. The variety and beauty of the Roman imperial reverses are well known. The medallist much values those which have a number of figures, as the *Puella Faustinae* of *Faustina*, a gold coin no larger than a sixpence, which has twelve figures: that of *Trajan*, '*Regna adsignata*,' which has four: the '*Congiarium*' of *Nerva*, with five: the '*Alloccutum*' of *Trajan* with seven; of *Hadrian*, with ten; of *Probus*, with twelve. Some Roman medals, to which no peculiar name has been appropriated by medallists, have small figures on both sides, as the '*Apolloni Sancto*' of *Julian II.* Others have only a reverse, as the noted '*Spintriat*,' which have numerals *I. II. &c.* on the obverse.

The figures of deities and personifications on the Roman coins are commonly attended with their names, besides being distinguished with their attributes. These names, without an adjunct, are put down merely because it was necessary that the coin should have a legend. Thus, in a coin of *Lucilla*, *Venus*, though well known by the apple which she always holds in her hand, has nevertheless the name round her, *Venus*, without any addition. But an adjunct is most commonly added, and this renders the insertion of the name very proper and necessary, as in the instance of a *Neptune*, with *Neptuno reduci*:—a *Venus*, with *Veneri victrici*, and others similar. The like may be said of the coins with a figure of modesty, *pudicitia Augustæ*; of virtue, *virtus Augusti*, &c.; for it is the legend which appropriates the virtue to the emperor or empress, and thus leaves no doubt as to the meaning of the reverse.

In the Greek coins a superior delicacy is observed by not expressing the name of the deity, but leaving it to the easy interpretation of fixed symbols.

The principal symbols of the divine attributes to be met with on the Greek medals are as follow:—

1. *Jupiter* is known on the coins of *Alexander the Great* by his eagle and thunderbolts: but, when the figure occurs only on the obverses of coins, he is distinguished by a laurel crown, and placid bearded countenance. *Jupiter Ammon* is known by the ram's horn twisting round his ear; a symbol of power and strength assumed by some of the successors of *Alexander the Great*, particularly by *Lysimachus*.

2. *Neptune* is known by his trident, dolphin, or being drawn by sea-horses; but he is seldom met with on the Grecian coins.

3. Apollo is distinguished by a harp, branch of laurel, or tripod; and sometimes by a bow and arrows. In the character of the sun his head is surrounded with rays; but, when the bust only occurs, he has a fair young face, and is crowned with laurel. He is frequent on the coins of the Syrian princes.

4. Mars is distinguished by his armour, and sometimes by a trophy on his shoulders. His head is armed with a helmet, and has a ferocious countenance.

5. Mercury is represented as a youth, with a small cap on his head, wings behind his ears, and on his feet. He is known by the cap, which resembles a small hat; and the wings. He appears also with the caduceus, or wand, twined with serpents, and the marsupium, or purse, which he holds in his hand.

6. Æsculapius is known by his bushy beard, and his leaning on a club with a serpent twisted round it. He sometimes occurs with his wife Hygeia or Health, with their son Telesphorus or Convalescence between them.

7. Bacchus is known by his crown of ivy or vine, his diadem and horn, with a tiger and satyrs around him.

8. The figure of Hercules is common on the coins of Alexander the Great, and has frequently been mistaken for that of the prince himself. He appears sometimes as a youth, and sometimes with a beard. He is known by the club, lion's skin, and remarkable apparent strength; sometimes he has a cup in his hand; and a poplar tree, as a symbol of vigor, is sometimes added to the portrait.

9. The Egyptian Serapis is known by his bushy beard, and a measure upon his head.

10. Apis is delineated in the form of a bull, with a flower of the lotos, the water lily of the Nile, supposed by Macrobius to be a symbol of creation; and Jamblicus tells us that Osiris was thought to have his throne in it.

11. Harpocrates, the god of silence, appears with his finger on his mouth; sometimes with the sistrum in his left hand; a symbol common to most of the Egyptian deities.

12. Canopus, another Egyptian deity, appears in the shape of a human head placed on a kind of pitcher. See CANOPUS.

13. The Holy Senate and Holy People appear frequently on Greek imperial coins, sometimes represented as old men with beards, on others as youths.

The goddesses represented on medals are,

1. Juno, represented by a beautiful young woman, sometimes with a diadem, sometimes without any badge, which is reckoned a sufficient distinction, as the other goddesses all wear badges. Sometimes she appears as the goddess of marriage; and is then veiled to the middle, and sometimes to the toes. She is known by the peacock, a bird sacred to her from the fable of Argus.

2. Minerva is very common on the coins of Alexander the Great; and her bust has been mistaken by the celebrated painter Le Brun for the hero himself. Her symbols are her armour; the spear in her right hand, and the ægis with a

Mecusa's head in her left; an owl commonly standing by her.

3. Diana of Ephesus is commonly represented on the Greek imperial coins; and appears with a great number of breasts, supposed to denote universal nature. She is supported by two deer, and carries a pannier of fruit upon her head. The bust of this goddess is known by the crescent on her brow, and sometimes by the bow and quiver at her side.

4. Venus is known by an apple, the prize of beauty, in her hand. Sometimes she is distinguished only by her total want of dress; but is always to be known by her extraordinary beauty, and is sometimes adorned with pearls about the neck.

5. Cupid is sometimes met with on the Syrian coins, and is known by his infancy and wings.

6. Cybele is known by a turreted crown and lion; or is seen in a chariot drawn by lions.

7. Ceres is known by her garland of wheat, and is common on the Sicilian coins; that island being remarkable for its fertility. Sometimes she has two serpents by her, or is drawn in a chariot by them. She carries in her hands the torches, as if in search of her daughter Proserpine.

8. Proserpine herself is sometimes met with on coins with the name of *κορη*, or the girl.

9. The Egyptian Isis has a bud or flower on her head; a symbol of the perpetual bloom of the inhabitants of heaven. She carries also a sistrum in her hand.

10. The Sidonian Astarte appears on a globe supported on a chariot with two wheels, and drawn by two horses.

These are the deities most commonly represented on the Greek coins. The more uncommon are, Saturn with his scythe, or with a hook on the Heracleian coins; Vulcan with his tongs, on the reverse of a coin of Thyatira, represented at work in the presence of Minerva. Adranus, a Sicilian god, is sometimes represented on coins with a dog. Anubis, an Egyptian deity, has a dog's head. Atis is known by his Phrygian bonnet; Castor and Pollux by a star on the head of each; Pluto by his old face, dishevelled hair and beard, and a hook; Flora by a crown of flowers; Nemesis by her wheel; and Pan by his horns and ears of a beast.

There are likewise to be found on medals many different symbols by themselves; of which we subjoin a list, with their significations:—

1. Vases with sprigs signify solemn games. 2. Small chest or hamper, with a serpent leaping out, mystic rites of Bacchus. 3. Anchor, on Seleucian medals, coin struck at Antioch, where an anchor was dug up. 4. Apollo, on Syrian coins, on an inverted hamper, covered tripod. 5. A bee, Aristeus, the son of Apollo. 6. Laurel, Apollo. 7. Reed, a river. 8. Ivy and grapes, Bacchus. 9. Poppy, Ceres and Proserpine. 10. Corn, Ceres. 11. Owl and olive, Minerva. 12. Dove, Venus. 13. Torch, Diana, Ceres, or Proserpine. 14. Mudnis, or conic stone, the Sun, Belus, or Venus. 15. Pomegranate flowers, Rhodes. 16. Owl, Athens. 17. Pegasus, Corinth. 18. Wolf's head, Argos. 19. Bull's

head, Boeotia. 20. Minotaur's head and labyrinth, Crete. 21. Horse's head, Pharsalia. 22. Lion, Marseilles. 23. Tortoise, Peloponnesus. 24. Sphinx, Scio. 25. Three legs joined, Sicily. 26. Horse, Thessaly. 27. The crescent, Byzantium. 28. Ensign, with the letters COL., a colony drawn from one legion. 29. Bull, Apis, strength or security. 30. Caduceus, Peace and concord. 31. Cornucopia, Abundance. 32. Parazonium, baton of command. 33. Globe on an altar with three stars, the world preserved by the gods for the three sons of Constantine I. 34. Fort and gate, Security. 35. Altar or tripod, Piety. 36. Dolphin, Apollo. 37. Lectisternia, festivals. 48. Lituus, or twisted wand, Augurship. 39. Apex, or cap with strings, pontificate. 40. Thensa, or chariot employed to carry images, consecration of an empress. 41. Peacock, ditto. 42. Eagle, consecration of an emperor.

The most remarkable symbols of countries and cities on Greek coins are, for Rhodes, the flowers of the pomegranate: for Athens the owl: for Corinth a pegasus: for Argos a wolf's head: for Boeotia a bull's head: for Crete a minotaur's head, and the labyrinth: for Pharsalia a horse's head: for Marseilles a lion: for Peloponnesus a tortoise: for Scio a sphinx: for Sicily three legs joined: and for Thessaly a horse. The badge of Byzantium was the crescent, which appeared early on the coins of Byzantium, with the legend *BYZANTINÆ EQT.*; the preserver of Byzantium. The occasion was this; when Philip of Macedon besieged Byzantium, and was proceeding to storm it in a cloudy night, the moon shone out, and discovered his approach, so that the inhabitants observed and repulsed him. The Turks, upon entering Constantinople, found this ancient badge in many places; and, suspecting some magical power in it, assumed the symbol and its power to themselves; so that the crescent is now the chief Turkish ensign. The bull is very frequent on Greek coins, generally signifying a river, on which the country or town was situated: accordingly, the river Achelous is called *Βουκεφάλος*, or bull-headed, by Sophocles in Trachin, v. 13: and Cephissus is said to have *ταυρομορφον ὄμμα Κηφισὸν παρὰ* by Euripides, Ion. v. 1261. The Latin poets speak of the horns of rivers; thus Horace describes the Aufidus, 'Sic tauriformis volvitur Aufidus.' The bull was a token of fertility, but the horns seem to allude to the force of the stream, &c.

SECT. III.—A CHRONOLOGICAL EXAMINATION OF ANCIENT COINS, MEDALS, &c.

The origin of coinage is too remote to be accurately traced. In the earliest ages in which metal was used as a medium of traffic, it is most probable that each person weighed or cut his gold or silver into pieces of different size and form, according to the quantity to be given for any merchandise he was desirous of purchasing. By degrees it was found more commodious to have pieces ready weighed; and as there were different weights required, according to the value of the different wares, all those of the same weight began to be distinguished by the same mark: thus coins were carried onward one step.

At length the use of money in commerce beginning to be disturbed by frauds, both in the weight and in the metal, public authority interposed, and hence arose the first stamps or impressions of money, to which succeeded the names of the moneyers and the effigy of the prince, the date, legend, &c., and thus the art was complete.

Herodotus ascribes the invention of coins to the Lydians, and Pliny to Bacchus; but it is evidently too remote an event to be traced to any authentic source. Lycurgus ordered that iron money only should be used in Sparta, which seems to imply that before his time a better kind had been known, and the introduction of copper coin into Italy is ascribed to Janus or Saturn. Before his invasion of Italy their money consisted of pieces of lead of certain weight and size. Homer, who wrote about 850, mentions scales, in the manner they seem to be mentioned in the book of Genesis (see our article COINS), but says nothing of money. If we look further east, says Mr. Pinkerton, there are three or four great nations who might be supposed capable of claiming this invention, namely, the Assyrians, Medes, Phœnicians, Indians, and Chinese: for the Persians are out of the question, as their empire began not till 570 years before Christ. The Assyrians, a great nation of the same race and speech with the Arabs and Phœnicians, conquered the Scythians, or oldest Persians, about 2220 years before Christ, and established the Assyrian empire; which lasted till the Medes, 920 years before our era, seized the north of present Persia; and in Babylon and the south, till Cyrus, about 570 years before Christ, established the Persian empire on the ruins of both Median and Babylonian. But certain it is that no coins are found which can be even imagined to belong to Assyrian, Median, or Babylonian kings; their empire, though rich in itself, was unknown in commerce; and weight alone, according to Scripture, was used in estimating metals. The oldest coins found in that part of the world are palpably Persian, and similar to the Greek.

The Phœnicians, a people famous for ancient civilisation, appear not to have coined money, till after the Greeks had set the example. No Phœnician coins are found of much antiquity; and not one without both obverse and reverse; nor is there cause to think any of them older than about 400 years before our era. From Scripture it also appears that weight alone was used in the famous cities of Tyre and Sidon; nor is there a hint in any ancient writer of coins peculiar to them or at all used by them.

India, though famous for its Brahmins and early civilisation and commerce, appears not to have any claim to early use of coinage. No Indian or Chinese coins exist, till within a late period: and those of both countries are so rude as hardly to deserve collecting.

Upon the whole the Lydian coins seem the most ancient in Asia. The wealth of the Lydian kings is famous in history and poetry: unhappily their coins have no legends, so that conjecture only points out the ancient coins in electrum and silver, found in Asia Minor, and different from the Persian, to be Lydian.

In Dr. Hunter's cabinet there is a gold coin weighing a tetradrachm which is extremely ancient. It has the usual rude globosity of early antiquity, and bears the indented marks of the first coinages on one side, while the other presents a man kneeling with a fish held out in his left hand, Lydia being a maritime country, and a sword depending in his right. It is of very pale gold, like electrum, which is owing to the want of art at first in refining the metal; which, as Pliny tells us, was often found mingled with a great deal of silver. When the silver was above one-fifth of the gold it was denominated native electrum; and, indeed, sometimes more highly valued by the ancients than gold itself. In the same drawer of that cabinet, among the uncertain coins, there are near a score of other gold coins, some of them not much inferior to this in apparent antiquity. Dr. Combe, who published them in his excellent description of Dr. Hunter's coins of cities, thinks the later ones, which are meant for one size of about forty grains, belong to the cities of Asia Minor. The oldest of them may have been struck there when coinage was proceeding from Lydia through Asia Minor towards Greece. The gold is in many extremely pale; and all, even those which bear the indented mark, are of a most exquisite fabric, surpassing all description; and as much superior to that of the best Sicilian coins as the later are to all other coins in the world.

The coins that must rank next in age to those of Lydia and the cities of Asia Minor are unquestionably those of Greece. The Greek coins, if not the most ancient which we have, are at least of superior antiquity to any whose claims can be clearly authenticated. Perhaps some of the Barbaric pieces, and probably some of the Lydian, may have a claim to priority of æra; but as such medals have no legends it is difficult to fix the precise date of their coinage.

The most ancient Greek coins of silver have an indented mark upon one side, and a tortoise upon the other; and those of greatest antiquity have no letters upon them. Those of latter date have ΑΙΠΙ marked upon them, which has been interpreted of Ægium in Achaia; but which is more probably a contraction of Ægina, the mint of which was much celebrated.

The general denomination of the Greek money is the drachma, or eighth part of an ounce; which to this day is retained in the medical weights, the Grecian coins receiving their names from the weights they bore; though in some instances the weights received their appellations from the coins. The silver drachma, according to Mr. Pinkerton, was about 9d. sterling; and he finds fault with those who make the drachma and denarius both equal to one another, the latter being no more than 8d. The didrachm of silver, according to the same calculation, was worth 1s. 6d.; but the tridrachm occurs very rarely: and medallists often give this name to the didrachm of Ægina. The largest of the Grecian coins is the tetradrachm, which on the Æginæan standard is worth 5s.; but in those of the other states only 4s. There are, however, many subdivisions in the silver drachma; the highest being the tetraobolion or coin of four oboli; being in proportion to the

drachma as our groat to 6d., weighing about forty-four grains, and being in value about sixpence. The hemidrachm or triobolion comes next in value, weighing about thirty-three grains, and worth fourpence half-penny. The silver diobolion or third of the drachma weighs about twenty-two grains, and is worth three pence. The obolus of silver weighs about eleven grains, and is worth only three halfpence. There is likewise a hemiobolion in silver, or half the obolus, of five grains and a half, value three farthings; and another called tetraobolion dichalos, or quarter obolus, which is the most minute coin yet met with; and by reason of its extreme smallness, weighing only two grains and a quarter, is now very scarce: but there is one in the cabinet of Dr. Hunter, and some of them are likewise met with at Tarantum. It would appear, however, that there were some still smaller, and of value only three-fourths of a farthing. None of these have been met with; and the smallness of the size renders it improbable that any will ever be met with: as the peasants, who commonly discover coins, would probably either not observe them at all, or, if they did, would neglect them as things of no value.

Many different names have been imposed on the coins belonging to the different states of Greece: thus Κορη, the maiden, was a name often applied to the tetradrachm, and which would seem to apply to those of Athens; Χελωνε, the shell, was the name of another coin from its type. A Sicilian coin was named Δεμαριον, from Gelon's wife. A tetradrachm was named Κραταγους, and had eight εθιας, or hemidrams. The τριτημνον, so called from its country Troizene, had Pallas on one side and a trident on the reverse. The hemiobolion was the Πελαγον of Lacedæmon; and the Κολλυβος is supposed to have been equal to the Roman sestertius or quarter drachma. The cystophori were coins with the mystic chest or hamper of Bacchus upon them, out of which a serpent rises; and are much celebrated in antiquity. The most probable opinion concerning them seems to be, that they are all silver tetradrachms; such as belong to the cities of Apamea and Laodicea in Phrygia; Pergamus in Mysia; Sardis and Tralles in Lydia; and Ephesus.

Another set of coins famous in antiquity were those of Cyzicus in Mysia, which were of gold; but they are now almost entirely vanished, being recoined in other forms. The Αριανδικον νομισμα, or money of Aryandes, who was made governor of Egypt by Cambyses, is mentioned by Hecataeus; but none of them have reached our times. They must have been marked with Persian characters, if with any. The coin of queen Philistis is mentioned by the same writer, and many of these pieces are still extant; but we know not where this queen reigned, nor does there seem to be any method of finding it out. The most particular attention with regard to the names and standard of coins is due to those of Athens; and it is remarkable that most of them which have reached us are of a very late period, with the names of magistrates inscribed upon them. Some of these bear the name of Mithridates; and few are older than the era of that prince; who, it is

well known, took the city of Athens in his war with the Romans. It is still more remarkable, that the fabric of Athenian coins is almost universally very rude: a singular circumstance if we reflect how much the arts flourished there. It can only be accounted for from the excellence of their artists being such as to occasion all the good ones to be called into other countries, and none but the bad left at home. In like manner, the coins struck at Rome in the imperial times are excellent, as being done by the best Greek artists; while those of Greece, famous at that time for producing artists, are during that period commonly of very mean execution.

The copper money of the Greeks is next in antiquity to the silver. It was not used at Athens till the twenty-sixth year of the Peloponnesian war: about A.A.C. 404, and 300 after silver was first coined there. The first copper coins were those of Gelo of Syracuse, about 490 B.C.

The whole brass coins of Athens published by Dr. Combe are reducible to four sizes, which may be the *lepton*, *dilepton*, *tetralepton* or *hemichalcos*, and *chalcos*. The first is not above the size of one of king James I.'s farthing tokens; the last about that of our common farthing. The *lepta* was also called *λεπτα*, as being change for the poor. The *επταβολος*, perhaps so called from the figure of a wolf upon it, was the coin of a particular state, and if of brass must have weighed three *chalci*. The other names of the copper coins of Greece are but little known. Lycurgus ordered iron money to be coined at Sparta; but so perishable is this metal that none of that kind of money has reached our times.

After the conquest of Greece by the Romans most of the coins of that country diminished very much in their value, the gold coinage being totally discontinued; though some of the barbarous kings who used the Greek character were permitted to coin gold, but they used the Roman model; and the standard used by the few cities in Asia who spoke the Greek language in the times of the emperors is entirely unknown. Copper seems to have been the only metal coined at that time by the Greeks themselves; and that upon the Roman standard, then universal through the empire, that there might be no impediment to the circulation of currency. They retained, however, some of their own terms, using them with those of the Romans. The *assarion* or *asarium* of Rome, the name or the diminished as, being sixteen to the *drachma* or *denarius*; the *obolus* was so much diminished in value as to be struck in brass not much larger than the old *chalcus*, and valued at between two and three *assaria*; which was indeed its ancient rate as to the *drachma*. This appears from the copper coins of Chios, which have their names marked upon them. The brass *obolus*, at first equal in size to the Roman *sestertius* or large brass, lessens by degrees to about the size of a silver *drachma*. From the badness of the imperial coinage in Greece also, it appears that brass was very scarce in that country, as well as in all the cities using the Greek characters, being found mostly in the western countries of the Roman empire. The time of this declension in size of the Greek coins is supposed to have been from

Augustus down to Gallienus. The copper *obolus*, however, at first above the size of large brass, was used in Greece about the time of its first subjection to Rome; and, the *lepta* ceasing, the *chalci* came in their room, with the *dichalcus* and the *hemibolion* of brass.

With respect to the gold coins of the Greeks, none of that metal it would seem was coined before the time of Philip of Macedon, as none have reached our times prior to the reign of that monarch.

Notwithstanding, however, this deficiency of gold coin among the Greeks, it is certain that the coinage of gold had taken place in Sicily long before; as we have gold coins of Gelo about 491 B.C., of Hiero I. 478, and of Dionysius I. in 404, all using the Greek characters; though not to be ranked among the gold coins of Greece, as Philip caused his to be.

Gold coins were used in the cities of Brettium, Tarentum, and throughout Magna Græcia: also in Panticapæa in Thrace, and likewise in Cosa in that country; but not in Tuscany, as is commonly believed, though Neumann proves that they were struck by Brutus, and are unquestionably as ancient as the Greek coins. The Thebans and Athenians probably coined the first gold after Philip had set them the example, and when they were attempting to resist the projects of that enterprising monarch. The Ætolians probably coined their gold during the time of their greatest power, about a century after Philip, and when they were combating the power of Aratus and the Achæan league. 'There is,' says Mr. Pinkerton, 'but one *μικρονομος* of Thebes, much worn, in Dr. Hunter's cabinet, and weighing but fifty-nine grains; and perhaps not above two or three *χρυσοι* or gold didrachms of Athens in the world; one of which is also in the collection of Dr. Hunter, and weighs 132½ grains. It appears to be more modern than the reign of Philip. That monarch, having got possession of the mines of Philippi in Thrace, improved them so much that they produced him annually above 1000 talents of gold, or £2,880,000 of our money. From this gold the first coins named from the monarch Philippi were struck. They were marked with his portrait; and for many ages after were so numerous that they were common in the Roman empire; whence the name Philippi became at length common to gold, silver, and at last even brass coins of their size. Even in the time of Philip gold was very scarce in Greece; but, after the Phocians had plundered the temple of Delphos, this precious metal, which had been valued as gems, and consecrated only to the decoration of the temples of the gods, began to be known among the Greeks. The comparative values of gold and silver, however, seem to have been at that time very different from what they are now. Herodotus values gold at thirteen times its weight in silver: Plato in his *Hippiarchus* at twelve; and even the low value of ten to one seems to have been the stated value in Greece, though in Rome the plenty of silver from the Spanish mines made the value of gold to be much higher; and there is no reason to think that it was ever valued in that city at less than twelve times its weight in silver. The Philippus, *χρυσοι*, gold piece, or stater, is a didrachm, and

is the most common of all the ancient coins. There are proofs of the Philippi being didrachms, both from the writings of ancient authors and from numbers of the coins themselves, which remain to this day ; and that the χρυσός, or principal gold coin of Greece, was of the same weight, is also evident from ancient writings. It was anciently worth about fifteen shillings, but, valuing gold now at the medium price of £4 per ounce, it is worth about twenty shillings. The σικυριεύς, or half the former coin, scarcely occurs of the coinage of Philip and Alexander, though it does of Hiero I. of Syracuse, and of king Pyrrhus. It passed for ten silver drachms, and was valued only at seven shillings and sixpence, though now worth ten shillings. There was another division of this kind worth about five shillings. There were besides some less divisions of gold coins, which could not be worth above two drachms. These were coined in Cyrene ; and there were besides several old gold coins of Asia Minor, the value of which is now unknown. Our author supposes that they were coined, not with relation to their weight as parts of the drachma, but merely to make them correspond with so many silver pieces as was necessary. There are also larger coins than the χρυσός, the Δαχρυεύς of Alexander and Lysimachus being double its value. Some others are met with of Lysimachus, Antiochus III., and some of the Egyptian monarchs, weighing four times the χρυσός, and now worth about £4 sterling.

Next are the Persian, which are well known, from the archer on them, and from Mithras, the Persian deity ; the dress of the princes and other marks. None of these coins can be older than 570 years before our era, when the Persian empire began. The famous Darics were issued by Darius Hystaspis, who began to reign 518 years before Christ. The joke of Agesilaus is well known, who being forced to retire from an invasion of Persia, by the bribery used by the great king to instigate the enemies of Sparta, said that 30,000 archers had defeated him. These coins are extremely scarce, being mostly melted down for his own coinage by Alexander the Great, upon his conquest of Persia. One, however, is in lord Pembroke's collection, having an archer upon one side, and the rude indented mark of early coinage on the other.

All the real darics are gold ; the silver coins with the archer are later, and never were called darics. Most of the Persian coins which have reached us are silver ; and have generally a king in a chariot of two horses, with a charioteer, and sometimes another figure on foot behind, on the obverse ; while the reverse presents a ship, the Persians being powerful at sea, as well as by land. Some have Persian characters. One in Dr. Hunter's cabinet has a ram on one side, with a long legend : the reverse has some sacred symbol in a hollow square. This symbol also occurs in the coins of the Sassanide. Another has a lion, another a bull. One has a fine Mithras, the Persian name of the sun, with his usual appearance of a bird's wings springing from his middle, and a bird's tail and feet : the obverse is a king, three quarters length, of fine

work. Some are of copper, very thick, with the king in a car on one side, and the ship on reverse.

But it will be proper to say a few words on the weight and ancient value of the Persian coins. The darics of Persia are celebrated in all antiquity ; and were gold coins, so called from Darius son of Hystaspes, who began to reign 518 years before our era. As the first gold coins of Macedon were called Philippi, from Philip the first king who coined gold ; it may, perhaps, be inferred from analogy, that the first gold coinage in Persia was known under Darius. The size and weight of these darics are subject to doubt. Josephus says they were equal to the tetradrachm in weight, and worth fifty Greek drachmæ. But we have many authors, one of them, Xenophon, particularly respectable, who informs us they were didrachms, and worth twenty Attic silver drachmas.

The darics are described by ancient writers as having the figure of an archer. There is one of these darics in lord Pembroke's cabinet, and weighs 129 grains, which shows them to have been didrachms on the Eubœic or Attic standard. The reader will see from the print of it, plate I, that it has the globosity and indented mark of early coinage ; perhaps longer retained in the east than in Greece. It is likely that the late bishop of Bagdat who resides in their native country, and had, as Mr. Ives tells us in his voyage to the East Indies, a large collection of Persian coins in all metals, may have had some in his possession. There is one piece, but of silver, in Dr. Hunter's cabinet, evidently Persian, which has a king on horseback on one side, and an archer kneeling in act to shoot on the reverse. It weighs 168 grains, and if the Babylonian talent, which seems to have been the standard of the Persian silver, was eighty Attic minæ, this would have been the didrachm of that talent.

But as gold was not the primitive coinage of Greece or Rome, so it is probable that silver preceded it in Persia ; and we have silver coins of Persia which bear every mark of remote antiquity. The most ancient, which are very rude, and have a shapeless hollow on the reverse ; with an archer on the obverse, but with his bow in one hand and arrow in the other, not shooting as in that above described, weigh about eighty-two grains. Others with a king's head on one side, and a ship on reverse, weigh about the first mentioned, or 164 grains ; some weigh fifty-three grains, and others about twenty-six. A fine one with a king three quarters length on one side, and Mithras on reverse, with his usual symbols of a bird's feet and tail, and the wings at his waist, weighs 160½ grains ; but is much worn on the sides, and must at first have reached the first, or 168 grains. There are four or five others, with a king in a chariot, a charioteer and attendant on one side, a ship on the other, of great size, not less than 432 grains, being more than seven Attic drachmas. I refer to those in the vast collection of the late Dr. Hunter, to which indeed I have been indebted for most of my references to coins. The above Persian coins, in particular, add much to the riches of

that wonderful cabinet, as hardly one of them is known to any other collection in Europe.

Of Persian coins there is a second series, that of the Sassanids, beginning about A.D. 210, when Artaxerxes overturned the Parthian monarchy. The Parthian coins have all Greek legends, as before mentioned; but these later Persian bear only Persian characters. They are large and thin; with the king's bust on one side, and the altar of Mithras on the other, generally with a human figure on each side, as the reader will see in the fine specimen, plate I. The Persian letters are the only ones of antiquity which have not been explained, though so many specimens remain. The oldest inscriptions at Persopolis are in those called Scandinavian antiquaries. Palmyrene or Syriac inscriptions also occur there. But the letters on Persian coins are peculiar, and no attempt has yet been made to explain them. They seem to partake of the ancient Greek, Gothic, and Alanic. The later Persian coins extend to the year 636, when Persia was conquered by the Arabian caliphs.

In Rome, as well as in Greece, the money was at first estimated by weight; and the first metal coined by that people was copper, silver being long unknown in Rome; nor is it certainly known that any silver has ever been found in the Italian mines. In Rome the first valuation of money was by the *libra gravis æris*, or pound of heavy brass; and, in the progress of their conquests, the little silver and gold that came in their way was regulated by the same standard, as appears from the story of Brennus. The weights made use of were the same with those which continue to this day. The pound consisted of twelve ounces of 458 grains each; but the pound by which the money was weighed appears to have consisted only of 420 grains to the ounce, or to have contained in all 5040 grains. This became the standard of copper; and, when silver came to be coined, seven denarii went to the ounce as eight drachms did in Greece. Gold was regulated by the *scriptulum* or *scrupulum*, the third part of a denarius, and by the larger weights just mentioned. The number 10 was at first used by the Romans in counting their money; but, finding afterwards that a smaller number was more convenient, they divided it into quarters; and, as the quarter of ten is two and a half, they for this reason bestowed upon it the name of *sestertius* or 'half the third;' to express that it was two of any weights, measures, &c., and half a third; whence the *sestertius* came at last to be the grand estimate of Roman money. The *as* being at first the largest, and indeed the only Roman coin, the word *sestertius* means *sestertius as*, or 'two asses and a half.' On the first coining of silver, the *denarius* of ten asses was struck in the most common and convenient denary division of money, or that by tens; the *sestertius* being of course two asses and a half. But, the *denarius* being afterwards estimated at sixteen asses, the name *sestertius* was still applied to a quarter of the *denarius*, though it now contained four asses. The term *sestertius* was applied to all sums not exceeding 1000 *sestertii*, or £8 6s. 8d.; but for greater sums the mode of the *sestertius* was likewise altered, though not to exclude the former.

Very large sums of money were estimated by the hundred weight of brass; for the Romans were at first unacquainted with the talent. The hundred weight, by way of eminence, was distinguished by the name of *pondus*, and *sestertium pondus* became a phrase for 2½ cwt. We may value the *as libralis* of ancient Rome at about eight-pence English. Estimating the *as* therefore at a pound weight, the *sestertium pondus* was equal to 1000 *sestertii*, or £8 6s. 8d. and, by a coincidence which our author supposes to have been the effect of design, as soon as the silver coinage appeared, the *sestertium centum denariorum* was always equal to *sestertium* £8 6s. 8d. also. The word itself, however, seems to have been unknown prior to the coinage of silver money at Rome: the *pondera gravis æris* being sufficient before that time for all the purposes of a state in which money was so scarce. But, however this may be, the *pondus* or hundred weight of brass was precisely worth 100 *denarii*, or a pound of silver. As the great *sestertium* was always valued at 1000 of the smaller, or £8 6s. 8d., we never find one *sestertium* mentioned in authors, but two, three, or more; 10,000 of them being equal to £8,333,333 6s. 8d.

Some coins are found which exceed the *as libralis* in weight; and these are supposed to be prior to the time of *Servius Tullius*. Some of them are met with of thirty-four and of fifty-three Roman ounces; having upon one side the figure of a bull rudely impressed, and upon the other the bones of a fish. They are most commonly found at Tuder, or Tuderum in Umbria; but they appear always broken at one end; so that perhaps some might be struck of the *decussis* form, or weighing ten pounds. These pieces make it evident that the Romans derived their large brass coins from the Etruscans and the neighbouring states: they are all cast in moulds; and the greater part of them appear much more ancient than the Roman asses, even such as are of the greatest antiquity.

Mr. Pinkerton agrees with Sir Isaac Newton as to the time that *Servius Tullius* reigned in Rome, which he supposes to be about 460 B.C. His coinage seems to have been confined to the *as*, or piece of brass having the impression of *Janus* on the one side and the prow of a ship on the other, because *Janus* arrived in Italy by sea. *Varro*, however, informs us that the very first coins of *Tullius* had the figure of a bull or other cattle upon them, like the Etruscan coins, of which they were imitations. Those with the figure of *Janus* and the prow of a ship upon them may be supposed first to have appeared about 400 B.C.; but, in a short time, various subdivisions of the *as* were coined. The *semis* or half is commonly stamped with the head of *Jupiter laureatus*; the *triens* or third, having four cyphers, as being originally of four ounces' weight, has the head of *Minerva*; the *quadrans* or quarter, marked with three cyphers, has the head of *Hercules* wrapt in the lion's skin; the *sextans* or sixth, having only two cyphers, is marked with the head of *Mercury* with a cap and wings; while the *uncia*, having only one cypher, is marked with the head of *Rome*. All these coins appear to have been cast in moulds, by a con-

siderable number at a time; and in the British Museum there are four of them all united together as taken out of the mould in which perhaps dozens were cast together. In process of time, however, the smaller divisions were struck instead of being cast; but the larger still continued to be cast until the as fell to two ounces. Even after this time it was still called *libra*, and accounted a pound of copper: though there were now larger denominations of it coined, such as the *bissas* or double as: *tressis* and *quadrussis* of three and four asses; nay as far as *decussis* or ten asses, marked X. Olivieri mentions one in his own cabinet weighing upwards of twenty-five ounces, and cast when the as was about three ounces' weight. There is likewise in the *Musæum Etruscum* a *decussis* of forty Roman ounces, cast when the as was at four ounces. There was likewise a curious *decussis* in the Jesuits' library at Rome, for which an English medallist offered £20; but it was seized by the pope along with every other thing belonging to the society.

The as decreased in weight at the following periods. About the year 300 B. C. it weighed ten ounces—eight ounces about 290—six ounces about 280—four ounces about 270—three ounces about 260—two, according to Pliny, about 250—one according to the same author, about 214—and about 175 he says that the as was reduced to half an ounce by the Papyrian law, at which it continued till the time of Pliny himself, and long after.

After the Romans began to have an intercourse with Greece a variety of elegant figures appear upon the parts of the as, though not on the as itself till after the time of Sylla. Towards the latter end of the republic also, *dupondii*, or double asses, were coined, together with the *sestertii ærei*, which came in place of the *quadrusses*, when the *denarius* began to be reckoned at sixteen asses; probably at the time the latter was reduced to half an ounce. In some instances it is to be observed that the Romans accommodated their coins to the country where their army was stationed; whence we have many coins marked as Roman, which have been coined in *Magna Græcia* and *Sicily*, and are evidently upon the Greek and not the Roman scale. In the latter part of the republican times, also, the types begin to vary; so that we have a brass coin supposed to be struck by *Sextus Pompeius* in *Sicily*, having upon it a double head of that warrior, representing a *Janus*. This coin is of copper, and still weighs an ounce, notwithstanding its antiquity.

The largest imperial copper coin was the *sestertius*, a piece worth about two-pence of our money.

No change took place in the Roman coinage from the time that the as fell to half an ounce to the days of Pliny: but before the time of Julius Cæsar yellow brass began to be used, and was always looked upon to be double the value of Cyprian or red copper. There are but few coins in large brass immediately before Julius Cæsar, or even belonging to that emperor; but from the time of Augustus downward, the large coins are all found of brass, and not one of them copper. The largest of what are called the middle size are all

of yellow brass; and the next size, which is the as, and weighs half an ounce, is universally copper. What the ancients named *orichalcum*, or what we call brass, was always looked upon to be greatly superior in value to the *æscyprium*. *Procopius* tells us that brass inferior in color to gold is almost equal in value to silver. The mines of native brass were very few in number, and were owing entirely to the singular combination of copper and *lapis calaminaris* in the bowels of the earth, which very seldom occurs; and the ancients were far from being well acquainted with the method of combining these two bodies artificially; so that yellow brass was always esteemed at double the value of copper: and hence, in the ancient coinages, the brass and copper pieces were kept as distinct as those of gold and silver.

The *sestertius* underwent no change till the time of Alexander Severus, when it was diminished by one-third of its weight. *Trajanus Decius* was the first who coined double *sestertii*, or *quinarii*, of brass: but from the time of *Trebonianus Gallus* to that of *Gallienus*, when the first brass ceases, the *sestertius* does not weigh above the third part of an ounce; the larger coins are accounted double *sestertii*; and after the time of *Gallienus* it totally vanishes. In the time of *Valerian* and *Gallienus* we find a new kind of coinage, mentioned by the name of *denarii æris*, or *Philippi ærei*. Two sizes of *denarii* began to be used in the time of *Caracalla*, the larger of six *sestertii*, or twenty-four *assaria*; the smaller of four *sestertii*, or sixteen *assaria*, as usual. In the time of *Pupienus* the latter was reduced to such a small size as not to weigh more than thirty-six grains; though in *Caracalla's* time it weighed fifty-six. After the time of *Gordian III.* the smaller coin fell into disuse, as breeding confusion. The larger *denarius* of six *sestertii*, though diminished at last to the size of the early *denarius*, still retained its value of six *sestertii*, or twenty-four *assaria*. The *Philippus æreus* came at length in place of the *sestertius*. It was also called *denarius*; from which we may learn, not only their size, but that they were in value ten *assaria*, as the first *denarius*. In the reign of *Dioclesian*, the place of the *sestertius* was supplied by the *follis*, that emperor having restored the silver coin to its purity, and likewise given this form to the copper; but it would seem that this restoration of the coinage only took place towards the end of his reign; whence we have but few of his silver coins, and still fewer of the *follis*, though the *denarii ærei* continue quite common down to the time of *Constantine*. The *follis* of *Dioclesian* seems to have weighed above half an ounce; and that *Dioclesian* designed this coin to supply the place of the *denarius æreus*; which of course was worth ten *assaria*, and six of them went to the silver *denarius*. From this time the *assarium* diminishes to the size of thirty grains; and soon after the *follis* appeared the *denarius æreus* was entirely dropped, the former having gradually supplied its place. Some mints appear to have retained the use of the *denarius* longer than others; and in some the change was preceded, and gradually brought in, by washing the *follis* with silver or

tin as the denarius had formerly been. Pieces of this kind occur in the times of Dioclesian, Maximian I. and II., and Constantius I.; that is, for about ten years after the follis made its appearance. Some countries, however, retained the denarius æreus; others the follis; and some had a medium betwixt the two, or the follis washed in imitation of the denarius.

Towards the end of the reign of Constantine I. a new coinage was introduced throughout the whole empire. The follis coined by this prince was of half an ounce weight; twenty-four of them going to the milliarenis, or larger silver coin. The word follis signifies also a purse, in which sense we sometimes find it mentioned in the Byzantine history. The common follis of silver, when it occurs by itself, means a purse of 250 milliarenis, as the sestertium was 250 denarii; and, by a law of Constantine I., every man paid to the state a follis or purse according to his income. The method of counting by purses continues in Turkey to this day.

The dupondius was only half the value of the sestertius, or about one penny sterling; and before the yellow brass appeared it seems to have been struck upon copper, and double the size of the as. There are some of this coin, struck in the time of Julius Cæsar in yellow brass, weighing half an ounce; with a head of Venus Victrix upon one side; on the reverse a female figure, with serpents at her feet; while others have a Victory on the reverse, with *Q. Oppius Pr.* After the time of Augustus the dupondius was struck in yellow brass; which Pliny tells us was also the case in his time. The word dupondiaris seems to have been used by Pliny, and adopted, not to express that the coin was dupondius, but that it was of dupondiar value. Neither was the former word confined to signify double weight, but was used also for double length or measure, as in the instance of dupondius pes, or two feet, &c. In the imperial times, therefore, dupondius was used, not to signify a coin of double the weight of the as, but of double the value. It was one of the most common of the Roman coins; and seems to have been very common even in Constantinople. The dupondius, though of the same size with the as, is commonly of finer workmanship, the metal being greatly superior in value. It continued to be of yellow brass, as well as the sestertius, to the time of Gallienus; but the as is always of copper.

The imperial as, or assarium, was worth only a halfpenny. At first it weighed half an ounce, and was always of copper till the time of Gallienus, when it was made of brass, and weighed only the eighth part of an ounce. From the time of Gallienus to that of Dioclesian it continued to diminish still more, the size being then twenty to an ounce. This was the same with the lepta, or smallest coins but the *novæ*, which weighed only ten grains.

The parts of the as occur but seldom; which may indeed be well expected considering the low value of it; though there still occur some of those called semis, triens, quadrans, sextans, and uncia, coined in the times of Nero and Domitian. There is no small brass from the time of Perti-

max to that of Gallienus, excepting that of Trajanus Decius; but in the time of Gallienus it becomes extremely common; and the coins of small brass, as well as the larger, are always marked S. C. (such as want it universally being accounted forgeries), and were plated with silver, though the plating be now worn off. The small pieces struck for slaves during the time of Saturnalia must also be distinguished from the parts of the as. The S. C. upon these most probably signifies Saturni Consulta, and were struck in ridicule of the true coins, as the slaves on that occasion had every privilege of irony.

The sestertius diminishes from Pertinax to Gallienus so fast that no parts of the as are struck, itself being so small. Trajanus Decius, indeed, coined some small pieces, which went for the semis of the time. The small brass coins under Gallienus were called assaria, sixty of which went to the silver denarius. They are about the size of the denarius, and some of them occur, of the coinage of Gallus and his family, of half that size, which appear to have been struck during the latter part of his reign, when the assarium was diminished to a still smaller size. It is probable, however, that some of these very small coins had been struck in all ages of the empire, in order to scatter among the people on solemn occasions.

The assarion or lepton of the Constantinopolitan empire was one of the smallest coins known in antiquity, weighing no more than twenty grains; and the noumia were the very smallest which have reached our times, being only one-half of the former. By reason of their extreme smallness they are very scarce; but Mr. Pinkerton had a fine one of Theodosius II. which has on it the emperor's head in profile, Theodosius P. F. AV.; on the reverse a wreath, having in the centre *VOT. XX. MUL. XXX.*

The principal coin of the lower empire was the follis, which was divided into a half and a quarter, named *μυροπολεος* and *τετραπρον*; the latter of which is shown by Du Cange to have been a small brass coin. Besides these the follis was divided into eight oboli, sixteen assaria or lepta, and thirty-two noumia, though in common computation it contained forty of these last. This coin, notwithstanding so many divisions, was of no more value than a halfpenny.

There are pieces of Justinian which weigh a whole ounce; but the size of copper was increased as the silver became scarcer; and the value of the coinage cannot be deduced from the weight of the coins, as it is plain that our own coinage is not of half the value with regard to the metal. A great number of medallions were struck by Constantius II., but there is no other copper larger than the half ounce, excepting that of Anastasius, when the follis began to be struck larger. All medallists allow the others to be medallions.

The metal employed in these very small coins, though at first of brass, was always a base and refuse kind; but copper is generally made use of in the parts of the as from the earliest times to the latest; and if brass be sometimes employed it is never such as appears in the sestertii and dupondiarri, which is very fine and beautiful,

but only the refuse. Yellow brass of the right sort seems totally to have ceased in the Roman coinage with the *sestertius*, under Gallienus, though a few small coins of very bad metal appear under that hue as late as Julian II.

Silver began to be coined in Rome so late as A. U. C. 485, or A. A. C. 266.

The first silver *denarii* coined at Rome are supposed to have been those which are impressed with the *ROMA*. There are fifteen of these in the cabinet of Dr. Hunter; one of the largest weighs ninety-eight grains and a quarter; and the rest, which seem to be of greatest antiquity, are of various weights betwixt that and eighty-four; the smaller and more modern weigh fifty-eight or fifty-nine grains; but the large ones are of the very first Roman coinage, and struck during that interval of time betwixt the coinage of the first silver *denarius* and the *as* of two ounces. The indentation of the word *ROMA* is a mark of great antiquity; such a mode being scarcely known any where else, except in Caulonia, Crotona, and other towns of Italy; all of them allowed to be struck at least 400 B. C. As these large coins are not double *denarii* they must have been struck prior to the small ones; and Newmann has given an account of one of them recoined by Trajan, in which the indentation of *ROMA* is carefully preserved. The first *denarius* was in value ten asses, when the *as* weighed three ounces; and, allowing ninety grains at a medium for one of these large *denarii*, the proportion of copper to silver must have been as one to 160; but when the *as* fell to one ounce the proportion was as one to eighty; when it fell to half an ounce, so that sixteen asses went to the *denarius*, the proportion was as one to sixty-four, at which it remained. Copper with us, in coinage, is to silver as one to forty; but in actual value as one to seventy-two.

At Rome the *denarius* was worth eight pence; the *quinarius* four pence; and the *sestertius*, whether silver or gold, two pence. The *denarius* is the coin from which our penny is derived, and was the chief silver coin in Rome for 600 years. According to Celsus, seven *denarii* went to the Roman ounce, which in metals did not exceed 430 grains; but, as all the *denarii* hitherto met with weigh at a medium only sixty grains, this would seem to make the Roman ounce only 420 grains; though perhaps this deficiency may be accounted for from the unavoidable waste of metal even in the best preserved of these coins. According to this proportion, the Roman pound contained eighty-four *denarii*; but in tale there was a very considerable excess; for no fewer than 100 *denarii* went to the Roman pound. The Greek ounce appears to have been considerably larger than that of Rome, containing about 528 grains; yet, notwithstanding this apparently great odds, the difference in the coins was so small, that the Greek money went current in Rome, and the Roman in Greece. The *denarius* at first went for ten asses, and was marked X; it was afterwards raised to sixteen; which Mr. Pinkerton supposes to have been about 175 B. C. Some are met with bearing the number XVI; nay, with every number up to CCCCLXXVI. These large numbers are

supposed to have been mint-marks of some kind or other. After being raised to sixteen asses, it continued at the same value till the time of Gallienus; so that, till that time, we are to look upon its constituent parts to be sixteen asses or *assaria*, eight *dupondii*, four brass *sestertii*, and two silver *quinarii*. Under the emperor Severus, however, or his successor Caracalla, *denarii* were struck of two sizes, one of them a third heavier than the common; which we must of consequence suppose to have borne a third more value. This large piece obtained the name of *argenteus*, and *argenteus Philippus*, or the 'silver Philip;' the name of Philip having become common to almost every coin. The common *denarii* now began to be termed *minuti* and *argentei Philippi minuti*, &c., to express their being smaller than the rest. Some have imagined that the large *denarii* were of the same value with the small, only of worse metal. The first mention of the *minuti* is in the time of Alexander Severus, who reduced the price of pork from eight *minuti* at Rome to two and to one. The *minutus argenteus* of that age was about forty grains; and, from the badness of the metal, was not worth above four pence of our money.

According to Zozimus, and other writers, the purity of the Roman coin was restored by Aurelian; and his successor Tacitus is said to have allowed no brass to be mixed with the silver on any account; yet the few coins of this emperor are very much alloyed. We are certain, however, that the emperor Dioclesian restored the silver to its ancient purity; the *denarii* struck in his reign being very small indeed, but of as fine silver as the most ancient coins of the empire. After Gordian III. the small *denarius* entirely vanished, while the large one was so much diminished that it resembled the *minutus*, or small one of Caracalla, in size. Gallienus introduced the *denarii aerei* instead of the *sestertii*. The *argenteus*, though reduced more than one-third in size, contained six *denarii aerei*, the old standard of the *sestertii*. According to the writers of this period, and some time afterwards, the *denarius argenteus* contained sixty *assaria*; whence it follows that each *denarius aereus* had ten; and from this it probably had its name. The *assaria* are of the size of the *argentei* already mentioned; and show the copper to have retained nearly its old proportion of value to the silver, viz. one to sixty.

A larger silver coin was introduced by Constantine I., who accommodated the new money to the pound of gold in such a manner that 1000 of the former in tale were equal to the latter in value; so that this new piece from thence obtained the name of the *milliarius*. Its weight, at a medium, is seventy grains, or seventy to the pound of silver. The code says that sixty went to the pound; but the numbers of this are quite corrupt. The *milliarius* was worth about a shilling sterling. The *argentei denarii*, however, were still the most common currency; and, having been originally rated at the 100 to the pound of silver in tale, they from hence began to be called *centenionales*, or 'hundreders.' Those of Constantine I. and II., *Constantians* and *Constantius*, weigh from fifty

grains down to forty; those of Julian and Jovian, from forty to thirty; and of the succeeding emperors, from that time to Justinian, from thirty to twenty. Under Heraclius they ceased entirely; and, from Justinian to their total abolition, had been brought down from fifteen to ten grains. A like decrease of weight took place in the milliarensis; those of Constantine and Constans being above seventy grains in weight; those of Arcadius not above sixty; and the milliarensis of Justinian not more than thirty grains. These coins were also called majorine.

The smaller silver coins of Rome were, 1. The quinarius, at first called victoriatu, from the image of Victory on its reverse; and which it continued to bear from first to last. Its original value was five asses, but it was afterwards raised to eight, when the value of the denarius increased to sixteen. According to Pliny, it was first coined in consequence of the lex Clodia, about the 525th year of Rome. Some are of opinion that it was called *separat* under the Constantinopolitan empire, because it was worth a *separat* of gold, 144 of which went to the ounce; but this is denied by Pinkerton, because, at the time that the word *separat* first appears in history, the denarius did not weigh above thirty grains: and of consequence, as twenty-five must have gone to the gold solidus, of which there were six in the ounce, 150 denarii must have gone to the ounce of gold. He is therefore of opinion that the word *separat* was only another name for the denarius when much reduced in size; probably owing to the great scarcity of silver in Constantinople, though in the same city there was plenty of gold; and of consequence the gold solidus was never diminished. The quinarius diminishes in size along with the other coins; those of Augustus weighing thirty grains, of Severus twenty-five, of Constantine I. twenty, of Justinian twelve, and of Heraclius only five. A new silver coinage seems to have taken place after the days of this emperor; as the little we then meet with, which in the best cabinets scarce exceeds a dozen of coins, consists entirely of large unshapely pieces of coarse metal.

2. The consular denarius had also four silver sestertii, till the as fell to half an ounce, when it was thought proper to coin the sestertius in brass, as it continued to be ever afterwards. 'The very last silver sestertius which appears is one with a head of Mercury, and H. S.; on the reverse a caduceus P. SEPTILLIVS; who appears to be the P. SEPTILLIVS MACER of the denarii of Julius Cæsar. If so, as is most probable, the sestertius was coined in silver down to Augustus; and it is of course not to be expected that any of the brass can appear till Augustus, under whom they are actually quite common. Not one silver sestertius appears during the whole imperial period; yet we know that the sestertius was the most common of all silver coins. The consular sestertii of silver, marked H. S., are not uncommon, nor the quinarii; but the latter are very scarce of all the emperors, if we except one instance, the ASIA RECEPTA of Augustus.

The Roman gold coinage was still later than that of silver. Pliny tells us, that 'gold was coined sixty-two years after silver; and the

scruple went for sixty sesterces. It was afterwards thought proper to coin forty pieces out of the pound of gold. And our princes have by degrees diminished their weight to forty-five in the pound.' This account is confirmed by the pieces which still remain; for we have that very coin weighing a scruple, which went for twenty sesterces. On one side is the head of Mars, and on the other an eagle; and it is marked XX . We have another coin of the same kind, but double, marked XXX ; and its triple XXX , or sixty; the V being the old numeral character for fifty.

The aurei, or Roman gold coins, were at first forty-eight in the pound; but they were afterwards diminished in number to forty, owing to an augmentation in the weight of each coin. In the time of Sylla, the aureus weighed no less than from 164 to 168 grains, and there were only thirty in the pound; but such confusion in the coinage was introduced by that conqueror, that no person could know exactly what it was worth. Till this time the aureus seems to have continued of the value of thirty silver denarii, about one pound sterling; for about that time it was enlarged a whole third, that it might still be equivalent to the full number of denarii. But after Sylla had taken Athens, and the arts and manners of Greece became objects of imitation to the Romans, the aureus fell to forty in the pound, probably when Sylla had abdicated his dictatorship. Thus, being reduced near to the scale of the Greek χρυσος, it passed for twenty denarii, as the latter did for as many drachmas, being in currency thirteen shillings and four pence sterling. We know from Suetonius that Cæsar brought from Gaul so much gold that it sold for nine times its weight of silver; but the Gallic gold was of a very base sort.

In the time of Claudius, the aureus was valued at 100 sesterii, or twenty-five silver denarii, at which it continued till the time of Heliogabalus, when it fell to about ninety-two grains at a medium, or rose in number to fifty-five in the pound. In the reign of Philip, during which the city completed its 1000th year, the aureus was coined of two or three sizes. These are impressed with a head of Rome on one side, and various figures on the other; but the workmanship is so rude that they are supposed to have been struck in some of the more uncivilised provinces of the empire. The practice of having different gold coins, however, continued under Valerian, Gallienus, and his successors. In the time of Gallienus, they were of thirty, sixty-five, and from eighty-six to ninety-three grains; the double aurei being from 172 to 183½ grains; but the aureus, properly so called, was from eighty-six to ninety-three; those of thirty and thirty-two being the trientes aurei of the Historiæ Augustæ Scriptores; while the larger, from sixty-two to sixty-five, are to be accounted double trientes, and were perhaps called minuti aurei. The value of these different sizes of aurei is not known.

That Aurelian made some alteration in the coin is certain; but Pinkerton supposes it to have been only in the gold; because, under him and his successor Probus, the common aureus was of 100 grains; a size confined to those emperors; there are likewise halves of about fifty grains; and double aurei, commonly of very

fine workmanship, of upwards of 200 grains. In the time of Gallienus, the precious metal was so common that this emperor vied in magnificence with Nero and Heliogabalus. Aurelian, who plundered the rich city of Palmyra, and thus became master of the treasures of the east, obtained such a profusion of gold that he looked upon it to be produced by nature in greater plenty than silver.

In his reign a terrible rebellion took place among the money coiners, which is generally ascribed to his having ordered the gold to be restored to its former size, but to pass for no more silver than it had formerly done. So very little silver occurs of this period (and indeed we learn from history that but little was struck) that it is evident no alteration in that coinage could occasion disturbance; and in the brass no change was attempted. But when he ordered the aureus, which had fallen to eighty grains, to be raised to about 100, it is not surprising that the contractors should make an uproar; for a whole quarter of their coinage amounting, as would seem, to about the whole of their profit, was lost to them. Aurelian judged that, when he found gold so common in the east, it was equally so in the west, and that therefore the moneyers in that part of his empire were making most exorbitant profits. Such, however, does not appear to have been the case; and after his short reign, which did not continue above five months after the alteration, the gold returned to its former course, although a few pieces occur of Aurelian standard, struck, as would seem, in the commencement of the reign of Probus his successor.

From this time to that of Constantine I. the aureus weighed between seventy and eighty grains; but in his reign it was changed for the solidus, of which six went to the ounce of gold, which went for fourteen milliarense and twenty-five denarii as before, the value of silver being now to that of gold as fourteen to one. This new coin continued of the same value until the final downfall of the western empire, gold being always very plentiful in Constantinople, though silver became gradually more and more scarce. The solidus was worth twelve shillings sterling. The gold coins called Bezants in Europe, because sent from Byzantium, were solidi of the old scale, six to the ounce. In Byzantine writers the solidi are named from the princes whose portraits they bear, as Michaelate Manuclati. Solidus is a term used also for the aureus, even in the prætorian edicts of Trajan, and by Apuleius, who lived in the time of Antoninus; but in the time of Valerian, when aurei of different sizes had been introduced, it became necessary to distinguish what particular kind of aurei were meant. Hence, in the Imperial Rescripts published by the Historiæ Augustæ Scriptores, Valerian uses the terms aurei Philippi and Philipeos nostri vultus for the common aurei. Gallienus uses aurei Valeriani for his father's coins; aurei Antoniani are likewise put by Valerian for coins of the early Antonini, which were of superior standard to any then used.

In the first gold coinage of Rome the aureus was divided into four parts, the semissis of sixty sesterii; the tremissis of forty; the fourth, the name of which is never mentioned, of thirty;

and the scrupulum of twenty. But in a short time these fell into disuse, except the semissis, or half, which also is extremely scarce. It appears to be an erroneous opinion that the semissis was sometimes called a denarius aureus. Indeed the aureus itself had this name; and the name of quinarius would be applied to the semissis with greater propriety than the former. Trientes of gold are found of Valerian and his son Gallienus, and weigh about thirty grains, while those of Salonia, the wife of Gallienus, weigh thirty-three grains. Under the western empire trientes again made their appearance; and from the time of Valentinian downwards are the most common gold coins, these being worth about four shillings sterling. The semissis is likewise mentioned, but none occur earlier than the time of Basiliscus. The gold tremissis was the pattern of the French and Spanish gold coins; as the silver denarius, in its diminished state, was of the Gothic and Saxon penny.

The deities and personifications in Roman coins have so generally their names in the legend, that it is not necessary to give any lengthened description or explanation of them; some few may however be noticed. When an ensign stands alone on the reverse of a Roman colonial coin, without any persons, it shows a colony drawn from one legion; but when more than one ensign appears, it evinces the colony to have been drawn from as many legions as there are ensigns. A bull on these coins often represents Apis as a symbol of strength and security: such was probably the bull upon the reverse of the common coin of India, *VICTA*, with two stars over him, and the legend *SECURITAS REIPUB*. The caduceus marks peace and concord; the cornucopia abundance; the pontifical hat the priesthood. They all appear upon a reverse of Julius Cæsar, and are symbols of the concord of the empire, and the plenty which attended his power; the last symbol denoting that he was Pontifex Maximus. The 'parazonium' on Roman coins was a baton of command, and not a pointless dagger, as it has been described by many antiquaries. In later times the globe on an altar, with three stars, is supposed to typify the world preserved by the gods for the three sons of Constantine I. The fort and the gate are symbols of security. The altar is a well known mark of piety: the tripod was a portable altar, used in temples for liquid offerings, as the altar was for solid sacrifice.

The palm-tree, on both Greek and Roman coins, is symbolic of Phœnicia, where that tree flourished; as the silphium is of Cyrene, from the earliest times down to those of the western empire.

Titles are generally found upon the face of the medal. These are titles of honor, as Emperor, Cæsar, Augustus, given to all the Roman emperors after Octavianus; Dominus, first assumed by Aurelian: other titles given to particular persons on account of their virtues, as Pius to Antoninus, and with the addition of Felix to Commodus. Pater Patriæ, first bestowed on Cicero, on his discovering and defeating the conspiracy of Catiline, and afterwards assumed by the emperors; Justus, the title of Pescennius; Beatissimus and Felicissimus, of Diocle-

stan; Optimus et Clemens, decreed to Trajan by the senate; Maximus, assumed by Constantine; and Invictus by Victorinus. In the lower empire, Stauracius first, and then Michael Ducas, and others, assumed the proud addition of ΒΑΣΙΛΕΥΣ, or king; which was followed by that of ΔΕΣΠΟΤΗΣ, or despot. Other titles are the names of offices, as cos. for consul, with a number annexed to it, signifying how many times the person had been thus elected: Tribunitia potestas, with the year of the tribuneship commonly expressed after the title, as TRIB. POT. X. or XVI., &c. The office of pontifex maximus, expressed by P. M., was assumed by the emperors, and generally expressed among their titles, from Augustus to Constantine, by whom it was refused: it was re-assumed by Julian, and laid aside by Gratian. Julius assumed the title of dictator perpetuus; Claudius that of censor; and Domitian made himself censor perpetuus.

The large early copper coins only bear ROMA in the reverse. Afterwards we find the names and titles of the quæstor or director of the public treasury, the triumviri monetæ, who directed the mint; the prætor, the curule ædile, the ædile of the people; the præfect of the city, augur, flamen martialis and quirinalis; and latterly, triumvir reipublicæ constituendæ, and ad frumentum emundum. Of the great magistrates out of Rome, who had moneyers with them, in order, from bullion and the spoil of the enemies, to coin money for paying the troops engaged in foreign service, we have the names and titles of imperator, proconsul, proprætor, legatus, legatus pro prætore, quæstor, proquæstor, legatus classis, triumvir colonie deducendæ, or reficiendis sacris ædibus. All these titles appear on the reverses of what are called consular coins; while the obverse bears the head of a deity, generally without a legend. In time the magistrates put the head of some illustrious ancestor on the coins, with his name, as Numa, Ancus Martius, Quirinus, or Romulus; Brutus, Ahala, and the like. This led the way to Cæsar, who first put his own head on his coins, when made perpetual dictator; with the legend of names and titles on the obverse, and not on the reverse as before. The inscription VOT. V. MVLTI. X. VOT. X. MVLTI. XX. occurs on many reverses of Roman medals, and most commonly marked on a shield, or within a crown of laurel. This Du Cange interprets to refer to the artifice of Augustus, who pretended to lay down his power, and resume it for ten years longer as at the request of the senate. This term, he says, was by succeeding emperors shortened to five; and solemn vows were entered into by their subjects for their safety to the end of that period; nay, that the double of that period might be allotted to their reign, again to be prolonged, on the wishes of their people, to a future date. This inscription is also found upon coins of Crispus, and other heirs of the empire; and it hence appears that the honor of such solemnities was also conferred on them, when created Cæsars. The 'vota decennalia,' as on coins of Pertinax and of Papianus, were only vows to perform the decennalia, if the emperor should reign ten

years; while 'primi decennales,' or 'secundi decennales,' imply these games to have been actually performed, and the emperor to have reigned ten or twenty years. On coins of Lucilla, Hadrian, Severus, Caracalla, and others, we find VOTA PVBLICA, with a sacrifice; showing that the vows were undertaken with that rite, as they were afterwards performed with solemn games and rejoicings. Coins of Constantine II. and of Constans often bear sic. x. sic. xx., to express the wishes of the people, that, as the emperors had happily reigned ten years, so they might reign twenty.

The following is a table which will greatly assist the student in deciding the country and æra of coins:—

I. ANCIENT GREEK COINS.—1. With one or more hollow indented marks on one side, and an impression in relief on the other, are those of Calcedon on the Hellespont, Lesbos, Abdera in Thrace, Acauchus in Macedon, and Ævina, or Ægium, in Achaia. This class continues from about 900 to 700 B. C. 2. With an indented square divided into segments, having a small figure in one of them; the rest blank, with a figure in relief on the obverse, are those of Syracuse, and other places adjacent. Continue from 700 to 600 B. C. 3. Coins hollow on the reverse, with figures in relief on the obverse, belong to Caulonia, Crotona, Metapontum, &c.; supposed by some to be a local coinage of Magna Græcia; but probably of equal antiquity with the former. 4. Coins in which a square die is used on one or both sides are those of Athens, Cyrene, Argos, &c.—Of Alexander I. and Archelaus I. of Macedon. Disused in the reign of the latter, about A. A. C. 420. 5. Complete coins, both in obverse and reverse, occur first in Sicily in the time of Gelo, about A. A. C. 491. 6. Coins of Alexander the Great and his successors. About the time of this hero the Greek coins began to attain perfection and beauty. It is remarkable that on the coins of this monarch his own portrait seldom occurs. After his death many coins bear his portrait. Trebellius Pollio informs us that some coins, particularly those of Alexander, used to be worn as amulets; and many of his medals are met with in cabinets bored seemingly with that intention. 7. Coins of the successors of Alexander.—Those of the Syrian monarchs almost equal the coins of Alexander himself in beauty. Those of Antiochus VI. are supposed to be the most perfect patterns of manly beauty any where to be met with. The Egyptian Ptolemies are somewhat inferior. 8. The coins of the Arsacids of Parthia, executed by Grecian artists, are worth notice. 9. The Greek imperial coins being such as have the head of an emperor or empress; such as have not these impressions being classed with the civic coins, though struck under the Roman power. None of the imperial coins occur in gold. Of silver there are those of Antioch, Tyre, Sidon, Tarsus, Berytus, Cæsarea. Egyptian silver coins of base metal. Syrian silver coins, which sometimes bear on the reverse the club of Hercules, or the Tyrian shell-fish. Those of Sidon bear the image of the goddess Astarte, or her chariot. Those of Cæsarea in

Cappadocia, are better work than the Syrian. Lycian coins of good workmanship: on the reverse two harps, and an owl sitting upon them. Silver coins of Gelon in Sarmatia, resembling the Syrian. The situation of this town is very much unknown. It seems to have been situated on the north of the Euxine Sea, where some Sarmatic or Sclavonic tribes were mingled with the Scythians or Goths. The Greek imperial brass coins are very numerous. A series of almost all the emperors may be had from those of Antioch, with a Latin legend on the obverse, and Greek on the reverse. Those of Bithynia and Phrygia are remarkable for good workmanship. The coins of Tarsus, remarkable for their curious views of objects, are almost in perspective. The Egyptian coins, from Augustus to Nero, are worse executed than afterwards. From Nero to Commodus they are often of admirable workmanship, and in a peculiar style, distinct both from the Greek and Roman. From the time of Commodus the Egyptian brass coins of the Roman period are likewise of excellent workmanship, especially in the time of Antoninus Pius.

II. ANCIENT ROMAN COINS.—1. *The consular coins*, called also the coins of families, and arranged alphabetically in cabinets, according to the names of the families which appear on them. They are,

Brass Coins.—These consist chiefly of large pieces, of rude workmanship, without any interesting imagery. They are generally kept in boxes apart by themselves. The *as* bears the head of Janus; the *semitis*, of Jupiter, with S; the *triens*, of Minerva, with four cyphers; the *quadrans*, of Hercules, with three cyphers; the *sextans*, of Mercury, with two cyphers; and the *uncia* bears the head of Rome, with one cypher. In all these pieces the prow of a ship is constantly the figure on the reverse, with very few exceptions. Sometimes, indeed, they have a shell, two heads of barley, a frog, an anchor, or a dog, on the reverse. About the time of Julius Cæsar both the obverses and the reverses of the coins began to be altered.

Silver.—Of this the *denarius* was the first and principal coin. It was stamped originally with X, denoting that the value was ten asses. On the reverse were Castor and Pollux, or a chariot of Victory. Afterwards the busts of various deities appear; and in the seventh century of Rome the portraits of illustrious persons deceased are met with: but till the time of Julius Cæsar no portrait of any living person is to be met with, Julius himself being the first who assumed that honor. The workmanship on the best and worst silver is much the same. The reverses are very curious, and point out many remarkable events in Roman history; but none of these occur till about a century before the Christian æra. The large *denarii*, with ROMA, are the most ancient; and some of these bear the Pelasgic A, not the Roman. The silver *sestertii* have a head of Mercury, with a caduceus on the reverse. The *quinarii* have always a head of Jupiter, with a Victory on the reverse.

Gold.—Most of these are of great value. Their number does not exceed 100; those of brass 200;

and of silver 2000. The aureus is the general gold coin; but two or three gold *semisses* of families likewise occur.

2. *Roman imperial coins*. Brass.—This is of three sizes; large, middle, and small. The first forms a most beautiful series, but very expensive. The various colors of the patina have the finest effect. It is the most important of all the Roman coins, and exceeds even the gold in value.

The middle brass is next in value to the former; and in it are many rare and curious coins, particularly interesting to Britons, as elucidating the history of the island.

The small brass series abounds also with curious coins. They are scarce till the time of Valerian and Gallienus, but very common afterwards. Mr. Pinkerton recommends, therefore, to form a series in silver as well as brass, as the cheapest of all the Roman coins. 'In this series,' says he, 'it is a common fault to arrange many coins which have been plated with gold or silver, the forgeries of ancient times, but which time has worn off, either wholly or in part. All real brass coins have the S. C. till the time of Gallienus; as the senate alone had the power of striking brass, while the emperor himself had that of gold and silver. When the S. C. therefore is wanting, the coin was certainly once plated; as, in general, the different type and fabric, being those of gold and silver, sufficiently show themselves. With Pertinax, A.D. 192, there is a temporary cessation of small brass; nor after him do any princes occur in that series till Valerian, A.D. 254, excepting Trajanus Decius, A.D. 250 only. After Valerian the series is continuous and common. The brass coinage gradually declined in size from the time of Severus; so that parts of the *as* could not be struck, or at least it was held unnecessary to strike them. Trajanus Decius attempted in vain to restore the coinage; and Valerian and Gallienus were forced to issue *denarii ærei* and small *assaria*. The series of large and of middle brass are of two fixed and known sizes; the former about that of our crown, the latter of the half crown: though after Severus they gradually lessen. But the small brass takes in all parts of the *as*; and every brass coin not larger than our shilling belongs to this series.

The *minimi*, indeed, or very smallest, it is proper to keep apart. The coins of Julius Cæsar in this size are of peculiarly fine workmanship. They bear his portrait reverse of Augustus, or the reverse has a crocodile, EGYPTO CAPTA. There are several with Marc Antony, and some with Cleopatra; but the more common pieces are those with only numerals on the obverse, which go to the length of XIII.; probably tickets for the baths. From the time of Nero to that of Vespasian no small brass occurs; but there are many of the latter, and of his son Titus; while Domitian has as many as Nero, and Domitia his wife almost as many. Succeeding emperors to Pertinax have also many brass coins; but from his time to that of Valerian there are no real small brass, excepting those of Trajanus Decius. After Gallienus there are many coins of this kind; and Mr. Pinkerton mentions one in Dr. Hunter's

cabinet of an unknown person named Nigrianus. The coin seems to have been struck at Carthage; and our author concludes that he was an African usurper, father to Nigrinianus.

Silver.—This series is very complete, and the cheapest of any, especially as the small brass becomes a fine supplement to it; the latter being had in plenty when the silver becomes scarce, and the silver being plentiful when the brass is scarce.

Gold.—The Roman imperial gold coins form a series of great beauty and perfection; but, on account of their great price, are beyond the purchase of private persons.

The colonial coins (speaking generally) occur only in brass; the colony of Nemausus being the only one allowed to coin silver. They begin in Spain with Julius Cæsar and Antony, and cease with Caligula, who took away the privilege of coinage from the Spanish colonies. The most beautiful are those of Corinth. The other remarkable colonial coins are those of Emerita, Ilice, Terraco, Cassandria, Babba, Berytus, Cæsarea, Petrà, Emisa, Heliopolis or Balbec, Ptolemais, Sidon, Tyre, Deultion, Diom, Troas, Rhesania, and Neapolis of Samaria, which bears a representation of Mount Gerizzim with the temple on it. On some of these coins we meet with fine representations of temples, triumphal arches, gods, goddesses, and illustrious persons. But coins with those representations are by no means common; the colonial coins till the time of Trajan bearing only a plough, or some other simple badge of a colony. Camelodunum is the only colony in Britain of which we have any coins.

The *minimi*.—This includes the smallest coins of all denominations; most of them do not exceed the size of a silver penny. No series of them was ever formed by any person, except the abbé Rothelin, whose collection passed to the queen of Spain. The reason of the scarcity of these small coins is probably their diminutive size.

Numbers of Roman coins are found in all countries once subject to that powerful people. Some have been met with in the Orkneys, and many in the most remote parts of Europe, Asia, and Africa, known to the ancients.

No *Indian* or *Chinese* coins are to be met with till a very late period; and then so rude as scarcely to be worth notice. Voltaire mentions a collection of ancient Chinese and Indian coins made by the emperor of China in 1706; but Pinkerton supposes it to have consisted only of the Greek and Roman money which had been introduced into these countries.

The *Hebrew* shekels, originally didrachms, but after the time of the Maccabees tetradrachms, are almost all forgeries of modern Jews, as well as the brass coins with Samaritan characters upon them. They have all a sprig upon one side and a vase on the other. The admission of one of them into a cabinet would almost be a disgrace to it.

Phœnician and *Punic* coins are very interesting on account of the great power and wealth of these nations: The alphabets have been cleared by their relation to the Hebrew and Syriac lan-

guages. The coins of *Palmyra* come under the same denomination with the former, Palmyra being a Syrian city.

The *Etruscan* coins have the characters of that nation, which have been explained by their affinity to the Pelasgic, or oldest Greek and Latin.

The *Spanish* coins are inscribed with two or three alphabets allied to the old Greek or Punic; but the inscriptions have not been sufficiently explained.

Gaulish coins.—These are numerous; but the most ancient have no legends; and even after the Greek letters were introduced into Gaul, by a colony at Marseilles, the legends are very difficult to be explained.

British coins.—From a passage in Cæsar's Commentaries it has been inferred, that the Britons used some sort of coins even in his time. Rude coins of copper very much mingled with tin are frequently found in England; which may probably be some of the ancient British money. They are of the size of a didrachm, the common form of the nummus aureus among the ancients. After the time of Cæsar coinage increased among the Britons; and there are many found of Cunobelinus, mentioned in the Roman History. Most of these have on one side CUNO, with an ear of wheat, a horse, a kind of head of Janus, or other symbol; and have frequently also the letters CAMV; supposed to mean Camelodunum. Sometimes the word TASCIA occurs; the meaning of which has never yet been explained.

The *coins of Japan* are thin plates of gold and silver, large and oval, stamped with little ornaments and characters. The only known ones of China are copper, about the size of a farthing, with a square hole through the middle, in order to their being strung for the convenience of enumeration or of carriage. They bear an inscription in Chinese, expressing the year of the prince's reign, without his name. It is said that Canghi, the emperor, who died in 1722, after a reign of sixty-one years, formed a complete cabinet of Chinese coins, and appointed a Mandarin to keep it. The coins of Tartary, posterior to Jenghis Khan, are rude, and generally present only inscriptions. In Thibet, Pegu, and Siam, the coins are various; but evidently of late origin, and generally bearing inscriptions on both sides. Such also are those of many smaller states in Eastern Asia. In the ancient India, where the Mahometan faith is predominant, the precept of Mahomet, which forbids the representation of any living creature has had a pernicious effect on the arts; and it is doubtful whether any Indian coins exist before the time of the Moguls. But some old coins have been found near Calcutta, of gold, silver, copper, and tin, all mingled in one base mixed metal. On one side they bear a warrior with a sword, and on the other a female idol. The later coins of India are well known, such as the pagoda, rupee, and cash (the most common copper), whence our word. All these are very thick, like the old Egyptian. On one remarkable set of rupees are represented the twelve signs, a lion on one of them, a bull on another, &c. &c. The Portuguese, English, French, and Dutch, sometimes struck coins in their settlements with Persian inscriptions on one

side and Latin on the other. Rupees and cash are known of Elizabeth, of Charles II., of the year 1730, and of other periods. The coins of Persia have continued on the Arabian model, even after the Arabian caliphs lost their dominion in that country, and bear on both sides pious inscriptions from the Koran. The Persian copper, however, has the sun and lion, the arms of Persia, on one side. Of Mamus, and some other petty kings in Arabia, we have coin during the imperial period of Rome. The brass coins of Haroun Al Raschid, the Charlemagne of Asia, and his contemporary, and of other powerful princes who resided at Bagdad, have, on the reverse, an Arabic inscription; the obverse is a transcript of any old Greek or Roman coin that fell in the way of the moneyer. This is often very perplexing to a tyro. The gold and silver coins have many inscriptions. The later Arabian coins, which are silver, bear the name and titles of the prince on one side, and some sentence from the Koran, &c. on the other. The more modern are in the shape of a fish-hook, with Arabic inscriptions. The coins of Turkey resemble those of Persia and Arabia, having merely inscriptions on both sides. The coins of Morocco, Fez, Tripoli, Algiers, &c., are upon the Mahometan plan of mere inscriptions.

Passing over Abyssinia, and the interior of Africa, as little known, and the civilised empires of America, Mexico on the north, and Peru on the south, where coinage was not practised, we proceed to the coins of Europe. In Italy, when the Roman empire in the west ceased with Romulus A.D. 476, the Gothic kings struck coins till Teias, the last of them, was conquered in 552 by Narses, the general of Justinian. Then the exarchs of Ravenna, viceroys for the Byzantine emperors, issued copper with FELIX RAVENNA, &c.; but the gold and silver of the Greek emperors sufficed for Italy. After Charlemagne, about the year 780, made a great revolution in Italy, there are coins of him struck in Rome and Milan. In the next century the modern coins of Italy begin with the silver pennies of different states. The papal coins originate with Hadrian I. 772—795, to whom Charlemagne gave leave to coin money. The silver pennies continued till a late period, with the name of the pope on the one side, and SCUS PETRUS on the other. On these coins there are rude portraits of some of the popes. Afterwards, when the pope ceased to have power in Rome, from Paschal II. till Benedict XI. in 1303, there are pennies of the Roman senate and people, bearing on one side Peter, ROMAN PRINCEPS, on the other Paul, SENAT. POPUL. Q. R. In the middle ages the chief bishops of Italy, France, and England, struck coins, as well as the pope. The first gold coin is of John XXII. 1316. The coins of Alexander VI., Julius II., and Leo X., are remarkably elegant.

Milan.—The coinage began with Charlemagne. The first coin of the family of Visconti occurs in 1330, under Azo. The set finishes with Louis XII.

Naples.—Coinage begins in 840 and 880, with duke Sergius and bishop Athanasius. The next coins are of Roger of Sicily, and Roger II. in 1130, William I. II. and Tancred. Naples and

Sicily were subdued in 1194 by the emperor of Germany; in 1255 Manfred appears; in 1266 Charles of Provence; and others till Joan in 1414: after which follow the house of Arragon, and later kings.

Venice begins in the tenth century. The first coins are silver pennies marked Veneci. Then follow the coins of Henrico Dandolo in 1192, of Ziani in 1205, &c. Gold was first coined at Venice in 1280, and copper in 1471; but the silver groats are as old as 1392.

Florence.—Silver was coined here in the twelfth century or before; but in 1252 the first gold coins struck in Europe after the eighth century made their appearance, and were named florins from the flower of the lily upon them. They were imitated by the popes, by France, and England. They have on one side St. John the Baptist standing, on the other a large fleurs de lis, and it is not doubted that the French fleur de lis took their origin from these coins. They weigh a drachm, and are no less than twenty-four carats fine, according to Italian writers, and are worth about twelve shillings.

Geneva first began to coin money in 1129, under the government of Conrad. Those of the dukes of Savoy began in the same century.

Aquileia.—Coins were issued from this city by the patriarchs from 1204 to 1440.

Ferrara.—Coins of the marquises from 1340.

French coins.—During the race of Clovis, from 490 till 751, the coins are chiefly gold trientes, with some solidi and semisses. The former are of good workmanship, with the heads of kings. The reverse has a cross with the name of the town where they were struck.

The coinage did not begin to improve till 1226 under St. Louis, when the groat appears. Its name in Italian is grossa, in French grosse, in English groat, or great coin; so called from its size in comparison with the penny; and it passed from Italy to France, to Germany, and to England. After the conquest of France by the English, base coins of many kinds were introduced; and in the year 1574, in the time of Henry III., copper was first introduced into the French coinage. Besides these, the other remarkable coins of France are, the blancs or billon groats, first issued in 1348; the ecus à la couronne, or crowns of gold, so called from the crown on one side, and begun by Charles VI. in 1384; those of Ann of Bretagne in 1498: the teston, or piece with the king's head, of Louis XII.; the Henri of Henry II., with Gaul sitting in armour, and a victory in her hand. And in 1642 Louis XIV. takes the title of Cataloniæ princeps. The first louis d'or made its appearance in 1640.

Spanish coins.—The most early series of these consist almost entirely of trientes finely done. On one side they have the head of the king with his name; and on the other a cross, with the name of the town, commonly in Bética, or the south part of Spain, where there were very many Roman colonies, and which was fertile to a proverb. The Moorsque coins of Spain, like those of the rest of the Mahometan states, present us only with inscriptions on both sides. Indeed the Mahometan religion, by its absolute refusal to allow the representation of any living

creature, has prevented the progress of coinage in any degree throughout those regions which it has overspread. The inscriptions on the ancient Spanish coins are in the Cusic or old Arabic characters.

Germany.—The emperors and many of the cities, particularly those called Hanse Towns, issued money; and many of the coins issued by the cities were superior in elegance even to those issued by the emperors.

Denmark.—Here the coinage begins with Canute the Great in 1014. The pieces are at first extremely rude, ornamented only with rings and Runic characters. These are succeeded by copper pieces, some of which have a cross, others a pastoral staff on one side, with the letter A on the other. Later coins have strokes *||||*, &c., all round them; but those of Harold, Hardicanute, and Magnus Bonus, in 1041, are of neat workmanship, and have the portraits of the princes at half-length. The coins of Nicholas or Neil, as he is called by the Danes, are rude, as well as those of Waldemar I. and the celebrated Margaret. In 1376 Olaf caused money to be struck with a grinning full face, with a crowned O upon the other side. Silver was first coined in Denmark by Philippa queen of Eric, and daughter to Henry IV. of England.

Sweden.—The coinage of this kingdom began in 818 under Biorno, on the plan of Charlemagne. These coins are marked with a cross. Next follow those of Olaf, in 1019, which were struck on the English model. During the time that Sweden was subject to Denmark, or miserably harassed by the Danes, the coins of both kingdoms were the same; but after the time of Gustavus Vasa many elegant pieces appear. In 1634 dollars were coined, with the portrait of Gustavus Adolphus, who was killed two years before: on the reverse they have the arms of Sweden, with the chemical marks of mercury and sulphur. In 1716, 1717, and 1718, Charles XII., being in extreme want of money, issued small copper coins with Saturn, Jupiter, Mars, &c., upon them to go for dollars; and on account of this scheme, baron Goertz, the suggester of it, was brought to the block.

Norway.—The coins of this country begin with Olaf in 1006; after which time there are various coins of other princes; but copper was not coined till the year 1343. Besides the coins already mentioned, there are ecclesiastic coins of France, Germany, Denmark, Sweden, Norway, &c. Those of Denmark and Sweden are numerous; but the Norwegian coins of this denomination are rare. Mr. Pinkerton describes a silver one in his possession as having arms and a mitre, with the inscription on one side *SANCTUS OLAVS REX NORVEG*; on the reverse *OLAVS DEI GRA. ARCEP. NID'SEN*, meaning *NIDROSIENSIS*, or archbishop of Nidros, now Drontheim.

Bohemia.—The coinage of this kingdom appears at a very early date, viz. in the year 909, under duke Boleslaus I. These coins are followed by others of Boleslaus II. and Emma his wife in 970; of Boleslaus III. in 1002; Jaromir in 1020; Udalrich in 1030, and other princes. The bracteate money of Ottocar I. was coined in 1197.

Poland.—The coinage of this country is nearly

as ancient as that of Bohemia. The coins are on the German model, but no particular account of them has been published.

Russia.—None of the Russian money appears to be more ancient than the thirteenth century; the first are the kopecks or silver pennies, which have upon them rude figures of animals on one side, and a man standing with a bow or spear on the other. There are likewise coins of Moscow, struck by Aristoteles the architect in 1482, the roubles or dollars and their halves. There are some of the impostor Demetrius in 1605, which are very scarce.

Prussia.—The first Prussian coins were struck at Culm by the Teutonic knights in 1230. They were silver pennies, and upon the German plan. In the next century were struck shillings, groats, and schots; the last were the largest, and are extremely rare. They have the Prussian shield, an eagle surmounting a cross, with a rose-shaped border, *MONETA DOMINORUM PRUSSIE*: on the reverse is a cross fleurie, within a border of a similar kind, having the inscription *HONOR MAGISTRI JUSTITIAM DILIGIT*.—Gold coins were struck in the same century. In the time of Copernicus the money was so debased that twelve or thirteen marks were worth but one of pure silver.

ENGLAND. The English coins are of various kinds.

Heptarchic coin are only of two sorts, viz. the *skeata* or penny of silver, and the *styca* of copper. Few of the pennies appear till after the year 700; though some are met with which bear the name of Ethelbert I. king of Kent, as old as 560. At first they had only rude figures of serpents; but in later times legends were likewise added. Most of these pennies have pagan symbols upon them. The *styca* was only coined in Northumberland, and was a very small piece about the value of half a farthing.

Coins of the chief monarchs of England.—The coins of the chief monarchs form almost a complete series from the time of Egbert to Edgar. The only chief monarch of whom there are no coins is Ethelbald, who reigned in 857. Most of these coins bear rude portraits: but the reverses are sometimes curious and interesting. Some have views of cathedrals and other buildings; particularly one of Edward the Elder in 900, which has the cathedral of York with three rows of windows, round arched, as the other Saxon and Norman buildings; the Gothic arch being quite unknown till after the twelfth century. Some coins of Anlaf king of Northumberland have the famous raven, the Danish ensign; and those of other princes have frequently very curious reverses.

Ecclesiastic coins appear of the archbishops of Canterbury, Wulfurd, in 804, Ceolnoth in 830, and Plegmund in 889.

Coins of the kings.—The silver penny, which had begun during the heptarchy, continued to be the general coin after the kingdom had been united under one head; and extends in a continued series from Egbert almost to the present reign. The only kings wanting are Edmund Ironside, Richard I., and John. At first the penny weighed twenty-two grains and a half; but towards the close of the reign of Edward III. it

fell to eighteen grains; and in that of Edward IV. to eleven. In the time of Edward VI. it was diminished to eight grains; and in queen Elizabeth's reign to 7½; at which it still continues.

Halfpennies and farthings were first struck in silver by Edward I. in 1280; the former continued to the time of the commonwealth, but the latter ceased with Edward VI. The groat was introduced by Edward III. in 1354, the half-groat or twopence is of the same date.

Shillings were first coined by Henry VII. in 1503. At first it was called testoon, from the teste, tete, or head of the king upon it: the name shilling being derived from the German schelling; under which appellations coins had been struck at Hamburg in 1407. The crown was first coined in its present form by Henry VIII. Formerly it had appeared only in gold, whence the phrase of crowns of gold; though these indeed were the largest gold coins known for a long time in France and other countries on the continent being worth about ten shillings sterling. They had their name from the crown stamped on one side, and were first coined by Charles VI. in 1384, and continued till the time of Louis XIV. The halfcrown, sixpence, and threepence, were coined by Edward VI. In 1558 queen Elizabeth coined three half-penny, and in 1561 three farthing pieces; but they were discontinued in 1582. From the year 1601 to the present time the coins of England remain the same.

Gold was coined in England by Henry III. in 1257; the piece was called a gold penny, and was larger than the silver one; and the execution is by no means bad for the time. The series of gold coinage, however, commences properly from Edward III. In 1344 this monarch first struck florins, in imitation of those in Italy; and it is remarkable, that though these coins, at the time they were first issued, bore only six shillings value, they are now intrinsically worth nineteen shillings; so much has the value of gold increased since that time. The half and quarter florin were struck at the same time, but only the last has been found. The florin, however, being inconvenient, gave place to the noble of 6s. 8d. value, and exactly half a mark. The latter had its name from being a limited sum in accounts; and was eight ounces in weight, two-thirds of the money pound. It is sometimes also called selibra, as being one half of the commercial pound of sixteen ounces. The noble had its name from the nobility of the metal; the gold of which it was coined being of the finest sort. Sometimes it is called rose noble, from both sides being impaled in an undulating circle. It continued with the half and quarter noble to be the only gold coin till the angels of Edward IV. appeared in 1465. These had their name from being stamped with the image of Michael and the dragon. The angelites of 3s. 4d. value were substituted in their place. In 1527 Henry VIII. added to the gold coins the crown and half crown at their present value; and the same year he gave sovereigns of £1 2s. 6d. and ryals of 11s. 3d. angels at 7s. 6d. and nobles at their old value of 6s. 8d. In 1546 he caused sovereigns to be coined of the value of £1, and half sovereigns in proportion. His gold crown

is about the size of our shilling, and the half crown of sixpence, but thin. All his coins, however, gold as well as silver, are much debased; and it was not without much labor and trouble that Edward VI. brought it back to its former standard. On the union of the two crowns, James gave the sovereign the name of unite; the value continuing of £1 as before. He coined also rose-ryals of £1 10s. value, spur-ryals of 15s., angels of 10s., and angelets of 5s. Under the commonwealth, the sovereign got the name of the twenty-shilling piece, and continued current till the coinage of guineas. These were so called from their being coined of Guinea gold, and were at first only to go for £1, though by a universal but tacit consent they always passed for £1 1s. Half-guineas, double guineas, and five guinea pieces, were also coined during the same reign. Quarter guineas were coined by George I., but they were found so troublesome, on account of their small size, that they were stopped within a year or two when received at the bank of England. The guinea rose to £1 1s. 6d., and continued to increase in value till 1696, when it was as high as £1 10s.; but after the recoinage, in 1697 and 1698, it fell by degrees, and at 1717 was at its old standard of £1 1s., and at that time silver was fixed at its present standard value, viz. one to fifteen and a half in weight.

Though the first money coined in Britain was copper, yet, except the Northumbrian stycas, no copper coin was found in England from the time of the Saxon conquest till the year 1672. An aversion to a copper coinage, it seems, was prevalent throughout the nation; and queen Elizabeth, who without hesitation used base money for Ireland, yet scrupled at coining copper for England. This want of small coin occasioned such an increase of private tokens for halfpennies and farthings that it became a serious object to government; and in 1594 a copper coinage was seriously thought of. This year a small copper coin was struck, about the size of a silver twopence, with the queen's monogram on one side, and a rose on the other; the running legend on both sides being THE PLEDGE OF A HALFPENNY. Of this there are patterns both in copper and silver, but both of them soon fell into disuse. On the 19th of May, 1613, king James, by royal proclamation, issued farthing tokens. They are generally of the same size with the two-pence, with two sceptres in saltier surmounted with a crown, and a harp upon the other; with an intention, as it would seem, that if they were refused in England they might pass in Ireland. In 1635 Charles I. coined those with the rose instead of the harp; but the circulation of these was entirely stopped by the vast number of counterfeits which appeared, and by the king's death in 1648. After this the private tokens began again to circulate, till put a stop to by the coinage of farthings in 1670. The workmanship of the tokens is quite contemptible. In 1672 the halfpence as well as the farthings, which had been struck two years before, began to circulate. They were of pure Swedish copper, the dyes engraved by Roettier; and they continued till the year 1684, when some disputes arose about the copper lately

obtained from the English mines. Tin farthings were coined with a stud of copper in the centre, and inscribed round the edge as the crown pieces, with *NUMMORUM FAMULUS*, 1685 or 1686. In 1685 halfpence of the same kind were coined; and the tin coinage continued till the year 1692, to the value of more than £65,000; but next year the tin was all called in by government, and the copper coinage recommenced. The farthings of queen Anne are all trial pieces, excepting those of 1714, the last year of her reign. 'They are,' says Mr. Pinkerton, 'of exquisite workmanship, exceeding most copper coins either ancient or modern, and will do honor to the engraver, Mr. Croker, to the end of time. The one whose reverse is Peace in a car, *PAX MISSA PER ORBEM*, is the most esteemed; and next to it the *BRITANNIA* under a portal. The other halfpence and farthings are less valuable.'

Scotland.—Silver pennies of Alexander I., who reigned in 1107, are believed to exist; and there certainly are some of Alexander II. in 1214. There are likewise coins of David I. in 1124; but perhaps none of Malcolm IV. his successor, whose reign was very short. There are many coins of William I. in 1165, and a large hoard of his pennies was found at Inverness in 1780.

The money of Scotland continued to be of the same value with that of England, till the country was drained by the vast ransom of David II., after which it became necessary to reduce its size; and so much did this diminution affect England, that Edward III. found himself obliged to lessen the English coin also. The diminution of the Scottish coin, however, continued still to go on until it became impracticable to keep par with that of England. In the first year of Robert III. it passed only for half its nominal value in England; in 1393 Richard II. ordered it only to go for the weight of the genuine metal it contained. In 1600 it had sunk to such a degree as to pass only for a twelfth part of the English money, and continued at that low ebb till the coinage of Scotland was entirely cancelled by the union of the two kingdoms.

Of silver coins we have only pennies till the year 1293, when, Edward I. having coined halfpence and farthings, Alexander III. of Scotland coined also halfpence, of which we have a few, but no farthings are to be met with; but there are silver farthings of Robert I. and David II. The latter introduced the groat and half groat, which completed the set of Scottish silver. It continued unaltered till the time of queen Mary, when they all ceased to be coined in silver, on account of the high price of that metal. In 1553 shillings were first coined, with the bust of the queen on one side, and the arms of France and Scotland on the other. The silver crown was first coined in 1565, which went for thirty shillings Scots; less pieces of twenty shillings and ten shillings have likewise been struck; and marks of silver, worth three shillings and four pence English, were also coined about the same time. These coins have upon them the marks xxx. xx. x. to denote their value. They are commonly called Cruckstone dollars, from the palm-trees upon them, mistaken for a remarkable *yew* at Cruckstone near Glasgow, where Henry

Darnley resided. It is described, however, in the act as a palm, with a 'shell padoc' (a tortoise) crawling up. This alludes to Darnley's marriage with the queen, as the motto from Propertius, *DAT GLORIA VIREM*, also implies. The motto *NEMO ME IMPUNE LACESSET* first appears on the Scottish coins in 1578, and the invention is given to the celebrated Buchanan. In 1582 the crown of an ounce weight went for forty shillings Scots, and was accordingly marked XL. In 1397 the mark was L., the Scottish money being then only one-tenth of the English: the mark was LX. in 1601, the value being then reduced to one-twelfth, at which it has ever since continued. In the time of Charles I. half-marks, forty and twenty penny-pieces were coined. In 1675 the Scottish dollars first appeared, in value fifty-six shillings Scots, with halves and quarters of proportional value. In 1686 James VII. coined sixty, forty, twenty, ten, and five shilling pieces; but only those of forty and ten shillings are known, with these numbers under the bust. At the union of the kingdoms all the Scottish coins were called in, and recoined at Edinburgh, with the mark £ under the bust to distinguish it; since which there has been no coinage in Scotland. The Scottish silver coins are in general equal, if not superior, in the workmanship to the English.

Gold was first issued by Robert II., about thirty years after Edward III. of England had coined the same metal in that country. The pieces were at first called St. Andrew's, from the figure of that tutelar saint upon the cross, and who appears on the obverse with the arms of Scotland, and on the reverse a lion in a shield. The lion was another name for the largest gold coin in Scotland, from the arms of the kingdom upon it. The next was the unicorn under James III., which were followed by the bonnet-pieces of James V. These last are of admirable workmanship, being almost equal to the ancient coins in this respect. In imitation of the French, the monarch we speak of diminished the size of the coin without lessening its weight; an improvement not adopted by the English for a whole century. The last gold coin in Scotland was the pistole and half pistole, of twelve and six pounds Scots. These coins have the sun under the head. The gold coins of Scotland fell in the same proportion with the silver.

The copper coinage of Scotland is of more early date than that of England. It was preceded by money of billon, or copper washed with silver, called black money. James III. first coined black farthings in 1466; and this is recorded by historians as one of his greatest faults. This kind of coinage, however, continued as late as the reign of James VI. In his time the true copper coinage began; but, as the value of Scottish money had now declined almost to the utmost, the pieces suddenly assumed a form almost resembling that of the French coins. The bodle, so called from Bothwell the mintmaster, being equal in size to the liard, and worth two pennies Scottish, was struck. The billon coin, formerly called *bas piece*, and worth six pennies Scots, was now coined in copper, and termed the *bawbee*. Thus it corresponded with the French

half sol and English halfpenny, the Scots penny being now equivalent to the French denier. Some pieces named Achesons were coined by James VI. in 1582, when the Scottish money was to the English as one to eight; but, on its being still farther reduced, they went for eight pennies, a third more than the value of the bawbee. Besides these there were the hardie and plack, the former being worth three and the latter four pennies Scots. This coinage continued through the reigns of Charles I. and II.; but Scottish coins of the former are perhaps the scarcest of any.

Ireland.—The first coins introduced into this kingdom seem to have been those of the Danes, and which have only a number of strokes round them instead of letters. In the tenth century, however, this coinage had been considerably improved; and in 930 and 994 there are pennies struck in Dublin, with the inscription on DVFLI or DYFLI, Dufin or Dyfin being the Danish name of that city. There are likewise coins of the Irish princes themselves, and of the English monarchs, struck in Ireland as early as the ninth century; and it is asserted by some that Ireland, even in these days, had been conquered by England; of which, indeed, these coins seem to be a proof. None of the Irish coins of Henry II. are to be met with; but we have some of the coins of John; and from his time to that of Henry V. the Irish coins are known by a triangle enclosing the king's head, which appears also upon the coins of other nations at this period. The harp does not appear upon the Irish coins till the time of Henry VIII. Till the time of this monarch the English and Irish coins are the same; but the same debasement of the coin which at that time took place in England extended also to Ireland; but in 1601 copper halfpence and farthings were coined also for this kingdom. These circulated in Ireland when James VI. issued his farthing tokens of copper, the latter being of two sizes, that if they failed in England they might be sent to Ireland as pennies and halfpence. In 1635 a mint was established in Dublin by Charles I.; but it was stopped by the Irish massacre, and the many disturbances which followed; since which time the scheme has not been resumed. After the massacre, St. Patrick's halfpence and farthings were coined by the Papists, bearing the legends *FLOREAT REX*, and on the reverse *ECCE GREX*; on the farthing *QUIESCAT PLEBS*. Copper tokens were struck by towns and tradesmen, as in England and Scotland. In 1680 halfpence and farthings were issued by authority, with the harp and date. In 1689 James II., having invaded Ireland, instituted a mint, and coined shillings and half crowns of all the refuse metal he could find, particularly some brass guns were employed, whence the coinage is commonly called gun money. Even this metal, however, soon became so scarce, that a diminution in its size is quite apparent from June 1689 to July 1690; and, as the month of their mintage is marked upon them, this decrease is easily perceived. In March, 1690, pennies of lead mixed with tin were issued; and on the 15th of June, the same year, crowns of white metal were coined; but these are now very scarce. In 1722 the patent for

coining halfpence and farthings was given to William Wood which excited such discontent in Ireland. From the small size allowed by the patent to these pieces, it was supposed that the patentee would have gained £60,000, but as he caused them to be struck of a size still smaller, his gains were estimated at £100,000. See COINS.

The first MODERN MEDALS of gold were those of David II. of Scotland, struck between the years 1330 and 1370. Only two of them now exist; one in the collection of Mr. Barker of Birmingham, and the other in that of Dr. Hunter. In 1478 there is a medal of James III., sent to the shrine of St. Amboise in France. It is described as of two inches and a third in diameter; the weight nearly two ounces; having on the obverse a beardless king, with long hair, sitting on a throne, holding in one hand a naked sword, in the other a shield, with the Scottish arms. On the borders of the canopy above the throne is an inscription in Gothic letters, *IN MI DEFFEN*, being corrupt French for in my defence; a common motto in the Scottish arms. Above the canopy is *VILLA BERWICI*: the reverse bears St. Andrew and his cross, *SALVUM FAC POPULUM TUUM, DOMINE*. There is also a medal of James IV. in the collar of St. Michael, having on the reverse a Doric pillar surmounted by a young Janus, standing on a hill, beyond which is the sea, and land on either side. This, however, is by some suspected to be a forgery.

The most remarkable Scottish medals are those of the unfortunate Mary. The first is properly French, having been issued at her coronation as queen of France, along with her husband king Francis II. On the obverse of this piece there are portraits of Francis and Mary, face to face, with three legends around them, the outermost containing their titles; the middle one the following sentence: *HORA NONA DOMINUS J. H. S. EXPIRAVIT BELLI CLAMANS*; the innermost the name of the city (Paris). On the reverse are the arms of France and Scotland. Fine testoons were also coined upon the same plan, and are now so rare that Dr. Hunter gave ten guineas for one he has in his collection. The same portraits appear on the fine crown of Mary and Henry, in 1565, which is so rare as to be esteemed a medal of the highest value; and Mr. Pinkerton imagines that if brought to a sale it would bring forty or fifty guineas.

Another remarkable medal of Mary represents her full-faced, and weeping, with the inscription, *O GOD, GRANT PATIENCE, IN THAT I SUFFER VRANG*. The reverse has, in the centre, *QUO CAN COMPARE WITH ME IN GRIEF? I DIE AND DAR NOCHT SEEK RELIEF*; with this legend around, *HOURT NOT THE* (figure of a heart) *QUHAIS JOY THOU ART*. There are also many counters of this unfortunate princess, being thin silver pieces of the size of a shilling. 'They all appear,' says Mr. Pinkerton, 'to have been done in France by Mary's direction, who was fond of devices. Her cruel captivity could not debar her from intercourse with her friends in France, who must with pleasure have executed her orders, as affording her a little consolation.'

The coronation medal of Charles I., struck at

Edinburgh for his inauguration, June 18th 1663, is remarkable as being the only one ever coined of Scottish gold, and the first in Britain struck with a legend on the edge. With respect to the workmanship, it is inferior to Simon's. Of these medals only three are known to exist, of which one is in the Museum. It is not uncommon in silver; in which case it sometimes wants the legend on the edge.

2. *Italian medals.* These appear in the fifteenth century, and from that time successively in most European countries. Vittore Pisano, a painter of Verona, is celebrated as the restorer of the art; but it remains to be accounted for how the medals of king David already mentioned came to exist so long before. Mr. Pinkerton considers this artist rather as an inventor than a restorer, his medals having no resemblance to the ancient coins, as being large, and all cast. They were first modelled in wax, then a mould taken from the model in fine sand and other ingredients. After a good cast was procured, it was touched up, and made a model for the rest. These medals of Pisano are almost always inscribed *OPUS PISANI PICTORIS*. The portraits of a great number of illustrious men were done by him in this manner; and in the British Museum is a large brass medal of Pisano by himself.—Other artists were Boldu, Marescotto, Matthæus de Pastus, Sperandes, Misaldone, &c. Towards the end of the century, however, the medals began to assume a more elegant appearance; and the papal ones are not only the most elegant, but the most ancient series of all the modern medals. The improvement began in the reign of Alexander VI., so famous for his own crimes and those of his nephew Cæsar Borgia. His successors, Julius II., Leo X., Hadrian VI., and Clement VII., had many of their medals designed by Raphael, Julio Romano, and other eminent painters, and the engraving executed by artists of equal merit. Among these were the celebrated Cellini, and the noted Paduan forgers of Roman coins, Cavino and Bassiano. In 1644 Cormanni, a medallic artist, was imprisoned on account of a piece which represented the pope upon one side and Olympia Maidalchina, the relation of his holiness, on the other. The unfortunate Cormanni poisoned himself. About this time the family of the Hamerani, originally from Germany, began to engrave the papal medals; which they did with surprising merit for several generations. Each of the daughters did a fine medal, as we are informed by Venuti.

Besides the papal medals there are many issued by the various states of Italy. There are medals of Frederick II. of Sicily in 1501, of several Venetian generals in 1509, of Alfonso duke of Ferrara in 1511, and of the celebrated Andrew Doria in 1528.

3. *French medals.* Till the reign of Louis XIV. the medals of this country are neither fine nor numerous; but this monarch exceeds all modern princes in this way. Many of his pieces are well designed and executed, though objectionable on account of their falsehood.

4. *Danish medals.* These appear of Christian II. in 1516; of Frederic and Sophia in 1532; of Frederic I. and Christian III., in bonnets worn

in the sixteenth century. The elephant of the house of Oldenburg is frequent upon Danish medals.

5. *Swedish medals.* These begin with Gustavus Vasa; and several of Christina are likewise to be met with. There are also some curious ones of Charles XII.

6. *Dutch medals.* These begin in 1566; and many of them are remarkable for maps and plans, which must be very interesting to posterity. 'Had the Greeks and Romans (says Mr. Pinkerton) given us maps and plans, what a fine system of ancient geography and topography a cabinet of medals must have been!'

7. *Medals of Spain, Portugal, and Germany.* The Spanish medals began with Gonsalo in 1503, many of which are curious and interesting. Under Charles V. there are many curious Spanish medals; but those of Germany begin with Frederick in 1453. They are extremely numerous; as we may easily suppose from the greatness of the empire, and the various states which compose it. There is a famous medal of Sebastian king of Portugal, famous for his unfortunate expedition into Africa in 1578; with his bust, full face, and three quarters in length. On the reverse is a shell-fish in the sea, with the moon and seven stars, bearing the inscription *SERENA FAVENT CAUSÆ*. There is also a curious lozenge-shaped coin of the same, with the arms of Portugal, and the king's name and title: on the reverse is a cross with the inscription *IN HOC SIGNO VINCES*, 1578.

8. *Satiric medals.* These began almost as soon as the knowledge of the art of coining medals was revived. They seem to have been almost unknown to the ancients. One indeed of the emperor Gallienus is supposed to have been satiric. It has on the front the emperor's bust, with the inscription *GALLIENÆ AVG.*, the reverse is *Peace in a car, PAX UBIQUE*; but this has been proved to be only a blundered coin. Some other ancient medals, however, are not liable to this objection. The first modern satiric medal published was that of Frederick king of Sicily in 1501, against his antagonist Ferdinand king of Spain. It has on one side the head of Ferdinand, with the inscription *FERDINANDUS R. AR. VETUS VULPES ORBIS*; on the reverse a wolf carrying off a sheep, *JUVVM MEVM SVAVE EST, ET ORVS MEVM LEVE*. Many others have been struck, of which the wit would now perhaps be difficult to be found out: but of all nations the Dutch have most distinguished themselves in this way; and paid very dear for their conduct, as they brought upon themselves, by one or two satiric medals, the whole power of France under Louis XIV.

9. *English medals.* The first of these is in the duke of Devonshire's collection. It is of a very large size, and done on the plan of the early Italian medals. It has on the reverse the arms of Kendal, with the inscription *TEMPORE OBSIDIONIS TURCORUM. MCCCCLXXX*. On the other side is a portrait with *IO. KENDAL RHODI TURCUPERLIERUS*. It was found last century in Knarborough forest; but Mr. Pinkerton has no doubt of its having been done in Italy. The next is that of Henry VIII. in 1545, and is of gold, larger than the crown-piece, with the king's head upon the ob-

verse, and three legends within each other, including his titles, &c. The reverse contains two inscriptions, declaring him to be the head of the church; the one in Hebrew, the other in Greek. It was imitated exactly by Edward VI., whose coronation medal is the first we have. There are two medals of Philip and Mary, whose execution is tolerably good; but those of Elizabeth are very poor. There are good medals of James I. and his queen; with a fine one of Charles I. and Henrietta, though the workmanship is much inferior to the antique. There are many good medals of Charles, with various devices upon their reverses. Under the commonwealth the celebrated Simon produced medals which are deservedly reckoned the most admirable pieces of modern workmanship. There are many good medals of Charles II., James II., and William III. Some are also found of James after his abdication. Some fine gold, silver, and copper medals, were issued in the time of queen Anne; the two last affording a series of all the great actions of the duke of Marlborough. About the year 1740 a series of medals was engraved in London by Daffier, a native of Geneva, containing all the kings of England; being thirty-six in number. They are done upon fine copper, and executed with great taste. There are besides many medals of private persons in England; so that it may justly be said that this country, for medals, exceeds almost every other in Europe.

To this account of modern coins and medals we shall add that of another set called siege-pieces, and which were issued during the time of a siege in cases of urgent necessity. These were formed of any kind of metal; sometimes of no metal: and Patin mentions a remarkable one struck at Leyden in 1574, when the place was besieged by the Spaniards. It was of thick paper or pasteboard, having a lion rampant, with this inscription, *PVGNO PRO PATRIA*, 1574; and on the reverse *LVGDVNVM BATAVORVM*. There are various siege-pieces of Charles I., both in gold and silver, some of the latter being of the value of 20s.

The nummi bracteati are a species of modern coins, somewhat between counters and money; and have their name from the word *bractea* a spangle or thin bit of metal. They are commonly little thin plates of silver, stamped as would seem with wooden dies upon one side only, with the rude impression of various figures and inscriptions. Most of them are ecclesiastic, and were struck in Germany, Switzerland, Denmark, Sweden, Norway, and a few in Poland. They continued to be in use in Germany till the end of the fifteenth century; and some are still used in Switzerland.

SECT. V.—OF THE PRESERVATION OF COINS AND MEDALS.

We now come to consider what it is that distinguishes one medal from another, and why some are so highly prized more than others. This, in general, besides its genuineness, consists in the high degree of preservation in which it is. This, by Mr. Pinkerton, is called the conservation of medals, and is by him regarded as good

and as perfect. In this, he says, that a true judge is so nice, that he will reject even the rarest coins if in the least defaced either in the figures or legend. Some, however, are obliged to content themselves with those which are a little rubbed, while those of superior taste and abilities have in their cabinets only such as are in the very state in which they came from the mint; and such, he says, are the cabinets of Sir Robert Austin and Mr. Walpole, of Roman silver, at Strawberryhill. It is absolutely necessary, however, that a coin be in what is called good preservation: which in the Greek or Roman emperors, and the colonial coins, is supposed to be when the legends can be read with some difficulty; but when the conservation is perfect, and the coin just as it came from the mint, even the most common coins are valuable.

The fine rust, like varnish, which covers the surface of brass and copper coins, is found to be the best preserver of them; and is brought on by lying in a certain kind of soil. Gold cannot be contaminated but by iron mold, which happens when the coin lies in a soil impregnated with iron; but silver is susceptible of various kinds of rust, principally green and red; both of which yield to vinegar. In gold and silver coins the rust must be removed, as being prejudicial; but in brass and copper it is preservative and ornamental; a circumstance taken notice of by the ancients. 'This fine rust,' says Mr. Pinkerton, 'which is indeed a natural varnish not imitable by the art of man, is sometimes a delicate blue, like that of a turquoise; sometimes of a bronze brown, equal to that observable in ancient statues of bronze, and so highly prized; and sometimes of an exquisite green, a little on the azure hue, which last is the most beautiful of all. It is also found of a fine purple or olive, and of a cream color or pale yellow: which last is exquisite, and shows the impression to much advantage, as paper of cream color, used in all great foreign presses, does copperplates and printing. The Neapolitan patina (the rust in question) is of a light green; and when free from excrescence or blemish is very beautiful. Sometimes the purple patina gleams through an upper coat of another color, with as fine effect as a variegated silk or gem. In a few instances a rust of a deeper green is found; and it is sometimes spotted with the red or bronze shade, which gives it quite the appearance of the East Indian stone called the blood stone. These rusts are all, when the real product of time, as hard as the metal itself, and preserve it much better than any artificial varnish could have done; concealing at the same time not the most minute particle of the impression of the coin.'

The value of medals is lowered when any of the letters of the legend are misplaced; as a suspicion of forgery is thus induced. Such is the case with many of those of Claudius Gothicus. The same, or even greater diminution in value, takes place in such coins as have not been well fixed in the dye, which has occasioned their slipping under the strokes of the hammer, and thus made a double or treble image. Many coins of this kind are found in which the one side is perfectly

well formed, but the other blundered in the manner just mentioned. Another blemish, but of smaller moment, and which to some may be rather a recommendation, is when the workmen, through inattention, have put another coin into the dye without taking out the former. Thus the coin is convex on one side and concave on the other, having the same figure upon both its sides.

The medals said by the judges in this science to be countermarked are very rare, and highly valued. They have a small stamp impressed upon them, in some a head, in others a few letters, such as *AUG: N. PROBUS, &c.*, which marks are supposed to imply an alteration in the value of the coin; as was the case with the countermarked coins of Henry VIII. and queen Mary of Scotland. Some have a small hole through them, sometimes with a little ring fastened in it, having been used as ornaments; but this makes no alteration in their value. Neither is it any diminution in the value of a coin that it is split at the edges: for coins of undoubted antiquity have often been found in this state, the cause of which has already been explained. On the contrary, this cracking is generally considered as a great merit; but Mr. Pinkerton suspects that one of these cracked coins has given rise to an error with respect to the wife of Carausius, who reigned for some time in Britain. The inscription is read *ORIUNA AUG.*: and there is a crack in the medal just before the *O* of *oriuna*. Without this crack Mr. Pinkerton supposes it would have been read *Fortuna Aug.*

Some particular soils have the property of giving silver a yellow color as if it had been gilt. It naturally acquires a black color through time, which any sulphurous vapor will bring on in a few minutes. From its being so susceptible of injuries, it was always mixed by the ancients with much alloy, in order to harden it. Hence the impressions of the ancient silver coins remain perfect to this day, while those of the modern coins are obliterated in a few years. On this account Mr. Pinkerton expresses a wish that modern states would mix a much greater proportion of alloy in their silver coins than they usually do. As gold admits of no rust, except that from iron above-mentioned, the coins of this metal are generally in perfect conservation, and fresh as from the mint.

To clean gold coins from this rust it is best to steep them in aquafortis, which, though a very powerful solvent of other metals, has no effect upon gold. Silver may be cleansed by steeping for a day or two in vinegar, but more effectually by boiling in water with three parts of tartar and one of sea-salt; on both these metals, however, the rust is always in spots, and never forms an entire incrustation as on brass or copper. The coins of these two metals must never be cleansed, as they would thus be rendered full of small holes eaten by the rust. Sometimes, however, they are found so totally obscured with rust that nothing can be discovered upon them; in which case it is best to clear them with a graver; but it may also be done by boiling them for twenty-four hours in water with three parts of tartar and one of alum; not sea-salt as in silver coins.

SECT. VI.—OF THE DISTINCTION BETWEEN GENUINE MEDALS AND COUNTERFEITS.

The most difficult and most important thing in the whole science of numismatography is the method of distinguishing the true from the counterfeit. The value put upon ancient coins made the forgery of them almost coeval with the science itself; and, as no laws inflict a punishment upon such forgers, men of great genius and abilities have undertaken the trade.

Forgeries are more conspicuous among the Roman medals than any other kind of coins; but we are not to look upon all these as the work of modern artists. On the contrary, we are assured that many of them were fabricated in the times of the Romans themselves, some of them being even held in more estimation than the genuine coins themselves, on account of their being plated, and otherwise executed in a manner to which modern forgers could never attain. Even the ancients held some of these counterfeits in such estimation, that Pliny informs us there were frequently many true *denarii* given for one false one.

Of the Roman consular coins not very many have ever been forged. The celebrated silver *denarius* of Brutus, with the cap of liberty and two daggers, is the chief instance of a consular coin of which a counterfeit is known. But it is easily rejected by this mark: in the true coin the cap of liberty is below the guard or hilt of the daggers; in the false the top of it rises above that hilt.

The imperial series of medals is the grand object of modern medallist forgeries; and the deception was at first extended to the most eminent writers upon the subject. The counterfeits are by Mr. Pinkerton divided into six classes:

I. Such as are known to be imitations, but valued on account of the artists by whom they are executed. In this class the medals of *Calvin*, the *Paduan*, rank highest; the others being so numerous that a complete series of imperial medals of almost every kind, nay almost of every medallion, may be formed from among them.

The *Paduan* forgeries may be distinguished from those of inferior artists by the following marks:—1. The former are seldom thinner than the ancient, which others almost always are. 2. They very seldom appear as worn or damaged, but the others very frequently, especially in the reverse, and legend of the reverse, which sometimes, as in forged *Othos*, appear as half consumed by time. 3. The letters in moulds taken from the antique coins have the rudeness of antiquity. 4. False varnish is commonly light green or black, and shines too much or too little. 5. The sides of forged coins are frequently quite smooth, and undistinguishable from the ancient, though to accomplish this requires but little art. 6. Counterfeit medals are frequently as irregular in their form as the genuine; but the *Paduan* are generally circular; though false coins have often little pieces cut off, in perfect imitation of the genuine. 7. In cast coins the letters do not go sharp down into the metal, and have no fixed outline; their minute angles, as well as those of the drapery, are commonly filled up, and have

not the sharpness of the genuine kind. Where the letters or figures are faint, the coin is greatly to be suspected.

The letters form the great criterion of medals, the ancient being very rude, but the modern otherwise; the reason of which, according to Cellini, is, that the ancients engraved all their matrices with the graver or burin, while the modern forgers strike theirs with a punch.

According to Vico, the false patina is green, black, russet-brown, gray, and iron-color. The trial of brass coins with the tongue is not to be despised; for, if modern, the patina tastes bitter or pungent, while if ancient it is quite tasteless.

Mr. Pinkerton informs us that all medallions from Julius Cæsar to Adrian are much to be suspected of forgery; the true medals of the first fourteen emperors being exceedingly valuable, and to be found only in the cabinets of princes.

II. The second class of counterfeit medals contains those cast from moulds taken from the Paduan forgeries, and others done by eminent masters. These are sometimes more difficult to be discovered than the former, because in casting them they can give any degree of thickness they please; and, filling the small sand holes with mastic, they retouch the letters with a graver, and cover the whole with varnish. The instructions already given for a former class, however, are also useful for those of the second, with this addition, that medals of this class are generally lighter than the genuine, because fire rarifies the metal in some degree, while that which is struck is rather condensed by the strokes.

III. *Medals cast in moulds from an antique.*—The directions given for discovering the two former deceptions hold good also in this.

IV. *Ancient medals retouched and altered.*—This is a class of counterfeits more difficult to be discovered than any other. The art (says Mr. Pinkerton) exerted in this class is astonishing; and a connoisseur is the less apt to suspect it, because the coins themselves are in fact ancient. The Italian artists alter the portraits, the reverses, and the inscriptions themselves, in a surprising manner. This fraud is distinguished by the false varnish which sometimes marks it; but, above all, by the letters of the legend, which are always altered. Though this be sometimes done with an artifice almost miraculous, yet most commonly the characters straggle, are disunited, and not in a line. In counterfeits of this kind, sometimes the obverse is not touched, but the reverse made hollow, and filled with mastic colored like the coin, and engraven with such device and legend as was most likely to bring a great price; others are only retouched in some minute parts, by which, however, the value of the coin is much diminished.

V. *Medals impressed with new devices or soldered.*—In the first article of this class the reverses have been totally filed off, and new ones impressed with a dye and hammer. The difference of fabrication in the face or reverse will be discovered at the first glance by any person of skill.

The soldered medals consist of two halves belonging to different medals, sawed through

the middle and then joined with solder. This mode of counterfeiting is common in silver and brass coins. Medals which have a portrait on each side, and which are generally valuable, are the most liable to a suspicion of this fraud. To a very nice eye the minute ring of solder is always visible; and, upon inserting a graver, the fabrication falls into halves.

VI. *Plated medals, or those which have clefts.*—It has been already remarked that many true medals are cracked in the edges, owing to the repeated strokes of the hammer, and the little degree of ductility which the metal possesses. This the forgers attempt to imitate by a file; but it is easy to distinguish betwixt the natural and artificial cleft by means of a small needle. The natural cleft is wide at the extremity, and appears to have a kind of almost imperceptible filaments; the edges of the crack corresponding with each other in a manner which no art can imitate.

The plated medals which have been forged in ancient times were long supposed to be capable of resisting every effort of modern imitation; but of late years some ingenious rogues (says Mr. Pinkerton) thought of piercing false medals of silver with a red hot needle, which gave a blackness to the inside of the coin, and made it appear plated to an injudicious eye. This fraud is easily distinguished by scraping the inside of the metal. It is, however, very difficult to distinguish the forgeries of rude money when not cast, and our author gives no other direction than to consult a skilful medallist. Indeed, notwithstanding all the directions already given, this seems to be a resource which cannot by any means safely be neglected.

Forgeries of modern coins and medals are almost as numerous as of the ancient.

SECT. VII.—OF THE VALUE OF ANCIENT COINS AND MEDALS.

All ancient coins and medals, though equally genuine, are not equally valuable. In medals, as well as in every thing else, the scarcity of a coin stamps a value upon it which cannot otherwise be derived from its intrinsic worth. There are four or five degrees of rarity reckoned up; the highest of which is called unique. The cause is generally ascribed to the smallness of number thrown off originally, or to their having been called in, and recoinced in another form.

Sometimes the rarest coins lose their value, and become common. This our author ascribes to the high price given for them, which tempts the possessors to bring them to market; but chiefly to the discovering of hoards of them. The former cause took place with queen Anne's farthings, some of which formerly sold at five guineas; nay, according to the newspapers, one of them was, several years ago, sold for no less than £960!! The latter cause took place with the coins of Canute the Great, king of England and Denmark, which were very rare till a hoard of them was discovered in the Orkneys. As such discoveries, however, produce a temporary plenty, so, when they are dispersed, the scarcity returns, while some of the common coins become rare, merely through neglect.

As there are many more copper coins of Greek cities to be met with than silver, the latter are much more valued; but the reverse is the case with those of the Grecian monarchs. All the Greek civic coins of silver are very rare, excepting those of Athens, Corinth, Messana, Dyrrhachium, Massilia, Syracuse, and some others. Of the Greek monarchic coins, the most rare are the tetradrachms of the kings of Syria, the Ptolemies, the kings of Macedon and Bithynia, excepting those of Alexander the Great and Lysimachus. Those of the kings of Cappadocia are of a small size, and hardly to be met with. Of those of Numidia and Mauritania, the coins of Juba the father are common; but those of the son and nephew, Ptolemy, are scarce. Coins of the kings of Sicily, Parthia, and Judea, are rare; the last very much so. We meet with no coins of Arabia and Comagene except in brass; those of the kings of Bosphorus are in electrum, and a few in brass, but all of them rare; as are also those of Philatenis, king of Pergamus, and of the kings of Pontus. In 1777 a coin of Mithridates sold for £26 5s. Didrachms of all kings and cities are scarce, excepting those of Corinth and her colonies; but the gold coins of Philip II. of Macedon, Alexander the Great, and Lysimachus, are common. The silver tetradrachms of all kings bear a very high price. The didrachm of Alexander the Great is one of the scarcest of the small silver Greek coins; some of the other princes are not uncommon.

The copper money of the Greek monarchs in general is scarce, but that of Hiero I. of Syracuse is uncommonly plentiful, as well as that of several of the Ptolemies of Egypt. Many of the copper civic coins of Greece, too, are also common. They are almost all of those sizes which are called small brass in the Roman series; the middle size is scarce. The largest, prior to the Roman emperors, are extremely rare. The common Grecian civic coins in small brass sell at from 3d. to 1s. 6d. according to their preservation. Very many cities, however, of which not above one or two coins are known to be extant, and those of brass bring far higher prices. 'The want of a few cities, however,' says Mr. Pinkerton, 'is not thought to injure a collection; as indeed new names are discovered every year, so that no assortment can be perfect. To this it is owing that the rarity of the Grecian civic coins is not much attended to.' The Greek copper coins are for the most part scarcer than the silver, except the Syro-Grecian, which are common, and almost all of the size called small brass. They ought (says Pinkerton) to bear a high price; but the metal and similarity to the copper civic coins, which are common, keep their actual price moderate, if the seller is not well instructed, and the buyer able and willing to pay the price of rarity.

The gold coins of Philip II. and Alexander the Great, being very common, bear but from 5s. to 10s. above their intrinsic value; but those of the other princes, being rare, sell at from £3 to £30 each, or even more.

The tetradrachms are the dearest of the silver monarchic money, selling at from 5s. to 10s., and, if very rare, from £3 to £30 each. Half of

these prices may be given for the drachmas, and the coins of the other denominations in proportion.

The gold coins of Carthage, Cyrene, and Syracuse, are worth about double their intrinsic value as metal; but the other gold civic coins are worth from £5 to £30 each. The only gold coins of Athens certainly known to exist are two purchased a few years ago by his majesty, one of which remains in the royal cabinet, and the other was given by the queen to Dr. Hunter. There was another in the British Museum, but it is suspected not to be genuine. Dr. Hunter's coin then, if sold, would draw the highest price perhaps ever given for a coin.

The silver coins of Syria, Dyrrhachium, Massilia, Athens, and a few other states, are common; the drachmas and coins of less size are worth about 5s. each; the didrachma, tetradrachms, &c., from 5s. to 10s., according to their size and beauty; the largest, *ceteris paribus*, being most valuable. The tetradrachms of cities, whose coins are common, are worth from 7s. 6d. to 21s.; but it is impossible to put a value upon the rare civic coins: ten guineas have been given for a single one.

The most rare of the consular Roman coins are those restored by Trajan. Of the others, the gold consular coins are the most rare, and the silver the most common; excepting the coin of Brutus with the cap of liberty, and a few others. Some of the Roman imperial coins are very scarce, particularly those of Otho in brass; nor does his portrait occur at all on any coin struck at Rome, owing to the shortness of his reign. His head upon the brass coins of Egypt and Antioch is very badly executed, as well as all the other imperial coins of Greek cities. The best likeness is on his gold and silver coins; the latter of which are common. The Greek and Egyptian coins are all of small or middling sizes, and have various reverses; those of Antioch, as well as most of its other imperial coins, have Latin legends. They have no other reverses but S.C. in a wreath, excepting in one or two of the large and middle brass, where the inscriptions are Greek. Latin coins of Otho in brass, with figures on the reverse, are reckoned false, though in the cabinet of D'Ennery at Paris there was an Otho in middle brass, restored by Titus, which was esteemed genuine by connoisseurs.

The leaden coins of Rome are very rare: most of them are pieces struck or cast on occasion of the Saturnalia; others are tickets for festivals and exhibitions. The tickets for theatres were made of lead, as were also the contorniate, perpetual tickets, like the English silver tickets for the opera. Leaden medallions are also found below the foundations of pillars and other public buildings, to perpetuate the memory of the founders. From the time of Augustus leaden seals were also used. A work of Tignorini on this subject, entitled *Piombi Antiochi*, is much recommended by Mr. Pinkerton.

The Roman coins, which have been blundered in the manner formerly mentioned, are very rare, and undeservedly valued by connoisseurs. The blunders in the legends of these coins, which are probably the mere effects of accidents, have been

so far mistaken by some medallists, as to have given life to imaginary emperors who never existed. A coin of Faustina, which has on the reverse SOUSTI. S. C. puzzled all the German antiquaries, till Klotz ridiculed their investigations by the following humorous interpretation: *Sine omni utilitate sectamini tantas ineptias!*

As to the Roman imperial coins, some of those which belong to the emperors whose coins are numerous, may yet be extremely valuable by having uncommon reverses. Mr. Pinkerton points out one of Augustus, with the legend C. MARIUS TROGVS, which is worth three guineas, though the silver coins of Augustus in general are not worth above 1s. In like manner the common gold coins of Trajan are not worth above 20s., while those with BASILICA ULPIA, FORVM TRAJANI, DIVI NERVA ET TRAJANVS, PATER, DIVI NERVA ET PLATINA AVG. PRO-FECTIO AVG. REGNA ASSIGNATA, REX PARTHVS, and some others, draw from £3 to £6. The ticket medals belonging to the senate are worth from 3s. to 10s.

The ancient Roman asses are worth from 2s. to £2, according to the singularity of their devices. The name of *weights*, given to the ancient Roman asses, is (says Mr. Pinkerton) exceedingly improper, as the Romans had weights of lead and brass sides, without the least appearance of a portrait upon them. These denote the weight by the number of knobs, and have likewise small *fleur-de-lis* engraved upon them. Whenever, therefore (he adds) we meet with a piece of metal stamped on both sides, with busts and figures, we may lay it down as a certain rule that it is a *coin*; but when slightly ornamented, and marked on one side only, we may with equal certainty conclude it to be a *weight*.

Consular gold coins are worth from 20s. to £5. Pompey with his sons £21, and the two Bruti £25. The silver coins are universally worth from 1s. to 2s. 6d. excepting that of the cap of liberty, and a few others, which, if genuine, will bring from 10s. to £5. The consular copper bears an equal price with the silver, but is more rare; the consular silver coins restored by Trajan are worth 20s. each.

Of the coins of other nations those of Hilderich, king of the Vandals, in silver, are worth 10s., the small brass of Athanaric 5s.; the gold of Theodoric 40s.; the second brass of Theodahat 5s.; the second brass of Badueta, being rare, are worth 10s.; the third brass 3s. each. Coins and medals with unknown characters are always scarce and dear.

Ancient British coins are very rare, and worth from 10s. to two guineas each, sometimes much more. The heptarchic coins of England are generally rare, except those called *Stycas*, which are very common, as well as those of Burgred, king of Mercia. The coins of Alfred the Great with his bust are scarce, and his other money much more so. Those of Hardycanute are so rare that it was denied they had any existence, till Mr. Pinkerton informed the public that there are three in the British Museum, upon all of which the name HARTECNUT is quite legible. Saxon pennies of the heptarchy are rare, and worth from 10s. to £10, according to their scar-

city and preservation. Coins of Edward the Confessor are pretty plentiful; others are rare, and worth from 10s. to two guineas; while two of Hardicanute are worth no less than ten guineas each.

The coins of the English monarchs after the conquest are common, except those of Richard I. and John, not one of which is to be met with; though there are some French coins of Richard I., and Irish ones of king John. 'Leake,' says Mr. Pinkerton, 'made a strange blunder in ascribing coins of different kings with two faces, and otherwise spoiled in the stamping, to Richard I.; in which, as usual, he has been followed by a misled number.' The gold medals of Henry VIII. in 1545, and the coronation medals of Edward VI., are worth £20 each; the Mary of Trezzo £3; Simon's head of Thurloe, in gold, is worth £12; his oval medal in gold, upon Blake's naval victory, is worth £30; and his trial piece, says Pinkerton, if sold, would bring a still higher price. The medals of queen Anne, which are intrinsically worth two guineas and a half, sell at £3 each; the silver, of the size of a crown, at 10s.; and the copper from 5s. to 10s. Daffier's copper pieces sell at from 2s. to 5s., and a few still higher.

The English coins struck in Ireland are of much the same value with those struck in England; but the St. Patrick's halfpence and farthings are rather scarce, and the rare crown of white metal is worth £4. The gun money of James II. and most other Irish coins are very common.

The Scottish gold coins sell higher than the English, but the others are on a par. Coins of Alexander I. and II. are rather scarce, but those of Alexander III. are pretty plentiful. Those of John Baliol are rare, and none of Edward Baliol are to be found. The shilling of queen Mary with her bust is rare, and sells for no less than £30; the half for £3; and the royal for five guineas. The French testoon of Francis and Mary brings ten guineas; and the Scottish one of Mary and Henry would bring £50; as would also the medal of James IV. The coronation medal of Francis and Mary is worth £20. Briot's coronation medal sold, in 1755, for only two guineas at Dr. Mead's sale, but would now bring £20 if sold according to its rarity.

SECT. VIII.—OF THE ARRANGEMENT OF COINS AND MEDALS.

One of the principal uses of medals being the elucidation of ancient history, the arrangement of medals is the first thing that occurs in the formation of a cabinet. The most ancient medals extant are those of Alexander I. of Macedon, who began to reign about 501 years before Christ. The series ought, therefore, to begin with him, and to be succeeded by the medals of Sicily, Caria, Cyprus, Heraclea, and Pontus. Then follow Egypt, Syria, the Cimmerian Bosphorus, Thrace, Bithynia, Parthia, Armenia, Damascus, Cappadocia, Paphlagonia, Pergamus, Galatia, Cilicia, Sparta, Pæonia, Epirus, Illyricum, Gaul, and the Alps, including the space of time from Alexander the Great to the birth of Christ, which is to be accounted the third medal-

lie series of ancient monarchs. The last series goes down to the fourth century, including some of the monarchs of Thrace, Bosphorus, and Parthia, with those of Comagene, Edessa or Osroene, Mauritania, and Judea. A most distinct series is formed by the Roman emperors, from Julius Cæsar to the destruction of Rome by the Goths; nay, for a much longer period, were it not that towards the latter part of it the coins became so barbarous as to destroy the beauty of the collection. Many series may be formed of modern potentates.

Medals likewise afford a good number of portraits of illustrious men; but they cannot easily be arranged in chronological order, so that a series of them is not to be expected. It is likewise vain to attempt the formation of a series of gods and goddesses to be found on ancient coins. Mr. Pinkerton thinks it much better to arrange them under the several cities or kings whose names they bear. A collection of the portraits of illustrious men may likewise be formed from medals of modern date.

ABBREVIATIONS used in the LEGENDS of COINS and MEDALS; after Mr. PINKERTON.

GREEK NUMERALS.

| | | | | | |
|--------|----|--------|-----|--------|------|
| Α | 1. | Ι | 10. | Ρ | 100. |
| Β | 2. | Κ | 20. | Σ or C | 200. |
| Γ | 3. | Λ | 30. | Τ | 300. |
| Δ | 4. | Μ | 40. | Υ | 400. |
| Ε | 5. | Ν | 50. | Φ | 500. |
| ϵ or ϛ | 6. | Ξ | 60. | Χ | 600. |
| Ζ | 7. | Ο | 70. | Ψ | 700. |
| Η | 8. | Π | 80. | Ω | 800. |
| Θ | 9. | q or q | 90. | q | 900. |

Examples.—I is 10: add Α to Ι, ΙΑ makes 11; so ΙΒ, 12; ΙΓ, 13, &c. Κ is 20, ΚΑ, 21, &c. ΠΙΑ makes 111. The English word AIR marks the grand initial numerals. On coins the numerals are often placed in retrograde order; which makes no difference in the value, as every letter is appropriated to its number. Thus ΤΑΙ or ΙΑΤ imply the same, 333. But this advantage, being unknown to the Roman numerals and Arabic cyphers, is apt to puzzle the beginner.

ROMAN COINS.

A. AULUS: in the exergue it implies the first mint, as ANT. A. coined at Antioch in the first mint. A. A. A. F. F. Auro, Argent, Ære, Flando, Feriundo. A. or AN. Annus. A. A. Apollo Augusti. A. F. A. N. Auli filius, Auli nepos. ABN. Abnepos. ACT. Actiascus, or Actium. AD. FRV. EMV. Ad fruges emundas. ADIAB. Adiabenicus. ADOP. Adoptatus. ADO. Adquisita. ADV. Adventus. AED. Aedes. AED. F. Edilitia potestate. AED. S. Aedes sacre. AED. CVR. Edilis Curulis. AED. PL. Edilis Plebis. ABL. Ælius. AEM. or AIMIL. Æmilium.

ÆT. Eternitas. AFR. Africa, or Africanus. ALBIN. Albinus. ALIM. ITAL. Alimenta Italia. ANN. AVG. Annona Augusti. A. N. F. F. Annun Novum Faustum Felicem. ANIC. Anicius. ANN. DCCCLXIII. NAT. VRB. P. CIR. con. Anno 864 Natali Urbis Populo Circenses constituti. ANT. AVG. Antonius Augur. ANT. Antonius, or Antoninus. AP. Appius. A. P. F. Argentio Publico Feriundo. A POP. FRVG. AC. A Populo Fruges Acceptæ. AQ. or AQL. Aquilius. AQUA MAR. Aqua Martia. ARAB. ADQ. Arabia Adquisita. ARR. Arrius. AVG. Augur, Augustus, Augusta. AVG. D. F. Augustus Divi Filius. AVGO. Two Augusti. AVGGO. Three Augusti. AVR. or AVREL. Aurelius.

B. The mark of the second mint in any city. BON. EVENT. Bonus Eventus. B. R. P. NAT. Bono Reipublicæ Nato. BRIT. Britannicus. BRVT. Brutus.

C. Caius, Colonia. C. A. Cæsarea Augusta. C. CÆ. or CÆS. Cæsar. CÆSS. Cæsares. CARTH. Carthage. CEN. Censor. CENS. P. Censor Perpetuus. CEST. Cestius, or Cestianus. CIR. con. Note. Of these the drachma, didrachma, were of silver; the rest, for the most part, of brass. The other parts, as tridrachm, triobolus, &c., were sometimes coined.

Note also, the drachma is here, with the generality of authors, supposed equal to the denarius: though there is reason to believe the drachma was somewhat the weightier. See DRACHMA and DENARIUS.

(Sterling.) £. s. d.

The Grecian gold coin was the stater aureus, weighing two Attic drachms, or half of the stater argenteus; and exchanging usually for twenty-five Attic drachms of silver; in our money 0 16 1 $\frac{1}{2}$.

According to our proportion of gold to silver 1 0 9

There were likewise the stater Cyzicenus, exchanging for twenty-eight Attic drachms, or 0 18 1
 Stater Philippicus, and stater Alexandrinus, of the same value.
 Stater Daricus, according to Josephus, worth fifty Attic drachms, or 1 12 3½
 Stater Croesus, of the same value.

NUMITOR, the son of Procas, king of Alba, and the brother of Amulius. Procas, before his death, made him joint-heir with Amulius to the Alban crown, on condition of their reigning annually by turns; but Amulius, on getting possession of the throne, excluded Numitor, whose son Lansus he put to death, and obliged Ilia, otherwise called Rhea Sylvia, Numitor's only daughter, to become a vestal. This princess, becoming pregnant, declared that she was with child by the god Mars; and afterwards brought forth Remus and Romulus, who at length killed Amulius and restored Numitor to the throne, A. A. C. 754. See *ROME*.

NUMMARY, *adj.* Lat. *nummus*. Relating to money.

The money drachma in process of time decreased; but all the while the ponderal drachma continued the same, just as our ponderal libra remains as it was, though the *nummery* hath much decreased.

Arbuthnot on Coins.

NUMSKULL, *n. s.* } Numb (dull, torpid),
 NUMSKULLED, *adj.* } and skull. A stupid fellow; a dolt; the skull of such a fellow: dull, doltish.

They have talked like *numskulls*. *Arbuthnot.*
 Hocus has saved that clod-pated, *numskulled*, ninnyhammer of yours from ruin, and all his family.

Arbuthnot.

Or toes and fingers, in this case,
 Of *Numskulls* self should take the place. *Prior.*

NUN, *n. s.* } Sax. *nun*; Teut. *nun*; Dan. and
 NUNNERY. } Fr. *nonore*. A woman secluded from the world by a religious vow: nunnery is the abode of women thus secluded.

My daughters
 Shall all be praying *nuns*, not weeping queens.

Shakespeare.

A devout *nun* had vowed to take some young child, and bestow her whole life; and utmost industry, to bring it up in strict piety.

Hammond.

put your sister into a *nunnery*, with a strict command not to see you, for fear you should have wrought upon her to have taken the habit. *Dryden.*
 The most blooming toast in the island might have been a *nun*. *Addison.*

Every shepherd was undone,
 To see her cloistered like a *nun*.

Swift's Miscellanies.

NUN. See MONASTERY, and MONK. That there were females in the ancient Christian church who made public profession of virginity, before the monastic life was known, appears from the works of Cyprian and Tertullian. These, for distinction's sake, are sometimes called ecclesiastical virgins, and were commonly enrolled in the canon or matricula of the church. They differed from the monastic virgins chiefly in this, that they lived privately in their father's houses, whereas the others lived in communities; but their profession of virginity was not so strict as to make it criminal in them to marry afterwards, if they thought fit. The consecration of virgins was usually performed publicly in the church by the bishop. The virgin made a public profession of her resolution, and then the bishop put upon her the accustomed habit of sacred virgins. One part of this habit was a veil, called *sacrum velamen*; another was a mitre or coronet worn upon the head. At present, when a woman is to be made a nun, the habit, veil, and ring, of the candidate are carried to the altar; and she herself, accompanied by her nearest relations, is conducted to the bishop, who, after mass and an anthem (the subject of which is, 'that she ought to have her lamp lighted, because the bridegroom is coming to meet her'), pronounces the benediction: then she rises up, and the bishop consecrates the new habit, sprinkling it with holy water. When the candidate has put on her religious habit, she presents herself before the bishop, and sings on her knees, *Ancilla Christi sum*, &c.; then she receives the veil, and afterwards the ring, by which she is married to Christ, and lastly, the crown of virginity. When she is crowned, an anathema is denounced against all who shall attempt to make her break her vows. In the more barbarous times the nunneries often afforded protection and support to otherwise destitute and unprotected females, and were almost the only seminaries for the instruction of the sex. But they were also ready instruments of tyranny in the hands of avarice or of superstition, and many were thus immured for life to atone for a father's sins, or facilitate the transmission of the family estate.

NUN, NOON, or WEDINOOON, a region of Morocco, south of the high range of the Atlas, which renders its subjection and revenues extremely partial and precarious. The soil is neither so fertile as that of the other districts of Morocco, nor so barren as that of the immense deserts which extend on the south towards Soudan and Tombuctoo. Gum, wax, and ostrich feathers, are the only articles of export: the inhabitants, however, carry on a considerable and lucrative trade with Central Africa. A large amount of gold-dust is imported thence into this country; and Nun forms a general depot for the merchandise between Soudan and Mogodger. But the whole extent of its coast, from Agadeer

to Cape Bojador, does not afford a single harbour, and only two roads for shipping. The consequence is that European vessels, when driven upon these shores, have repeatedly suffered dreadful shipwreck. The character of the inhabitants is that of the most cruel barbarians: they not only seize the property of a vessel, but treat the mariners as slaves. Jackson calculates them at 300,000.

NUN'CHION, *n. s.* From *Noon*, which see, and *Teut. essin*, food, says Mr. Thomson. A portion of food taken between meals.

Laying by their swords and truncheons,
They took their breakfasts or their *nunchions*.

Hudibras.

NUN'CIO, *n. s.* } *Ital. nuncio*; *Lat. nun-*
NUN'CIATURE, *n. s.* } *cius*. A messenger or
ambassador; and particularly an envoy from
the pope: nunciature is his office.

She will attend it better in thy youth,
Than in a *nuncio* of more graye aspect. *Shakespeare.*

They honoured the *nuncios* of the spring; and
the Rhodians had a solemn song to welcome in the
swallow. *Browne.*

This man was honoured with the character of
nuncio to the Venetians. *Atterbury.*

NUNCIO, or **NUNTIO**,* an ambassador from
the pope to some Catholic prince, state, or con-
gress. The word *nuncio* has the same import
with ambassador; but is restrained in its use to
the ambassadors of the papal see alone, as that
of *internuncio* is to their envoys extraordinary.

NUNDYDROOG, a celebrated fortress and
country of Hindostan, in the province of Mysore.
The former is built on the summit of a
rock, about 1700 feet high, three-fourths of its
circumference being inaccessible. Our forces
took it by storm in 1791, after a three weeks'
siege. It stands in long. 77° 53'E., and lat. 13°
22' N.

NUNIA, a village of Irak, Arabia, distinguished
as being on the site of the ancient Nineveh.
Its history after it ceased to be the seat of
empire is almost unknown; and in the time of
Adrian it was completely destroyed. A city was
afterwards erected on the spot, bearing the name
of Ninus; and in Mr. Kinneir's opinion it is the
ruins of that city, and not of the ancient Nineveh,
that are now visible. They consist of a rampart
and fosse, forming an oblong square, not exceeding
four miles in compass. The wall is on an
average twenty feet high; but there is no appearance
of stones or rubbish of any kind.

NUNJENGODE, a town of the south of India,
in the Mysore, and standing on the south bank
of the Cubany River. It is inhabited chiefly by
brahmins, who are supported by a celebrated
and handsome pagoda, to which immense numbers
resort to make their annual offering. This temple
is very ancient, and kept in good repair. Long. 76° 50' E.,
lat. 12° 1' N.

NUPTIAL, *adj.* } *Fr. nuptial*; *Lat. nuptia-*
NUPTIALS, *n. s.* } *lis, nuptie*. Pertaining or
relating to marriage; constituting or performed
in marriage: *nuptials* is a word used only in the
plural (except by Shakespeare) for the marriage
ceremony.

Confirm that amity
With *nuptial* knot, if thou vouchsafe to grant
Bona to England's king. *Shakespeare.*

Lift up your countenance, as 'twere the day
Of celebration of that *nuptial*, which
We two have sworn shall come. *Id.*

Because propagation of families proceedeth from
the *nuptial* copulation, I desired to know of him
what laws and customs they had concerning marriage.
Beacon.

Whoever will partake of God's secrets, must pare
off whatsoever is amiss, not eat of this sacrifice with
a defiled head, nor come to this feast without a *nuptial*
garment. *Taylor.*

Then all in heat
They light the *nuptial* torch. *Milton's Paradise Lost.*
Let our eternal peace be sealed by this,
With the first ardour of a *nuptial* kiss. *Dryden.*

This is the triumph of the *nuptial* day,
My better *nuptials*, which in spite of fate,
For ever join me to my dear Morat. *Id.*

NUREMBURG, the former capital of Franconia,
and once a free city of the German empire, is
now a large and handsome town, included in the
Bavarian dominions. It is distinguished by its
manufactures of maps, prints, mathematical
and musical instruments, curious clock-work,
and several articles in iron, steel, ivory, wood,
and alabaster: there is also a celebrated school
for painting. Here gunpowder is said to have
been first invented, by Berthold Schwartz, a
monk. Martin Behem, to whom the discovery
of America has been ascribed, was also born
here; and Albert Durer, the famous engraver
on wood.

Nuremburg is included in the province or
circle of Rezat, and stands in a wide, sandy, but
well-cultivated plain, on the river Pegnitz, a
large but not navigable stream, which, flowing
from east to west, divides it into two nearly
equal parts. That on the north of the river is
called the Sebald side; the other, on the south,
the Laurence side: each deriving its name from
a principal church. The town is surrounded
with an old weak wall and ditch, with round
towers: it is entered by eight gates, and its
circumference is full three miles. The form of
the town is nearly a square; and several of the
streets are wide, but for the most part they are
both crooked and irregular. The houses are
generally of stone.

Of the public edifices the chief are the fort
called Reichsfeste, the occasional residence of
the emperors of the middle ages, but now used
as a granary: the council-house, built in 1619,
a fine old structure; and the church of St. Sebald.
The public library is remarkable for its MSS.
and early editions of books. The church of St.
Ægidius, rebuilt in 1718, has elegant columns,
and a beautiful altar-piece by Van Dyke. The
regalia and imperial jewels of a remote age were
long preserved in a church adjoining the river.
Nuremburg has also public warehouses for merchandise,
and public fountains. In former times it was
noted for the extent of its funds, for the relief
of the poor and for education. It has still an
alms-office, founding hospital, and house of correction.

The establishment of the burgrave of Nuremburg
took place in 1060; and the purchase of the city
rights by the inhabitants from the emperors in
1427. Its trade soon received from Venice a
strong impulse; and it shared with Augs-

buy the exchange of the spiceries, silks, drugs, and other articles of the south, in return for the bulky commodities of the north. But its chief traffic and grand consequence lay at this early period in its manufactures, this having been four centuries ago a noted place for all kinds of fine hardware. Paper was also made here at an early date; and it has long been famous for its extensive bookselling and printing establishments. It is fifty-eight miles E. S. E. of Wurzburg, and 100 north by west of Munich.

NURSE, *n. s. & v. a.* *Fr. nourrice, nourrir.*

NURSER, *n. s.*

NURSERY,

NURSING,

son; hence, an old woman; state of being nursed: to nurse is to nourish or bring up a child; to feed; maintain; tend or cherish in sickness or weakness; pamper; fondle: nursery is the act, office, or place of nursing, and is also applied to a place appropriated to the rearing of young trees: a nursling is one under or just come from a nurse's care; a fondling.

Shall I call a nurse of the Hebrew women, that she may nurse the child. *Exodus ii. 7.*

Thy daughters shall be nursed at thy side.

Isaiah lx. 4.

I was nursed in swaddling cloaths with cares.

Wisdom vii. 4.

This keeping of cows is of itself a very idle life, and a fit nursery for a thief. *Spenser on Ireland.*

Then was she held in sovereign dignity, And made the nursling of nobility. *Spenser.*

Never master had,

A page so kind, so duteous, diligent, So fast, so nurse-like. *Shakespeare. Cymbeline.*

I' the swathing cloaths, the other from their nursery

Were stolen. *Id.*

One Mrs. Quickly, which is in the manner of his nurse, or his dry nurse, or his cook. *Shakespeare.*

Rome, the nurse of judgment, Invited by your noble self hath sent

One general tongue unto us. *Id. Henry VIII.*

I loved her most, and thought to set my rest On her kind nursery. *Id. Ling Lear.*

See where he lies, inhearsed in the arms Of the most bloody nurse of his arms.

Shakespeare.

Unnatural curiosity has taught all women, but the beggar, to find out nurses, which necessity only ought to commend. *Raleigh.*

You see before you the spectacle of a Plantagenet, who hath been carried from the nursery to the sanctuary, from the sanctuary to the direful prison, from the prison to the hand of the cruel tormentor, and from that hand to the wide wilderness; for so the world hath been to me. *Bacon.*

Your nursery of stocks ought to be in a more barren ground than the ground is whereunto you remove them. *Id.*

And what is strength, but an effect of youth, which if time nurse, how can it ever cease? *Davies.*

Can wedlock know so great a curse, As putting husbands out to nurse? *Cleveland.*

If thou repentest truly, pluck up sin by the roots, take away its principle, strangle its nurse, and destroy every thing that can foment it.

Jeremy Taylor.

Our monarchs were acknowledged here, That their churches nursing fathers were.

Donham.

She went forth among her fruits and flowers, To visit how they prospered, bud and bloom Her nursery: they at her coming sprung, And touched by her fair tendance gladlier grew.

Milton.

I was his nursling once, and choice delight, His destined from the womb. *Milton's Agonistes.*

Put into your breeding pond three melters for one spawner; but if into a nurse pond or feeding pond, then no care is to be taken. *Walton.*

A nursery erects its head, Where queens are formed and future heroes bred; Where unfledged actors learn to laugh and cry.

Dryden.

In their tender nonage, while they spread Their springing leaves and lift their infant head, Indulge their childhood, and the nursling spare. *Id.*

Him in Egerian grove Aricia bore, And nursed his youth along the marshy shore.

Id.

A luxurious court is the nursery of diseases; it breeds them, it encourages, nourishes, and entertains them. *L'Estrange.*

By what fate has vice so thriven amongst us, and by what hands been nursed up into so uncontroled a dominion? *Locke.*

The Niscans in their dark abode, Nursed secretly with milk the thriving god.

Addison.

My paper is a kind of nursery for authors; and some, who have made a good figure here, will hereafter flourish under their own names. *Id.*

Forthwith the devil did appear, Not in the shape in which he plies At miss's elbow when she lies; Or stands before the nursery doors, To take the naughty boy that roars. *Prior.*

Can tales more senseless, ludicrous, and vain, By winter-fires old nurses entertain? *Blackmore.* They have public nurseries, where all parents are obliged to send their infants to be educated.

Swift.

But I wi' my sweet nurslings here, Nae mate to help, nae mate to cheer, Pass widowed nights and joyless days, While Willie's far frae Logan braes. *Burns.* In cities vice is hidden with most ease, Or seen with least reproach; and virtue, taught By frequent lapse, can hope no triumph there Beyond the achievement of successful flight. I do confess them nurseries of the arts, In which they flourish most; where in the beams Of warm encouragement, and in the eye Of public note, they reach their perfect size.

Cowper.

Philosophy, as thou shalt hear, when she Shall have her praise, her praise and censure too, Did much, refining and exalting man; But could not nurse a single plant that bore True happiness.

Follok.

NURSE, military, a person, generally a female, whose sole business it is to attend the sick in the general or regimental hospital. She is under the immediate direction of the surgeon, and receives at the rate of one shilling per diem. Her duty is to prepare the slops and comforts for the sick, and occasionally to assist in administering medicines, cooking the victuals, washing, &c.; and for every ten men confine to bed by fever an additional nurse and order-man should be allowed. All the patients, who are able, are every morning and evening to assist in cleaning and airing the hospital, carrying away

F

dirt, &c., and by every means to assist the helpless. The additional allowance to the sergeants, orderly-men, and nurse, in regiments of the line, is to be made by the paymaster; and, in regiments of militia and fencibles, the surgeons are to pay them out of their allowances.

NURTINGEN, a town of Wirtemberg, on the Neckar, fourteen miles south-east of Stutgard. Its inhabitants, about 3400, are employed in agriculture, and manufactures of mother of pearl, musical instruments, &c. It has a good school, and had formerly a well endowed hospital. Long. 9° 20' E., lat. 48° 37' 36" N.

NURTURE, *n. s.* & *v. a.*

NUTRICATION, *n. s.*

NUTRIMENT,

NUTRIMENTAL, *adj.*

NUTRITION, *n. s.*

NUTRITIOUS, *adj.*

NUTRITIVE,

NUTRITURE, *n. s.*

tion : to educate ; train ; feed ; maintain : nutrition is the manner of being fed : nutriment, aliment ; food ; that which nourishes : nutrimental, alimental ; nourishing : nutrition, the act or quality of nourishing or supporting strength or growth ; also that which nourishes : nutritious and nutritive are synonymous of nutrimental, and nutriture is an obsolete word for the power of nourishing.

Thou broughtest it up with thy righteousness, and nurturedst it in thy law, and reformedst it with thy judgment. 2 *Eedr.* viii. 12.

She should take order for bringing up of wards in good nurture, not suffer them to come into bad hands. *Spenser.*

The thorny point

Of bare distress, hath ta'en from me the show
Of smooth civility ; yet am I inland bred,
And know some nurture.

Shakespeare. As You Like It.

This slave

Has my lord's meat in him,
Why should it thrive and turn to nutriment ?

Shakespeare.

He was nurtured where he had been born in his first rudiments, till the years of ten. *Wotton.*

Never make a meal of flesh alone, have some other meat with it of less nutritive. *Harvey.*

For this did the angel twice descend ?

Ordned thy nurture holy, as of a plant
Select and sacred. *Milton's Agonistes.*

Besides the teeth, the tongue of this animal is a second argument to overthrow this airy nutrition. *Browne.*

New parts are added to our substance to supply our continual decayings ; nor can we give a certain account how the aliment is so prepared for nutrition, or by what mechanism it is so regularly distributed. *Glauville's Scepsis.*

O may'st thou often see

Thy furrows whitened by the woolly rain

Nutritious ! secret nitre lurks within. *Philips.*

When an insolent despiser of discipline, nurtured into impudence, shall appear before a church government, severity and resolution are that government's virtues. *South.*

The stomach returns what it has received, in strength and nutriment, diffused into all the parts of the body. *Id.*

While the secretory, or separating glands, are too

much widened and extended, they suffer a great quantity of nutritive juice to pass through.

Blackmore.

By virtue of this oil vegetables are nutrimental, for this oil is extracted by animal digestion as an emulsion. *Arbutnot.*

The obstruction of the glands of the mesentery is a great impediment to nutrition ; for the lymph in those glands is a necessary constituent of the aliment before it mixeth with the blood. *Id.*

The heat equal to incubation is only nutritious ; and the nutritious juice itself resembles the white of an egg in all its qualities. *Id.*

They suppose mother earth to be a great animal, and to have nurtured up her young offspring with a conscious tenderness. *Bentley.*

Fixed like a plant on his peculiar spot,
To draw nutrition, propagate and rot. *Pope.*

Does not the body thrive and grow,

By food of twenty years ago ?

And is not virtue in mankind,

The nutriment that feeds the mind ?

Swift's Miscellanies.

Now tell me, dignified and sapient sire,

My man of morals, nurtured in the shades

Of Academus—is this false or true ?

Is Christ the abler teacher, or the schools ?

Cowper.

Inveterate habits choke the' unfruitful heart,
Their fibres penetrate its tenderest part,
And, draining its nutritious powers to feed
Their noxious growth, starve every better seed. *Id.*

NUT, *n. s.*

NUT-BROWN, *adj.*

NUT-CRACKERS, *n. s.*

NUT-GALL,

NUT-PATCH,

NUT-JOBBER, OR

NUT-PICKER,

NUT-HOOK,

NUTMEG,

NUT-SHELL,

NUT-TREE.

Sax. þnut ; Belg.

noot ; Swed. not ; Fr.

noir ; Lat. nur. A

fruit of certain trees ; a

knotted excrescence,

either of trees or ani-

mal bodies ; a small

mechanical body (pro-

bably so named from

its shape), having cogs :

nut-brown is brown

as a nut : nut-crackers, an instrument to enclose and break nut-shells : nut-gall, the excrescence of an oak tree : nut-hatch, nut-jobber, or nut-picker, names for the picus martius (see PICUS) : a nut-hook is a hook used to get at the nuts of trees ; hence (meta.), a mere tool : nutmeg (nut and *Fr. muguet*), the fruit of the MYRTICA MOSCHATA, which see : nut-shell and nut-tree explain themselves, the last being commonly used for the hazel.

I to my pleasant gardens went,
Where nutmegs breathe a fragrant scent.

Sandys.

I could be bounded in a nut-shell, and count myself a king of infinite space. *Shakespeare.*

Nut-hook, nut-hook, you lie. *Id. Henry IV.*

One chanced to find a nut

In the end of which a hole was cut,

Which lay upon a hazel root,

There scattered by a squirrel ;

Which out the kernel gotten had ;

When quoth this Fay, dear queen be glad,

Let oberon be ne'er so mad,

I'll set you safe from peril.

Drayton's Nymphiad.

Of trees you shall have the nut-tree and the oak.

Peacham.

To have a grave wise man wrangle for nut-shells, and a judge scramble for apples, is an indecency

bigger than the sin, and dishonours him by the disproportion.

Jer. Taylor.

This faculty may be more conveniently used by the multiplication of several wheels, together with nuts belonging unto each, that are used for the roasting of meat.

Wilkins.

Young and old come forth to play,
Till the live-long day-light fail,
Then to the spicy nut-brown ale.

Milton's Poems.

When this nut-brown sword was out,
With stomach huge he laid about.
In vegetable excretions, maggots terminate in flies of constant shapes, as in the nutgalls of the outlandish oak.

Browne.

The second integument, a dry and flosculus coat, commonly called mace; the fourth a kernel included in the shell, which lieth under the mace, is the same we call nutmeg.

Id.

Like beating nut-trees make a larger crop.

Dryden.

Two milk-white kids ran frisking by her side,
For which the nutbrown lass, Erithasis,
Fall often offered many a savoury kiss.
A fox had me by the back, and a thousand pound to a nut-shell, I had never got off again.

Id.

L'Estrange.

It seems as easy to me, to have the idea of space empty of body, as to think of the hollow of a nut-shell without a kernel.

Locke.

Clocks and jacks, though the screws and teeth of the wheels and nuts be never so smooth, yet if they be not oiled, will hardly move.

Ray.

King Hardicanute, 'midst Danes and Saxons stout,
Caroused in nut-brown ale, and dined on grout.

King.

He cast every human feature out of his countenance, and became a pair of nut-crackers.

Addison's Spectator.

Nuts are hard of digestion, yet possess some good medicinal qualities.

Arbuthnot on Aliments.

The nutmeg is a kernel of a large fruit not unlike the peach, and separated from that and from its investient coat, the mace, before it is sent over to us; except that the whole fruit is sometimes sent over in preserve, by way of sweet-meat, or as a curiosity. There are two kinds of nutmeg; the male, which is long and cylindrical, but it has less of the fine aromatick flavour than the female, which is of the shape of an olive.

Hill.

NUT, BLADDER. See STAPHYLEA.

NUT, CASHew. See ANACARDIUM.

NUT, COCOA. See COCOS.

NUT, EARTH. See BUNIUM.

NUT, FAUSEL. See ARECA.

NUT, HAZEL. See CORYLUS.

NUT, FIG. See BUNIUM.

NUTMEG. See MYRISTICA.

NUTRITION, in the animal economy, is the repairing, by food, the continual loss which the different parts of the body undergo. The motion of the parts of the body, the friction of these parts with each other, and especially the action of the air, would destroy the body entirely, if the loss was not repaired by a proper diet, containing nutritive juices; which being digested in the stomach, and afterwards converted into chyle, mix with the blood, and are distributed through the whole body for its nutrition. In young persons, the nutritive juices not only serve to repair the parts that are damaged, but also to increase them, which is called growth. In grown

persons, the cuticle is every where constantly desquamating, and again renewing; and in the same manner, the parts rubbed off, or otherwise separated from the fleshy parts of the body, are soon supplied with new flesh; a wound heals, and an emaciated person grows plump and fat. Buffon, to account for nutrition, supposes the body of an animal or vegetable to be a kind of mould, in which the matter necessary to its nutrition is modelled and assimilated to the whole. As to the nature of this matter, he supposes that there exists in nature an infinite number of living organical parts, and that all organised bodies consist of such organical parts; so that their existence is constant and invariable; so that the matter which the animal or vegetable assimilates to its substance is an organical matter of the same nature with that of the animal or vegetable, which consequently may augment its volume, without changing its form or altering the quality of the substance in the mould. 'As to the power that communicates it, there exist,' says he, 'in nature certain powers, as that of gravity, that have no affinity with the external qualities of the body, but act upon the most intimate parts, and penetrate them throughout, and which can never fall under the observation of our senses.' And, lastly, he supposes that the internal mould itself is reproduced, not only by a similar power, but that it is the very same power that causes the unfolding and reproduction thereof; 'for it is sufficient,' proceeds he, 'that in an organised body that unfolds itself there be some part similar to the whole, in order that this part may one day become itself an organised body, altogether like that of which it is actually a part. See ALIMENT and PHYSIOLOGY.

NUX VOMICA, a flat, compressed, round, and poisonous fruit, about the breadth of a shilling, brought from the East Indies. Its surface is not much corrugated; and its texture is firm like horn, and of a pale grayish-brown color. It is said to be used as a specific against the bite of a species of water-snake. It is considerably bitter and deleterious; and has been used in doses from five to ten grains twice a-day or so, in intermittents, particularly quartans, and in contagious dysentery. The strychnus Ignatii is a tree of the same kind, producing a gourd-like fruit, the seeds of which are improperly called St. Ignatius's beans. These, as also the woods or roots of some such trees, called lignum colubrinum, or snakewood; are very narcotic bitters, like the nux vomica.

To NUZZLE, *v. a.* Corrupted from nurse; but some writers have supposed it to come from nozzle or nose, and in that sense used it. To nurse; to foster; thrust forward the nose.

Old men long nuzzled in corruption, scorning them that would seek reformation.

Sidney.

He charged through an army of lawyers, sometimes with sword in hand, at other times nuzzling like an eel in the mud.

Arbuthnot.

Sir Roger shook his ears, and nuzzled along, well satisfied that he was doing a charitable work.

Arbuthnot's John Bull.

The blessed benefit, not there confined,
Drops to the third who nuzzles close behind.

Rope.

NYCHTHEMERON, among the ancients signified the whole natural day, or day and night,

consisting of twenty-four hours, or twenty-four equal parts. See DAY. Before the Jews had introduced the Greek language into their discourse, they used to signify this space of time by the simple expression of a night and a day. It is proper here to observe that all the eastern countries reckoned any part of a day of twenty-four hours for a whole day; and say a thing that was done on the third or seventh day, &c., from that last mentioned, was one after three or seven days. And the Hebrews having no word which exactly answers to the Greek *Νυχθημερον*, signifying 'a natural day of twenty-four hours,' use night and day, or day and night, for it. So that to say a thing happened after three days and three nights, was, with them, the same as to say it happened on the third day. This explains what is meant by 'the Son of Man's being three days and three nights in the heart of the earth.'

NYCTANTHES, Arabian jasmine, a genus of the monogynia order, and diandria class of plants; natural order forty-fourth, sapiaræ: COR. CAL. octofid: perianth. dicoccous: CAPS. two-celled: SEEDS solitary: species one only.

N. arbor tristis, the melancholy or sorrowful tree. This shrub, the pariatacu of the Bramins, grows naturally in sandy places in India, particularly in Ceylon and Java, where it is produced in great abundance, and attains the height of eighteen or twenty feet. It rises with a four-cornered stem, bearing leaves that are oval, and taper to a point. They stand opposite on short foot-stalks: are of a shining brownish-green on the upper side, a more vivid green on the under, and of a taste that is astringent and somewhat bitter. From the middle rib, on the under surface of the leaves, proceed on both sides a number of costulæ or smaller ribs, which run nearly to the margin, and mark the surface with the impression of their arched furrows. The flowers, which are white and highly odoriferous, having a sweet smell, consist of one petal deeply divided into eight parts, which are narrower towards the stalk, and dilated towards the summit. They stand upon foot-stalks, which emerge from the origin of the leaves; are rigid, obliquely raised towards the top, grow opposite in pairs, and are divided into three short lesser branches, which each support five flowers placed close together, without partial foot-stalks. The fruit is dry, capsular, membranaceous, and compressed. It is generally asserted of this plant, that the flowers open in the evening, and fall off the succeeding day. Fabricius and Paludanus, however, affirm, from actual observation, that this effect takes place only in such flowers as are immediately under the influence of the solar rays. Grimmus remarks, in his *Laboratorium Ceylonicum*, that the flowers of this tree afford a fragrant water, which is cordial, refreshing, and often employed with success in inflammations of the eyes. The tube of the flower, when dried, has the smell of saffron; and, being pounded and mixed with sanders wood, is used by the natives of the Malabar coast for imparting a grateful fragrantcy to their bodies, which they rub or anoint with the mixture.

NYCTASTRATEGI, among the ancients, were officers appointed to prevent fires in the

night, or to give alarm and call assistance when a fire broke out. At Rome they had the command of the watch, and were called nocturni triumviri, from their office and number.

NYCTEUS, in fabulous history, a son of Neptune, by Celene, king of Lesbos, or Thebes; who married Amalthæa, by whom he had Nyctimene and Antiope, the mother of Amphion and Zethus. He was mortally wounded in battle by Epopeus, who had carried off Antiope.

NYCTIMENE, a daughter of Nyctæus, who, having committed incest with her father by means of her nurse, was changed into an owl by Minerva.

NYE (Philip), an English nonconformist, a native of Sussex, was born about 1596. After attending at a grammar school, he was sent to Oxford, and entered a commoner of Brazen-nose College, in 1615, whence he removed to Magdalen Hall. He was admitted A. B. and A. M. in 1619 and 1622, about which time he entered into orders, and was, in 1620, curate of St. Michael's church in Cornhill, London. Resolving, however, to reject the constitution of the Church of England, he became obnoxious to all the censures of the episcopal court; to avoid which he went to Holland, in 1633. He continued at Arnheim till 1640; when, the power of the parliament beginning to prevail over the king, he returned home, and was soon after made minister of Kimbolton in Huntingdonshire, by Edward lord Kimbolton, then earl of Manchester. In 1643 he was appointed one of the assembly of divines at Westminster, and became a great champion of the Presbyterians, and of the solemn league and covenant; and, having married the daughter of Stephen Marshall, was sent with his father-in-law into Scotland the same year, to expedite the taking of the covenant. After his return both houses of parliament took the covenant the same year; when he preached a sermon in defence of it, showing its warrant from Scripture, and was rewarded with the rectory of Acton near London, in the room of Dr. Daniel Featley, who was ejected. Not long after, however, Nye disagreed with the assembly, and opposed their plan of discipline, joining the Independents. In December, 1647, he was sent with Stephen Marshall, to the king at Carisbrook Castle, in attendance upon the commissioners then appointed. Nye was also employed about that time to obtain subscriptions from the apprentices in London, &c., against a personal treaty with the king, while the citizens of that metropolis were petitioning for one. In April, 1648, he was employed, as well as Marshall and Joseph Caryl, by the Independents, to invite the secured and secluded members to sit in the house again, but without success. In 1653 he was appointed one of the triers for the approbation of public preachers; in which office he not only procured his son to be clerk, but, with the assistance of his father-in-law, obtained for himself a living of £400 a-year. In 1654 he was joined with Dr. Lazarus Seaman, Samuel Clark, Richard Vines, Obadiah Sedgwick, Joseph Caryl, &c., as an assistant to the commissioners appointed by parliament to eject such as were then called scandalous and ignorant minis-

ters and schoolmasters' in London. After the Restoration, in 1660, it was debated for several hours together, whether he and John Goodwin should be deprived of the benefits of the act of indemnity. The result was, that 'if Philip Nye, clerk, should, after the 1st September, 1660, accept or exercise any office, ecclesiastical, civil, or military, he should, to all intents and purposes in law, stand as if he had been totally excepted for life.' In November, 1662, he was suspected to be engaged in Tongue's plot; but the suspicion was never proved. He died in Cornhill, London, in September 27th, 1672, and was buried in the upper vault of the said church.

NYIREGYHAZA, a town of Hungary, in the palatinate of Szaboles. It contains churches for Lutherans, Calvinists, Catholics, and Greek Christians. The employment of the inhabitants (about 8000) consists chiefly in the tillage of the vicinity, the rearing of cattle, and making wine. Twenty-nine miles north of Debreczin, and 123 E. N. E. of Pest.

NYKOPING, a town and government of Sweden, containing the western and most considerable part of Sodarmaria. The town is well built, with broad and straight streets; but its population is not above 2400. Its manufactures and its trade and navigation are considerable; and the Swedish language is supposed to be spoken in its greatest purity here. Forty-nine miles south-west of Stockholm.

NYLAND, a province of European Russia, in Finland, bounded by the gulf of Finland, Carelia, Tavastland, and Finland Proper. Its area is 4880 square miles, consisting of good pasturage, and extensive forests. The fisheries supply a considerable part of the food; the mineral chiefly found is copper. It has several small lakes, from one of which issues the Kymamene. Inhabitants 115,000.

NYL-GHAU, in zoology, an East Indian animal, classed as a species of antelope, by Drs. Gmelin and Pallas, Messrs. Pennant, Kerr, &c., though others reckon it a species of bos. The name denotes a blue cow, or bull. The nyl-ghau is larger than any ruminant of this country, except the ox; its flesh is delicious. In size it appears to be between black cattle and deer; and in its form also there is a very evident resemblance to both. Its body, horns, and tail, are not unlike those of a bull, and the head, neck, and legs, are very like those of a deer. Mr. Hunter, who dissected it, apprehends that it is an entirely new and distinct genus. The color, in general, is ash or gray, from a mixture of black hairs and white; the height of the back is about four feet, and the trunk, from the root of the neck to the pendulous tail, is about the same length; along the ridge of the neck the hair forms a short and thin upright mane; the legs are small in proportion to their length; the neck is long and slender as in the deer; at the throat there is a shield-like spot of beautiful white hair; and lower down, on the beginning of the convexity of the neck, there is a mane-like tuft of long black hair. There are six grinders on each side of the jaw; and four incisores in each half of the lower jaw; the horns are seven inches long, and of a triangular shape. The nyl-ghau

eats oats, but is fonder of grass and hay. It is vicious and fierce in the rutting season, but at other times tame and gentle. The female differs so much from the male that we should scarcely suppose them to be of the same species. She is much smaller, both in height and thickness. In her shape and yellowish color she very much resembles deer, and has no horns; yet has four nipples, and is supposed to go nine months with young; she has commonly one at a birth, and sometimes twins. The young male nyl-ghau resembles the female in color.

NYMPH, *n. s.* Lat. *nympha*; Gr. *νυμφη*. A goddess of the woods, meadows, or waters.

And as the moisture which the thirsty earth

Sucks from the sea to fill her empty veins,

From out her womb at last doth take a birth,

And runs a nymph along the grassy plains. *Davies.*

This resolve no mortal dame,

None but those eyes could have overthrown;

The nymph I dare not, need not name. *Waller.*

Tending all to nymphish war. *Drayton.*

NYMPH, in entomology, that state of winged insects between their living in the form of a worm, and their appearing in the winged or most perfect state. The eggs of insects are first hatched into a kind of worms or maggots; which afterwards pass into the nymph state, surrounded with shells or cases of their own skins; so that in reality, these nymphs are only the embryo insects wrapped up in this covering, from which they at last get loose, though not without great difficulty. During this nymph state the creature loses its motion. Swammerdam calls it *nympha aurelia*, or simply *aurelia*; and others give it the name of *chrysalis*, a term of the like import; but modern entomologists prefer the term *pupa* to both. See **ENTOMOLOGY**.

NYMPHS, in mythology, were certain inferior goddesses, inhabiting the mountains, woods, waters, &c., said to be the daughters of Oceanus and Tethys. All the universe was represented as full of these nymphs, who are distinguished into several ranks or classes. The general division of them was into celestial and terrestrial. The former were called *Uranizæ*, and were supposed to be intelligences that governed the heavenly bodies or spheres; the latter, called *Epigeizæ*, presided over the several parts of the inferior world, and were divided into those of the waters and those of the earth. The nymphs of the water were the *oceanides*, or nymphs of the ocean; the *nereids*, the nymphs of the sea; the *naiads* and *ephydriades*, the nymphs of the fountains; and the *limniades* the nymphs of the lakes. The nymphs of the earth were the *oreades*, or nymphs of the mountains; the *napææ*, nymphs of the meadows; and the *dryads* and *hamadryads*, were nymphs of the forests and groves. Besides these we meet with nymphs who took their names from particular countries, rivers, &c., as the *Cithæroniades*, so called from Mount Cithæron in Bæotia; *Dodonides*, from Dodona; *Tiberiades*, from the Tiber, &c. Goats were sometimes sacrificed to the nymphs; but their constant offerings were milk, oil, honey, and wine. They were supposed to enjoy longevity, but not to be immortal. They are described as sleepless, and dreaded by the country people. They were rum-

ceptible of passion. The Argonauts landing on the shore of the Propontis, in their way to Colchus, sent Hylas, a boy, for water, who discovered a lonely fountain, in which the nymphs Eunica, Malis, and Nycheia, were preparing to dance; and these seeing him were enamoured, and, seizing him by the hand as he was filling his vase, pulled him in. The nymphs, it was the popular persuasion, occasionally appeared; and nympholepsy is characterised as a phrenzy which arose from having beheld them. On Cithæron, in Bœotia, there were nymphs called Sphragitides, whose cave, once also oracular, was on a summit of the mountain. Their dwellings had generally a well or spring of water; the former often a collection of moisture condensed or exuding from the roof and sides; and this, in many instances, being pregnant with stony particles, concreted, and marked its passage by incrustations, the ground-work in all ages and countries of idle tales framed or adopted by superstitious and credulous people. A cave in Paphlagonia was sacred to the nymphs who inhabited the mountains about Heraclea. It was long and wide, and pervaded by water, clear as crystal. There also were seen bowls of stone, and nymphs and their webs and distaffs, and curious work, exciting admiration.

NYPHÆ, in anatomy, two membranaceous parts, situated on each side of the rima. See **ANATOMY**.

NYPHÆA, in antiquity, structures about which the learned are not agreed. Some take them to have been grottoes, deriving their name from the statues of the nymphs with which they were adorned; but that they were considerable works appears from their being executed by the emperors, or by the city prefects. In an inscription, the term is written *nymfium*. Scarce any of these nymphæa have lasted down to our time; but one was discovered some years ago between Naples and Vesuvius. It is a square building, with only one entrance, and some steps that went down to it. On the right hand, in entering towards the head, there is a fountain of the purest water; along which is laid a naked *Arethusa* of the whitest marble; the bottom or ground is of variegated marble, and encompassed with a canal fed by the water from the fountain; the walls are set round with shells and pebbles of various colors; by the setting of which, as in a mosaic picture, are expressed the twelve months of the year, and the four political virtues; also the rape of *Proserpine*; *Pan*, playing on his reed, and soothing his flock; besides the representations of nymphs swimming, sailing, and wantoning on fishes, &c. It seems pretty evident that the nymphæa were used as baths; for, at the same time that they were furnished with pleasing grottoes, they were also supplied with cooling streams, by which they were rendered exceedingly delightful, and drew great numbers of people to frequent them. Silence seems to have been a particular requisite here, as appears by this inscription:—‘*Nymphis loci, bibe, lava, tace.*’

NYPHÆA, in botany, the water lily; a genus of the monogynia order, polyandria class of plants; natural order fifty-fourth, miscellanæ: con. polypetalous: cal. tetraphyllous or penta-

phyllous; berry multilocular and truncated. There are five species:—

1. *N. alba*, the white water lily, is a native of Britain, and grows in lakes and ditches. The root has an astringent and bitter taste, like those of most aquatic plants that run deep into the mud. The Highlanders make a dye with it, of a dark chestnut color.

2. *N. lien-hoa*, or *nenufar*, a native of China, is highly extolled in that country for its virtues, and ranked among those plants which are employed in the composition of the liquor of immortality. The seeds are there eaten as we eat filberts in Europe: they are more delicate when they are green, but harder of digestion; they are preserved in many different ways with sugar. The root of this plant is also admitted by the Chinese to their tables: in whatever manner it be prepared, it is equally wholesome. Great quantities are pickled with salt and vinegar, which they reserve to eat with their rice. When reduced to powder, it makes excellent soup with water and milk. The leaves of the *nenufar* are much used for wrapping up fruits, fish, salt provision, &c. When dry, the Chinese mix them with their tobacco, to render it softer and milder.

3. *N. lotus*, the Egyptian lotus, with heart-shaped toothed leaves, thought to be peculiar to Egypt, is thus mentioned by *Herodotus*: ‘when the river Nile is become full, and all the grounds round it are a perfect sea, there grow a vast quantity of lilies, which the Egyptians call *lotus*, in the water. After they have cut them, they dry them in the sun; then, having parched the seed within the *lotus*, which is most like the poppy, they make bread of it, baking it with fire. The root also of the *lotus* is eatable, easily becoming sweet, being round, and of the size of an apple. *M. Savary* mentions it as growing in the rivulets and on the sides of the lakes; and there are two sorts of varieties of the plant, the one with a white, the other with a bluish flower. ‘The calyx,’ he says, ‘blows like a large tulip, and diffuses a sweet smell, resembling that of the lily. The first sort produces a round root like that of a potatoe; and the inhabitants of the banks of the lake *Menzel* feed upon it. The rivulets in the environs of *Damietta* are covered with this majestic flower, which rises upwards of two feet above the water.’ The high veneration in which the nymphæa *lotus* was held by the Egyptians, is well known; and it is still equally venerated by the Hindoos. See **LOTUS**.

4. *N. lutea*, the yellow water lily, is a native of Britain, growing in lakes and ditches. *Linneus* tells us that the swine are fond of the leaves and roots, and that the smoke of it will drive away crickets and *blattæ*, or cock-roaches, out of houses.

5. *N. nelumbo*, is a native of the East and West Indies, called *nelumb* in Ceylon. The leaves which rest upon the surface of the water are smooth, undivided, perfectly round, thick, target-shaped, and about one foot and a half in diameter. The foot-stalk of the leaves is prickly; and inserted, not into the base, or margin, as in most plants, but in the centre of the lower disk or surface. From this centre, upon the upper

surface, issue, like rays, a great number of large ribs, or nerves, which, towards the circumference, are divided and subdivided into a small number of very minute parts. The flowers are large, flesh-colored, and consist of numerous petals, disposed, as in the other species of water-lily, in two or more rows. The seed-vessel is shaped like a top, being broad and circular above, narrow and almost pointed below. It is divided into several distinct cells, which form so many large round holes upon the surface of the fruit; each containing a single seed. The stalks, which are used as a pot herb, are of wonderful length. The root is very long, extends itself transversely, is of the thickness of a man's arm, jointed and fibrous, with long intervals betwixt the joints. The fibres surround the joints in verticilli or whirls.

NYMPHÆUM, in ancient geography, a sacred place near Apollonia, in Illyricum, sending forth continually fire in detached streams from a green valley and verdant meadows. *Plutarch*. Dio Cassius adds, that the fire neither burns up nor parches the earth, but that herbs and trees grow and thrive near it, and therefore the place is called *Nymphæum*; near which was an oracle. It was there that the sleeping satyr was caught, which is said to have been brought to Sylla as he returned from the Mithridatic war.

NYMPHIDIUS (Sabinus), a person of mean descent, but appointed by Nero colleague of Tigellinus in the command of the prætorian guards. About the time, however, that the German legions revolted from this despicable prince, he was also betrayed by Nymphidius, and abandoned by his guards. Nymphidius pretended to espouse the cause of Galba, but, after Nero's death, usurped the supreme authority. Galba, however, was again acknowledged and proclaimed, and Nymphidius, notwithstanding his artifices, detected and slain by the soldiers who were proclaiming Galba.

NYS. Corrupted of *ne is*. None is; not is. Obsolete.

Thou findest fault, where *nys* to be found,
And buildest strong work upon a weak ground.

Spenser.

NYSA, or **NYSSA**, in ancient geography, a town of Ethiopia, south of Egypt. Some place it in Arabia. This city, with another of the same name in India, was sacred to Bacchus, who was said to have been educated there by the nymphs of the place, and who received the name of Dionysius, from *Διός*, Jupiter, and *Νύσα*, the place of his education. Bacchus made this place the seat of his empire, and the capital of the conquered nations of the east.

NYSSA, in botany, a genus of the order *diœcia*, and polygamia class of plants; natural order twelfth, *holoracæ*: *HERM. CAT.* quinquepartite: *cor.* none: the stamina are five; there is one pistil; fruit a plum inferior: *MAL. CAT.* quinquepartite, no corolla, and ten stamina. There is only one species, viz.

N. aquatica, the tupelo tree. It is a deciduous tree or shrub, a native of moist or watery places in America, and consists of two varieties; the entire-leaved, and the serrated-leaved tupelo. The entire-leaved tupelo tree, in its native soil and climate, grows to nearly twenty feet high; in

this country its size varies according to the soil or situation. In a moist rich earth, well sheltered, it rises to nearly twenty feet; in others, that are less so, it makes slower progress, and is proportionally lower. The branches are not very numerous; and it rises with a regular trunk, at the top of which they generally grow. The leaves are of a lanceolated figure, and of a fine light-green color. They end in acute points, and are very ornamental, of a thickish consistence, soft, grow alternately on pretty long foot-stalks, and often retain their verdure late in the autumn. The flowers, which are not very ornamental, are produced from the sides of the branches, growing sometimes singly, sometimes many together, on a foot-stalk. They are of a greenish color; and, in the countries where they naturally grow, are succeeded by oval drupes, enclosing oval, acute, furrowed nuts. In England they seldom produce fruit.

The serrated-leaved tupelo tree grows usually nearly thirty feet in height; and divides into branches, near the top, like the other. The leaves are oblong, pointed, of a light-green color, and come out without order on long foot-stalks. The flowers come out from the wings of leaves on long foot-stalks. They are small, of a greenish color; and are succeeded by oval drupes containing sharp-pointed nuts, about the size of a French olive. The propagation of these trees is from seeds, which come from America. As soon as they arrive they should be sown in large pots of light sandy earth an inch deep. No plants come up the first spring. The gardener, after this work is done, should plunge his pots up to their rims in the ground; and, if it be a moist place, it will be the better. Weeding must be observed during the summer; and a few furze bushes should be pricked round the pots in November, which will prevent the ground from freezing, and forward the coming up of the seeds. In the next spring the pots should be plunged into a hot-bed, after which the seeds will soon appear. As much air as possible, and watering, should be afforded them; and they must be hardened soon to be set out. The pots should then be plunged to their rims again in the natural mould; where they are to remain till October. Watering must be given them; and they should also be shaded in the heat of the day. In October they must be housed with other green-house plants, or else set under a hot-bed frame, or some other cover, during winter. The third spring they should be taken out of the larger pots, and each planted in a smaller; in which their growth may be assisted by a gentle heat in a bed; and if they are planted up to the rims in a moist place, and shaded in dry weather, they will grow very well. Though by this time they should have become hardy, yet it will be proper to shelter them the winter following in bad weather. They require little more care during their stay in the pots, which may be either two, three, or more years, if they are large enough; when in spring they may be turned out, with the mould, into the places where they are to remain, which ought always to be moist and properly sheltered.

O.

O, as a letter, is the fourteenth in the alphabet, and the fourth vowel. In English, has a long sound; as in drone, groan, stone, alone, cloke, broke, coal, droll; or short, as in got, knot, shot, prong, long; the long sound is often denoted by a servile *a* or *u* subjoined; as in moan, soul; or by *e* at the end of a syllable; as in bone: when these vowels are not appended, it is generally short, except before *ll*; as, droll, scroll, and even then, sometimes, as in loll, poll. Its sound is often so soft as to require it double, and that chiefly in the middle of words; as, goose, reproof, &c. And in some words this *oo* is pronounced like *u* short; as in flood, blood, &c. In Irish O signifies a descendant, being abbreviated from og, ogha, young; it is also used as a possessive or equivalent to the English of, as in Clem o' Cleugh. O is also an interjection of wishing or exclamation. It is used with no great elegance by Shakspeare for a circle or oval.

Can this cockpit hold
The vasty field of France? or may we cram
Within this wooden O, the very casks
That did affright the air at Agincourt. *Shakspeare.*

O! by what name, for thou above all these,
Above mankind, or aught than mankind higher,
Surpasest far my naming, how may I
Adore thee, Author of this universe,
And all this good to man? *Milton.*

O unexpected stroke, worse than of death!
Must I thus leave thee, Paradise? thus leave
Thee, native soil, these happy walks and shades
Fit haunt of gods? *Id.*

O that we, who have resisted all the designs of his
love, would now try to defeat that of his anger!

Decay of Piety.
O! were he present, that his eyes and hands
Might see, and urge the death which he commands.
Dryden.

The Greeks had two O's; viz. omicron, *o*, and omega, *ω*; the first pronounced on the tip of the lips with a sharper sound; the second in the middle of the mouth, with a fuller sound, equal to *oo* in our language. As a numeral O was sometimes used for 11 among the ancients; and with a dash over it, thus Ō, for 11,000. In modern arithmetic it is used for the cypher, and represents nothing. (See ARITHMETIC.) As an abbreviation, in the notes of the ancients, O. CON. is read opus conductum; O. C. Q. opera consilique; O. D. M. opere donum munus; and O. LO. opus locatum. Among the Irish, the letter O, at the beginning of the name of a family, is said to be a character of dignity annexed to great houses. Thus, in the history of Ireland, we frequently meet with the O Neals, O Carrols, &c., considerable houses in that island. Camden observes that it is the custom of the lords of Ireland to prefix an O to their names, to distinguish them from the commonalty. In music, the ancients used O as a mark of triple time; from a notion that the ternary, or number three, was the most perfect of numbers, and therefore properly expressed by a circle, the most perfect of figures. It is not, strictly speaking, the letter O, but the

figure of a circle O, or double CO, used to express tempo perfecto, or triple time. Hence the Italians call it circolo. The seven antiphones, or alternate hymns of seven verses, &c., sung by the choir in the time of Advent, were formerly called O, from their beginning with such an exclamation.

OAF, *n. s.* This word is also written auff, ofe, and oph. Goth. *alf*; Teut. *auf*. It seems a corruption of ouph, a demon or fairy, says Dr. Johnson; in Germ. *aff*, from which elf; and means properly the same with changeling; a foolish child left by malevolent ouphs or fairies in the place of one more witty. A changeling a foolish child left by the fairies.

These, when a child haps to be got
Which after proves an idiot,
When folk perceives it thriveth not,
The fault therein to smother:
Some silly doating brainless calf,
That understands things by the half,
Says that the fairy left this oaf,
And took away the other.

Drayton's Nymphid.

OAK, *n. s.* Sax. *ac*, *œc*, 'signifying
OAK-APPLE, } strength,' Skinner says, 'to
OAK'EN, *adj.* } show how easy it is to play

OAKEN-PIN, *n. s.* the fool, under a show of literature and deep researches, I will, for the diversion of my reader, derive from *ouac*, a house; the oak being the best timber for building.' He seems to have had Junius in his thoughts, who on this word has shown his usual fondness for Greek etymology. 'Ac or oak,' says that critic, 'signified among the Saxons, like robur among the Latins, not only an oak but strength, and may be well enough derived, 'non incommode deduci potest,' from *αλη* strength; by taking the three first letters, and then sinking the *α*, as is not uncommon. The QUERCUS, which see: oaken is made of oak: oaken-pin, a kind of apple.

He returned with his brows bound with oak
Shakspeare.

He lay along
Under an oak, whose antique root peeps out
Upon the brook that brawls along this wood. *Id.*
No tree beareth so many bastard fruits as the oak:
for, besides the acorns, it beareth galls, oak apples,
oak nuts, which are inflammable, and oak berries,
sticking close to the body of the tree without stalk.

Bacon's Natural History.
No nation doth equal England for oaken timber
wherewith to build ships. *Bacon's Advice to Villiers.*

By lot from Jove I am the power,
Of this fair wood, and live in oaken bower. *Milton.*
The monarch oak, the patriarch of the trees,
Shoots rising up, and spreads by slow degrees:
Three centuries he grows, and three he stays
Supreme in state; and in three more decays.

Dryden.
Clad in white velvet all their troop they led,
With each an oaken chaplet on his head. *Id.*
An oak growing from a plant to a great tree, and
then lopped, is still the same oak. *Locke.*
Oaken pin, so called from its hardness, is a lasting
fruit, yields excellent liquor, and is near the nature
of the Westbury apple, though not in form.

Mortimer.

An *oaken* garland to be worn on festivals was the recompense of one who had covered a citizen in battle.

Addison.

A light, earthy, stony, and sparry matter incrustated and affixed to *oak* leaves.

Woodward on Fossils.

He snatched a good tough *oaken* cudgel, and began to brandish it.

Arbuthnot's John Bull.

Let India boast her plants, nor envy we

The weeping amber and the balmy tree,

While by our *oaks* the precious loads are born,

And realms commanded which those trees adorn.

Pope.

The *oak*-tree hath male flowers, or katkins, which consist of a great number of small slender threads. The embryos, which are produced at remote distances from these on the same tree, do afterwards become acorns, which are produced in hard scaly cups: the leaves are sinuated. The species are five.

Miller.

The fruit is an acorn like the common *oak*. The wood of this tree is accounted very good for many sorts of tools and utensils; and affords the most durable charcoal in the world.

Id.

It seems idolatry, with some excuse,

When our fore-father Druids in their *oaks*

Imagined sanctity.

Cowper

And such in ancient halls and mansions drear

May still be seen; but perforated sore,

And drilled in holes, the solid *oak* is found,

By worms voracious eating through and through.

Id.

OAK BARK, the bark of the oak, which is very useful in tanning. See **TANNING**. The bark of oak trees was formerly thought to be extremely useful in vegetation. One load (Mr. Mills in his Treatise on Husbandry informs us) of oak bark, laid in a heap and rotted, after the tanners have used it for dressing of leather, will do more service to stiffen cold land, and its effects will last longer, than two loads of the richest dung; but this has been strenuously controverted. The bark, in medicine, is also a strong astringent; and hence is recommended in hemorrhages, alvine fluxes, and other preternatural or immoderate secretions; and in these it is sometimes attended with good effects. Some have alleged that by the use of this bark every purpose can be answered which may be obtained from Peruvian bark. But, after several very fair trials, this is found not to be the case. Besides the bark, the buds, the acorns, and their cups are used; as also the galls, which are excrescences, caused by insects, on the oaks of the eastern countries, of which there are divers sorts; some perfectly round and smooth, some rougher with small protuberances, but all generally having a round hole in them. All the parts of the oak are styptic, binding, and useful in all kinds of fluxes and bleedings, either inward or outward. The bark is frequently used in gargarisms, for the relaxation of the uvula, and for sore mouths and throats: it is also used in restraining clysters and injections, against the prolapsus uteri or ani. The acorns, beaten to powder, are frequently taken by the vulgar for pains in the side.

OAK LEAF GALLS are of several kinds; the remarkable species, called the mushroom gall, is never found on any other vegetable substance but these leaves; and, besides this, there are a great number of other kinds. The double gall of these leaves is very singular, because the generality of productions of this kind affect only

one side of a leaf or branch, and grow all one way; whereas this kind of gall extends itself both ways, and is seen on each side of a leaf, in form of two protuberances, opposite the one to the other. These are of differently irregular shapes; but their natural figure seems that of two cones, with broad bases, and very obtuse points, though sometimes they are round, or very nearly so. These make their first appearance on the leaf in April, and remain on it till June or longer. They are at first green, but afterwards yellowish, and are softer to the touch than many other of the productions of this kind; they are usually about the size of a large pea; but sometimes they grow to the bigness of a nut. When opened, they are found to be of that kind which are inhabited each by one insect only, and each contains one cavity. The cavity in this is, however, larger than in any other gall of the size, or even in many others of three times the size; the sides of it being very little thicker than the substance of the leaf. It is not easy to ascertain the origin of the several species of flies which are at times seen in this manner to come out of the same species of galls. It seems the common course of nature that only one species of insect forms one kind of gall; yet it may be that two or three kinds may give origin to the same kind. There is, however, another occasion of our seeing different species come out of different galls of the same kind; and this is the effect of the enemies of the proper inhabitants. It might appear that the parent fly, when she had formed a gall for the habitation of her worm-offspring, had placed in an impregnable fortress: but this is not the case; for it frequently happens that a fly, as small perhaps as that which gave origin to the gall, produces a worm which is of the carnivorous kind, as the other feeds on vegetable juices. This little fly, well knowing that where there is one of these protuberances on a leaf there is a tender and defenceless insect within, pierces the sides of the gall, and deposits her egg within it. This, when it hatches into a worm, feeds upon the proper inhabitant; and, finally, after devouring it, passes into the chrysalis state, and thence appears in the form of its parent fly, and is seen making its way out of the gall, in the place of the proper inhabitant. On opening these leaf galls, which are properly the habitation only of one animal, it is common to find two, the stronger preying upon the body of the other, and sucking its juices as it does those of the leaf; often it is found wholly employed in devouring its unoffending neighbour at once: this is probably the case when its time of eating is nearly over; and, in fine, when we find the gall inhabited by only one insect, or containing only one chrysalis, as it ought in its natural state to do, we are never certain that this is the proper inhabitant, as it may be one of these destroyers who has eaten up the other, and supplied its place. See **APHIS** and **PUCERON**.

OAK LEAVES. The uses of oak bark in tanning and in hot-beds are generally known. For the latter of these purposes, however, oak-leaves are now found to answer equally well, or better. When raked into heaps, the leaves should immediately be carried into some place near the

hot-houses, where they may lie to couch. In this place they tread them well, and water them in case they happen to have been brought in dry. The heap is made six or seven feet thick, and covered over with old mats, or any thing else, to prevent the upper leaves from being blown away. In a few days the heap will come to a strong heat. It will be proper to let them remain five or six weeks in the heaps before they are again watered, and trodden down, in layers, till the pits are quite full. The whole is then covered with a tan bark, to the thickness of two inches, and well trodden down, till the surface becomes smooth and even. On this the pine-pots are to be placed in the manner they are to stand, beginning with the middle row first, and filling up the spaces between the pots with tan. In this manner we are to proceed to the next row, till the whole is finished; and this operation is performed in the same manner as when tan only is used. The leaves require no farther trouble through the whole season; as they will retain a constant and regular heat for twelve months without stirring or turning; and our author informs us, that, if he may judge from their appearance when taken out (being always entire and perfect), it is probable they would continue their heat through a second year; but, as an annual supply of leaves is easily obtained, the experiment is hardly worth making.

OAKA, or OAKAMUNDAT, a district of Gujerat, Hindostan, situated on the south side of the Gulf of Cutch, and separated by the swamp called the Run from the mainland. This swamp, which is from five to six miles broad, is during the spring tides covered by the sea to the height of one or two feet. The bottom is a firm sand, but covered with mud. The soil here is in general very poor, and produces little else than two species of coarse grain. The few inhabitants, however, breed a number of camels, but the occupation of the greater part is piracy. They are governed by various independent chiefs.

OAKA, the capital of the above district, was long celebrated as the nest of a gang of pirates, who recently received a severe chastisement from the British flag. The practice was, previous to undertaking a cruise, to visit the temple of their idol at Dwarca, and vow that, if they were successful, they would devote a certain portion of their plunder to the deity; by which means the Brahmins were so enriched that they are said to have had several ships of their own in this service. Long. 69° 36' E., lat. 22° 14' N.

OAKHAM. See OKEHAM.

OAKHAMPTON, a borough and market town of Devonshire, situate near the source of the small river Oak, twenty-one miles west from Exeter, and 195 west from London. The church is situate on a hill, and in the market place is an ancient chantry chapel. In the suburbs are the ruins of an ancient castle, dismantled by Henry VIII. on the attainer of Henry Courtenaye, marquis of Exeter. It has a small manufactory of serges. It is a very ancient borough, and is governed by a mayor, eight aldermen, eight common-council, town-clerk, &c., and sends two members to parliament; the mayor is chosen annually by the corporation, from among the

eight aldermen or principal burgesses. The market is on Saturday.

OAKUM, *n. s.* 'Formed by some corruption,' says Dr. Johnson: but there is a regular Saxon *oecumbe*, i. e. combings, refuse. Cords untwisted and reduced again to hemp, with which leaks are stopped.

They make their *oakum*, wherewith they calk the seams of the ships, of old seer and weather-beaten ropes, when they are over spent and grown so rotten as they serve for no other use but to make rotten *oakum*, which moulders and washes away with every sea as the ships labour, and are tossed. *Raleigh.*

Some drive old *oakum* through each seam and rift; Their left hand does the calking-iron guide, The rafter's mallet with the right they lift.

Dryden.

OANNES, a being in Chaldean mythology, represented as half a man and half a fish. According to Berosus and others, this monster was the civiliser of the Chaldeans; to whom he taught a system of jurisprudence so perfect as to be incapable of improvement. See MYTHOLOGY.

OAR', *n. s.*, *v. n.*, & *v. a.* } Sax. *ape*; Goth.

OAR'Y, *adj.* } and Swed. *ar*;

Teut. *opr*; Belg. *oar* (which also signifies the ear). Johnson with superabundant learning says, 'perhaps by allusion to the common expression of plowing the water, from the same root with ear to plow; Lat. *aro*;' as if any illiterate people would row thus far about to a word of such frequent use as this. Minshew suggests its more probable corruption from ROAR (Sax. *paþuan*), which see. The instrument of rowing; to row or impel by rowing: *oary* is having the form or use of an oar.

The *oars* were silver,
Which to the tune of flutes kept stroke, and made
The water, which they beat, to follow faster,
As amorous of their strokes.

Shakspeare. Antony and Cleopatra.

His bold head

'Bove the contentious waves he kept, and oared
Himself with his good arms in lusty strokes
To th' shore. *Id. Tempest.*

So towards a snip the oar-fanned gallies play,
Which wanting sea to ride, or wind to fly,
Stands but to fall revenged. *Denham's Poems.*

Its progressive motion may be effected by the help
of several *oars*, which in the outward ends of them
shall be like the fins of a fish to contract and dilate.

Wilkins.

The swan with arched neck,
Between her white wings mantling, proudly rows
Her state with *oary* feet. *Milton.*

In shipping such as this, the Irish kern
And unt taught Indian, on the stream did glide,
E'er sharp-keeled boats to stem the flood did learn,
Or fin-like *oars* did spread from either side.

Dryden.

His hair transforms to down, his fingers meet
In skinny films, and shape his *oary* feet. *Addison.*
He more undaunted on the ruin rode,
And oared with labouring arms along the flood.

Pope.

Dr. Johnson sat high on the stern like a magnificent Triton. The boatman and Mr. M'Queen chorussed, and all went well. At length Malcolm himself took an *oar*, and rowed vigorously.

Bowell's Tour to the Hebrides.

OAR. That part of the oar which is out of the vessel and which enters the water, is called

the blade; and that which is within board is termed the loom, whose extremity, being small enough to be grasped by the rowers or persons managing the oars, is called the handle. To push the boat or vessel forwards, by means of this instrument, the rowers turn their backs forward, and, dipping the blade of the oar in the water, pull the handle forward, so that the blade at the same time may move aft in the water: but, since the blade cannot be so moved without striking the water, this impulsion is the same as if the water were to strike the blade from the stern towards the head: the vessel is therefore necessarily moved according to this direction. Hence it follows, that she will advance with the greater rapidity, by as much as the oar strikes the water more forcibly. Thus it is evident that an oar acts upon the side of a boat or vessel like a lever of the second class, whose fulcrum is the station upon which the oar rests on the boat's gunnel. In large vessels, this station is usually called the row-port; but in lighters and boats it is always termed the row-lock.

OARISTUS, or **OARISTYS**, a term in the Greek poetry, signifying a dialogue between a husband and his wife; such as that in the sixth book of the Iliad, between Hector and Andromache. Scaliger observes that the oaristus is not properly any particular little poem, or entire piece of poetry, but always a part of a great one. He adds that the passage now cited in Homer is the only proper oaristus extant in the ancient poets.

OASIS, the name of three districts of Egypt, so called from their fertility; the word oasis signifying 'a fertile spot in a sandy desert.' They produce barley, maize, dates, &c.

OAST, *n. s.* Belg. *ast*. A kiln. Not in use.

Empty the bin into a hog-bag, and carry them immediately to the *oast* or kiln to be dried.

Mortimer.

OAT, *n. s.* } Sax. *ate*, *aten*; from Goth.
OATCAKE, *n. s.* } *at*, *elte*, food. A grain largely
OATEN, *adj.* } used as food, both by men and
OAT-MALT, *n. s.* } horses: the plural, oats, is the
OAT-MEAL. } word more commonly used:
 eaten is made of, or bearing oats: the compounds
 explain themselves.

When shepherds pipe on *oaten* straws,
 And merry larks are ploughmen's clocks.

Shakespeare.

The *oats* have eaten the horses.

Id.

Take a blue stone they make haver or *oatcakes*
 upon, and lay it upon the cross bars of iron.

Peacham.

It is bare mechanism, no otherwise produced than
 the turning of a wild *oatboard*, by the insinuation of
 the particles of moisture.

Locke.

For your lean cattle, fodder them with barley
 straw first, and the *oat-straw* last.

Mortimer's Husbandry.

In Kent they brew with one-half *oatmeal*, and the
 other half barley-malt.

Mortimer.

Our neighbours tell me oft, in joking talk,
 Of ashes, leather, *oatmeal*, bran, and chalk.

Gay.

Oatmeal and butter, outwardly applied, dry the
 scab on the head.

Arruthnot on Ailments.

His horse's allowance of *oats* and beans was
 greater than the journey required.

Swift.

The *oat* is of the grass-leaved tribe; the flowers have
 no petals, and are disposed in a loose panicle: the

grain is eatable. The meal makes tolerable good
 bread.

Miller.

At breakfast this morning, among a profusion of
 other things, there were *oat-cakes*, made of what is
 called graddaned meal, that is, meal made of grain sepa-
 rated from the husks, and toasted by the fire, instead
 of being threshed and kiln dried.

Boswell's Tour.

His diet was of wheaten bread

And milk, and *oats*, and straw;

Thistles, or lettuces instead,

With sand to scour his maw.

Cowper.

The Friesland or Dutch *oat* affords more straw,
 and is thinner skinned than the above kind. The
 grains are mostly double, the larger one sometimes
 awned, with the awn placed high. It is not so much
 sown as formerly. The Siberian or Tartarian *oat*,
 &c., is considered by Mr. Marshall as a distinct spe-
 cies.

Dr. A. Rees.

OATES (Titus), a celebrated and infamous
 partizan, was born about 1619, and was the son
 of a Baptist preacher. He was educated at Mer-
 chant Tailor's school, whence he removed to Cam-
 bridge; took orders; and, according to Hume,
 became a chaplain on board the fleet, whence
 he was dismissed for unnatural practices. In
 1677 he turned Roman Catholic and Jesuit, to
 obtain, as he boasted, a knowledge of their se-
 crets with a view to betraying them; but subse-
 quently declared himself a Protestant, and, in
 conjunction with one Dr. Tongue, gave infor-
 mation of a pretended plot, for the destruction
 of the Protestant religion, and falsely accused the
 Catholic lords Petre, Powis, Bellasis, Arundel
 of Wardour, and other persons of quality, several
 of whom, including lord Stafford, were executed
 for the alleged conspiracy. Such was the cele-
 brated popish plot, and such the credulity of the
 times, that this unworthy character was rewarded
 with a pension of £1200 per annum, and lodged
 for safety at Whitehall palace. On the accession
 of James II., however, he was indicted and con-
 victed of perjury, and sentenced to stand in the
 pillory five times a year during his life, and to
 be whipped from Aldgate to Newgate, and
 thence to Tyburn. Though the whipping was
 severely inflicted, he recovered, and, at the Re-
 volution, the tide of popular prejudice again
 turning in his favor, he was rewarded with a
 pension of £1000 per annum. In 1698 he en-
 deavoured to rejoin the Baptists; but in the
 course of a few months was expelled as a hypo-
 crite. He died in 1705, universally execrated.

OATH, *n. s.*

Sax. *að*; Goth. *aith*;

OATHABLE, *adj.*

Belg. *ced*: as Mr.

OATHBREAKING, *n. s.* } Thomson suggests

from Sax. *de*, Goth. and Swed. *e*, law or justice.
 A solemn attestation of any kind: particularly
 one calling the Divine Being to witness or attest
 its truth: oath able is capable of taking an oath
 (obsolete): oathbreaking, perjury.

For men sweren bi a gretter than himsilf, and the
 ende of al her ple is an *oath* to confirmacyoun.

Wiclif. Ebrewis 6.

Read over Julia's heart, thy first best love,
 For whose dear sake thou then did'st rend thy faith
 Into a thousand *oaths*; and all those *oaths*
 Descended into perjury to love me.

Shakespeare.

You're not *oathable*,

Although I know you'll swear

Into strong shudders the immortal gods

Id.

His oathbreaking he mended thus,

By now forswearing that he is forsworn. *Id.*

We have consultations which inventions shall be published, which not: and take an *oath* of secrecy for the concealing of those which we think fit to keep secret. *Bacon.*

All the *oath*-rites said,
I then ascended her adorned bed.

Chapman.

Profit or pleasure there is none in swearing, nor any thing in men's natural tempers to incite them to it. For, though some men pour out *oaths* so freely as if they came naturally from them, yet surely no man is born of a swearing constitution. *Tillotson.*

Those called to any office of trust are bound by an *oath* to the faithful discharge of it: but an *oath* is an appeal to God, and therefore can have no influence, except upon those who believe that he is.

Swift.

Oaths terminate as Paul observes, all strife,
Some men have surely then a peaceful life;
Whatever subject occupy discourse,
The feats of Vestris, or the naval force,
Asseveration blustering in your face
Makes contradiction such a hopeless case;
In every tale they tell, or false or true,
Well known, or such as no man ever knew,
They fix attention, heedless of your pain,
With *oaths* like rivets forced upon the brain.

Cowper.

An *OATH* is an invocation of God to witness the truth of what we say, accompanied by an implied and sometimes expressed imprecation of his vengeance, or a renunciation of his favor, if what we affirm be false, or what we promise be not performed. The laws of all civilised states have required the security of an *oath* for evidence given in a court of justice; and the Christian religion, while it utterly prohibits profane and needless swearing, does not seem to forbid *oaths* duly required, or taken on necessary occasions.

The Quakers and Moravians, swayed by the sense which they put upon that text of Scripture (Matth. v. 34), 'swear not at all;' and St. James's words, chap. v. 12, refuse to swear upon any occasion, even at the requisition of a magistrate, and in a court of justice. These scruples appear to proceed from not distinguishing between the proper use and abuse of swearing. It is doubtless impious to call upon God to witness trifles, or to use his tremendous name as a mere expletive in conversation; but it does not follow that we may not solemnly call upon him to witness truths of importance. If it be lawful to ask of God our daily bread, and other earthly blessings, it cannot surely be unlawful, where the lives or properties of our neighbours, or the security of government is concerned, to invoke him with reverence to witness the truth of our assertions, or the sincerity of our intentions; because of our truth and sincerity, in doubtful cases, none but he can be the witness.

In the Old Testament we find frequent mention made of *oaths* taken and imposed:—Gen. xxiv. Abraham made Eliezer, his steward, swear by the Lord, the God of heaven and earth.—Gen. xxvi. Abimelech, king of Gerar, and Isaac, took an *oath* of each other.—Gen. l. Joseph made his brethren swear.—Exod. xxii. An *oath* was ordered by God to be imposed on one who

should lose cattle committed to his care.—1 Sam. xiv. Saul imposed an *oath* on his subjects.

In the New Testament we are told that 'an *oath* for confirmation is an end of all strife.'—Heb. vi. 16. Our blessed Saviour himself, who came not to destroy the law, but to fulfil it, 'submitted to be put on his *oath* by Caiaphas, the Jewish high priest, before which adjuration he held his peace.'—Matt. xxvi. 63. St. Paul uses language which, without controversy, must be held to be equivalent with the most solemn *oath*. 'I call God for a record upon my soul.'—2 Cor. i. 23.

The swearing which we think lawful is—1. When the occasion is important; 2. When the necessity is urgent; 3. When the truth is not attainable without it, the matter being involved in obscurity; 4. When the evidence is contradictory; or, 5. When any evil would arise from the neglect, or good from the use, of it—as the escape of the guilty and the punishment of the innocent; or the punishment of the bad, and the acquittal of the innocent.

The *oaths* which we consider to be prohibited are—1. Vain or useless; 2. Frequent or customary; 3. Profane or idolatrous; 4. Rash or heedless; 5. False or deceitful; nor do we allow it to be proper to swear at all, by any other person, place, thing, time, or object than God only. And hence we understand our Saviour and his apostle James not as absolutely forbidding all swearing, but all swearing by heaven or earth, sun or moon, life or limb, man or angel, or other animate or inanimate thing, in those often quoted, but often misunderstood passages, Matt. v. 34; James v. 12. As the original Greek was without stops, the above passages might with equal, if not greater propriety, have been rendered, 'Swear not at all by heaven,' &c.; or 'Swear not at all, either by heaven,' &c.; or, perhaps, still better, 'Neither swear not at all by heaven,' &c. That this was the sense of the reformers, and the compilers of our Common Prayer Book, may be seen in 'The Fathers of the English Church,' *passim*; and in the thirty-ninth article of our church:—'As we confess that vain and rash swearing is forbidden Christian men, by our Lord Jesus Christ, and James his apostle, so we judge that (the) Christian religion doth not prohibit, but a man may swear when the magistrate requireth, in a cause of faith and charity, so it be done according to the prophet's (Jeremiah iv. 2) teaching, in justice, judgment, and truth.'

They who defend the lawfulness of *oaths* say, 1. *Oaths were permitted under the law, which Christ came not to destroy but to fulfil.* The Friends reply, so were arbitrary divorce, hatred of enemies, retaliation, &c.; the same discourse which forbade these forbade swearing also, and in terms at least equally explicit. Swear not at all (ὅλως, omnino, altogether). In this first gospel sermon, the axe (as had been predicted) was laid at the root of the tree of evil; anger was forbidden, as the root of murder; unlawful desire, as that of adultery; and so swearing, as the root of perjury. 'Christ,' says Basil, 'cuts off the opportunity of perjury.'

2. *Our Lord and the apostle Paul swore.*—The Friends reply, When our blessed Redeemer was brought before the sanhedrim, the high priest said,

'I adjure thee by the living God,' &c.; to which Jesus replied, 'Thou hast said.' If this was an oath, it was evidently all on the part of Caiaphas, our Lord had no agency in it. But for three reasons we do not consider it one. 1st, *Ἐπεμύνη*, though translated 'adjure,' means rather to solemnly exhort and enjoin, as Schleusner himself allows. 2nd, If the high priest had wished to put our Saviour on his oath, it would doubtless have been done in the ordinary form. But, 3rd, It is not likely that he was sworn at all. He was not attending the court as a witness, neither was there any fact to which he was called upon to depose. He was accused of having assumed the divine character; the evidence was suspicious and unsatisfactory, and it was evidently for the purpose of entrapping him into the repetition of his supposed crime, that the high priest solemnly enjoined him to declare whether he was or was not the Son of God.

With respect to the apostle Paul, no expression, they continue, can be extracted from his writings which would be admitted for an oath in any court of judicature. Similar protestations were frequently made by primitive Friends, but unavailingly, and the affirmation granted them by law used to contain the words 'in the presence of Almighty God.' Besides, this argument would prove, if it proved any thing, too much, for the advocates of oaths generally, allow that only juridical swearing is admitted by the law of Christ, which Paul must have transgressed in his oaths, as they were made in epistles to his friends.

3. The third argument in defence of oaths is that Matthew v. 33—37, and James v. 12, may be translated 'Swear not at all, either by heaven,' &c., not including 'by Jehovah.' This interpretation, reply the Friends, though philologically almost groundless, we will grant; but while these words remain, 'or by any other oath,' of what service can it be? It is very strange that any one should fail to perceive that these oaths (by heaven, by earth, &c., and specified because most common) were forbidden for this very reason, that even they, virtually and in fact, were oaths by Jehovah himself. This reason is most explicitly given by our Lord, 'Swear not at all; neither by heaven, for it is God's throne; nor by the earth, for it is his footstool; neither by Jerusalem, for it is the city of the Great King, &c.' 'Whoso shall swear by the temple, sweareth by it and by Him that dwelleth therein; and he that shall swear by heaven, sweareth by the throne of God and by Him that sitteth thereon; so that swearing by heaven and by God is the same thing. If then one is unlawful, the other must be so also. And, if swearing by any thing created was forbidden simply because of its virtual connexion with swearing by the Creator, how much more offensive to that Great Being must be the oath by his own awful name! The Friends observe further, and in conclusion, that for nearly 300 years after Christ, oaths were considered contrary to his command.

They also quote from Tertullian, 'swearing itself is unlawful to Christians,' and from Chrysostom, 'Let the Christian entirely avoid oaths, in obedience to our Lord's prohibition.' Vide *Gurney on the Peculiarities of Friends.*

OATS, in botany. See *AVENA*.

OAXACA, or GUAXACA, a fertile and beautiful intendency of Mexico, bounded on the north by Vera Cruz, on the east by Guatemala, on the west by the province of Puebla, and on the south, for eleven leagues, by the Pacific Ocean. The air is fine, and the vegetation so beautiful and vigorous that it produces more mulberry trees and more silk than any province in America; together with wheat, cattle, sugar, cotton, honey, cocoa, and plantains. In the temperate region the rivers are very copious from the month of May to the month of October. Yet, except the valley of Guaxaca, the greatest part of the country is mountainous. It has rich mines of gold, silver, and lead; and all its rivers have gold in their sands. Cassava, cochineal, crystal, and copperas, abound in this province; as also vanilla, a drug used to give chocolate a flavor. In 1803 the inhabitants amounted to 534,000; the extent of surface in the province is 4447 square leagues.

OAXACA, the capital of the last mentioned province, and a bishop's see, lies 230 miles south of the city of Mexico, in a delightful valley of this name. It is watered by a beautiful river, and on the north several aqueducts bring pure and abundant waters from the mountains. The climate presents a perpetual spring. The town is an oblong square, nearly two miles by one and a quarter, including the suburbs, which are full of gardens and plantations of cochineal. The streets are wide and well paved; and the houses, generally but of two floors, are of freestone. The modern town-house in the great square is built with a sea-green stone. The bishop's house and the cathedral form two sides of the same square, which is surrounded with arcades. The churches and monasteries, which are numerous, are all solidly built, and handsomely decorated. From the enumeration made in 1792, it appears that the inhabitants amount to 24,000. Oaxaca is greatly subject to earthquakes.

OBADIAH, Heb. *עבדי* and *יח*, i. e. the servant of the Lord, a valiant man of David's army, who came to join him in the wilderness, with several others of the tribe of Gad, 1 Chron. xii. 9.

OBADIAH, the prophet, is believed to have been the same with the governor of Ahab's house, mentioned in the first book of Kings (xviii. 3, &c.), who hid and fed the hundred prophets whom Jezebel would have destroyed; and some say that he was that Obadiah whom Josiah made overseer of the works of the temple (2 Chron. xxxiv. 12.) The truth is, that when he lived or prophesied is very uncertain: though most writers make him contemporary with Hosea, Amos, and Joel.

OBADIAH, THE PROPHECY OF, a canonical book of the Old Testament, which is contained in one single chapter; and is partly an invective against the cruelty of the Edomites, who mocked and derided the children of Israel as they passed into captivity; and with other enemies, their confederates, invaded and oppressed those strangers, and divided the spoil among themselves; and partly a prediction of the deliverance of Israel, and of

the victory and triumph of the whole church over her enemies.

OBDORE, a name formerly given to that part of Asiatic Russia which extends along the mountainous northern part of the course of the Obi, to the Frozen Ocean. The soil is here destitute of wood, and covered only here and there with a few shrubs. Every attempt to introduce plants, vegetables, or domestic animals, has failed: a horse seldom lives more than one year, and a cow not more than five; here rein deer form, therefore, the only resource of the country. The summer, however, is agreeable.—This is also the name of a small palisadoed fort, the most northerly of any maintained by Russia, garrisoned by twenty-five cossacks and an officer, who forms a species of sovereign to the tribes of Ostiaks and Samoyedes. The town consists only of a church and five houses, with a number of huts, which serve as magazines for furs collected as a tribute. Lat. 67° N.

OBDUCE, *v. a.* } Lat. *obduco*. To draw over
OBDUCTION, *n. s.* } as a covering.

No animal exhibits its face in the native colour of its skin but man; all others are covered with feathers, hair, or a cortex that is *obduced* over the cutis.

Hale.

OB'DURATE, *adj.* } Lat. *obduratus*. Hard
OB'DURACY, *n. s.* } in heart; obstinate;
OB'DURATELY, *adv.* } impenitent; stub-
OB'DURATENESS, *n. s.* } born; firm: obduracy
OB'DURATION, *n.* } is inflexibility; impenitence; state of being
OB'DURATED, *adj.* } firm in evil. All the other derivatives follow these senses.

Sometimes the very custom of evil makes the heart *obdurate* against whatsoever instructions to the contrary.

Hooker.

What occasion it had given them to think, to their greater *obduration* in evil, that, through a froward and wanton desire of innovation, we did constrainedly those things for which conscience was pretended?

Id.

Thou think'st me as far in the Devil's book, as thou and Falstaff, for *obduracy* and persistency.

Shakespeare. Henry IV.

If when you make your prayers, God should be so *obdurate* as yourselves, How would it fare with your departed souls?

Shakespeare.

Women are soft, mild, pitiful, and flexible; Thou stern, *obdurate*, flinty, rough, remorseless.

Id.

To what a height of *obduration* will sin lead a man, and, of all sins, incredulity.

Bp. Hall.

I confess finding the *obduredness* of that man, I bent my prayers against him, beseeching God daily that he would be pleased to remove, by some means or other, that apparent hinderance to my faithful labours.

Id.

This barren season is always the reward of obstinate *obduration*.

Hammond.

To convince the proud what sins avail, Or wonders move the *obdurate* to relent; They hardened more, by what might more reclaim.

Id.

This saw his hapless foes, but stood *obdured*, And to rebellious fight rallied their powers Insensate.

Id. Paradise Lost.

God may, by a mighty grace, hinder the absolute completion of sin in final *obduracy*.

South.

No such thought ever strikes his marble, *obdurate* heart, but it presently flies off and rebounds from it. It is impossible for a man to be thorough paced in ingratitude, till he has shook off all fetters of pity and compassion.

South.

Obdurate as you are, oh! hear at least

My dying prayers, and grant my last request.

Dryden.

They joined the most *obdurate* consonants without one intervening vowel.

Swift.

And if he doom that people with a frown.

And mark them with a seal of wrath pressed down, *Obduracy* takes place; callous and tough,

The reprobated race grows judgment-proof. *Courper.*

OBE'DIENCE, *n. s.* } Fr. *obedience*; Lat.

OBE'DIENT, *adj.* } *obedientia*. Conform-

OBE'DIENTIAL, *adj.* } ity to command; sub-

OBE'DIENTLY, *adv.* } mission to authority;

OBEY, *v. a.* } hence obsequiousness:

obedient and obdiential mean, compliance with command or authority; submissive; obsequious: to obey is, actively or passively to comply with commands; conform to the requirements of authority. It formerly took *to* before the person obeyed, which Addison has mentioned as one of Milton's Latinisms; but it is frequent, as Dr. Johnson observes, in old writers: when we borrowed the French word we borrowed the syntax, *obeir au roi*!

His servants ye are to whom ye *obey*, whether of sin unto death, or of *obedience* unto righteousness.

Rom. iv. 16.

To this end did I write, that I might know the proof of you, whether ye be *obedient* in all things.

2 Cor. ii. 9.

He commanded the trumpets to sound, to which the two brave knights *obeying*, they performed their courses, breaking their staves.

Sidney.

The fit bark, *obeying* to her mind,

Forth launched quickly, as she did desire.

Spenser.

If you violently proceed against him, it would shake in pieces the heart of his *obedience*.

Shakespeare.

The will of Heaven

Be done in this and all things! I *obey*. *Id.*

To this her mother's plot

She, seemingly *obedient*, likewise hath

Made promise. *Id. Merry Wives of Windsor.*

It was both a strange commission, and a strange *obedience* to a commission, for men so furiously assailed to hold their hands.

Bacon.

The ancient Britons yet a sceptred king *obeyed*.

Dryden.

We must beg the grace and assistance of God's spirit to enable us to forsake our sins; and to walk in *obedience* to him.

Duty of Man.

Never any man lost by his *obedience* to the Highest.

Bp. Hall.

Faith is such as God will accept of, when it affords fiducial reliance on the promises, and *obediential* submission to the command.

Hammond.

In vain thou bid'st me to forbear,

Obedience were rebellion here.

Cowley.

Nor did they not perceive the evil plight

In which they were, or the fierce pains not feel,

Yet to their general's voice they soon *obeyed*.

Milton.

Nor can this be,

But by fulfilling that which thou didst want,

Obedience to the law of God, imposed

On penalty of death.

Id. Paradise Lost.

Religion hath a good influence upon the people,
to make them obedient to government, and peaceable
one towards another.

Tillotson.

We should behave ourselves reverently and obediently
towards the Divine Majesty, and justly and charitably
towards men.

Id.

Africa and India shall his power obey,
He shall extend his propagated way
Beyond the solar year, without the starry way.

Dryden.

Faith is then perfect, when it produces in us a
fiducial assent to whatever the gospel has revealed,
and an obediential submission to the commands.

Wake's Preparation for Death.

The chief his orders gives; the obedient band,
With due observance, wait the chief's command.

Pope.

The obedience of men is to imitate the obedience of
angels, and rational beings on earth are to live unto
God as rational beings in heaven live unto him.

Law.

The stout tall captain, whose superior size
The minor heroes view with envious eyes,
Becomes their pattern upon whom they fix
Their whole attention, and ape all his tricks;
His pride, that scorns to obey or to submit,
With them is courage, his effrontery wit.

Cowper.

OBELIRNE (Thomas Lewis), D. D., a learned
prelate of the established church, and a native of
the county of Longford, in Ireland, was born in
1748 of a Catholic family, by whom he was sent
to St. Omers at an early age, with his brother
John, to study for the priesthood. John in due
course took orders and became a Catholic priest
in the diocese of which his brother was afterwards
the Protestant bishop. Thomas, on the contrary,
renounced the Catholic creed, and at the
commencement of the American war, having
taken orders, accompanied lord Howe as chaplain
of the fleet. On his return to England he
published a vindication of his patron, whose
conduct was at that time a subject of parliamentary
enquiry; and his connexion with that noble
family introduced him to the duke of Portland.
In 1782 he accompanied the duke to Ireland, as
private secretary, and obtained, the following
year, from his grace, two valuable livings in Northumberland
and Cumberland. He afterwards
was first chaplain to earl Fitzwilliam, and was
promoted to the see of Ossory, from which, on
the death of Dr. Maxwell, he was translated to
that of Meath. The writings of this popular prelate
were, *The Crucifixion*, a poem, in 4to. 1776;
The Generous Impostor, a comedy, 1780; *A Short History of the last Session of Parliament*,
8vo., anonymous; *Considerations on the late Disturbances*,
by a Consistent Whig, 8vo.; *Considerations on the Principles of Naval Discipline and Courts-Martial*,
8vo., 1781; and several sermons and charges. He died February 15th, 1823.

OBESANCE, *n. s.* *Fr. obeissance.* A bow; a courtsey; an act of reverence.

Bathsheba bowed, and did obeissance unto the king.

1 Kings i. 16.

Bartholomew my page,
See drest in all suits like a lady;
Then call him Madam, do him all obeissance.

Shakspeare.

The lords and ladies paid
Their homage, with a low obeissance made;
And seemed to venerate the sacred shade.

Dryden.

OBELISK, *n. s.* *Lat. obeliscus; Gr. οβελος.*
A pyramidal piece or pillar of marble, or other
fine stone, having usually four faces.

He published the translation of the Septuagint,
having compared it with the Hebrew, and noted by
asterisks what was defective, and by obelisks what
redundant.

Grew.

Between the statues obelisks were placed,
And the learned walls with hieroglyphicks graced.

Pope.

An OBELISK, in architecture, is a truncated
quadrangular, and slender pyramid, raised as an
ornament, and frequently charged either with inscriptions
or hieroglyphics. Obelisks appear to be of very great antiquity,
and to have been first raised to transmit to posterity precepts of philosophy,
which were cut in hieroglyphical characters; afterwards they were used to immortalise
the great actions of heroes, and the memory of persons beloved.
The first obelisk mentioned in history was that of Ramases king of Egypt,
in the time of the Trojan war, which was forty cubits high.
Phius, another king of Egypt, raised one of fifty-five cubits;
and Ptolemy Philadelphus another of eighty-eight cubits, in memory of Arsinoe.
Augustus erected one at Rome in the Campus Martius, which served to mark the hours on an horizontal dial drawn on the pavement.
They were called by the Egyptian priests the fingers of the sun, because they were made in Egypt also to serve as styles or gnomons to mark the hours on the ground.
The Arabs still call them Pharaoh's needles; whence the Italians call them *aguglia*, and the French *aiguilles*.
One of the most common and frequent situations in which obelisks were erected was the space before a temple.
Diodorus makes mention of two obelisks of Sesostris placed before a Theban temple, which were 120 cubits high.
Herodotus mentions two others, 100 cubits high, one of which was erected before a temple at Sais, and the other before the temple of the sun at Heliopolis.

The Romans, in the plenitude of their power and splendor, removed many of these relics of times, then ancient, from their original situations into Italy.
When that majestic empire was overrun by the barbarians most of these noble monuments were thrown down, defaced, or demolished.
The exhumations made by the decree of pope Sextus V. brought to light four of them, which were repaired by his architect, Fontana.
Since that period several others have been dug up. Several obelisks have likewise been preserved at Constantinople, the most celebrated of which stood in that part of the hippodrome denominated *Media Spina*.
On the four sides of the base of this noble monument were sculptured a variety of subjects: the bassi-relievi of the northern side have been published by Spon.
At Catania, in Sicily, fragments have been discovered of two Egyptian obelisks, most probably conveyed thither by the Romans.
One has been set up again, presenting a curious appearance from its having eight faces. On the north side of Penrith, in the church-yard, are two square obelisks, of a single stone each, eleven or twelve feet high, about twelve inches diameter, and twelve by eight at the sides; the highest about eighteen

suches diameter, with something like a transverse piece to each, and mortised into a round base. They are fourteen feet asunder, and between them is a grave enclosed between four semicircular stones of the unequal lengths of five, six, four and a half, and two feet high, having on the out-sides rude carving, and the tops notched. This is called the Giant's grave, and ascribed to Sir Ewan Cesarius, who is said to have been as tall as one of the columns, and capable of stretching his arms from one to the other.

OBERLAND, a district of Switzerland, forming the south-east part of the canton of Bern. In the north is a lofty mountain; but the district contains large valleys and plains, which are fertile in fruit and corn. Towards the south it becomes more and more hilly, and terminates in the highest region of the Alps.

OBERLIN (Jer. James), a learned German philosopher and metaphysician, was born at Strasburgh in 1735. He studied at his native place, where in 1757 he published his *Dissertatio Philologica de veterum ritu condiendi Mortuos*. After this he contributed assistance to Dr. Ken- nicot, by collating for him four MSS. in the Strasburgh library. In 1763 he was appointed librarian to the university, and in 1770 became professor of Latin eloquence. In 1782 he obtained the chair of logic and metaphysics. He died in 1806. His other works are—1. *Rituum Romanorum primæ Linæ, orbis antiqui, Artis Diplomatiæ, &c.*; 2. *Jungendorum Marium Fluminumque Omnis ævi Molimina*; 3. *De Latine Lingue Medii ævi mira Barbaria*; 4. *Essai sur le patois Lorrain*; 5. *Glossarium Germanicum Medii ævi, Potissimum Dialecti Suevicæ*; 6. *The Strasburgh Almanac*; 7. *Editions of Horace, Tacitus, Cæsar, &c.*; 8. *Life of Guttenberg, &c.*

OBESENESS, *n. s.* } *Lat. obesus. Morbid*
OBESITY. } *fatness; incumbrance*
of flesh.

On these many diseases depend; as, on the strait-ness of the chest, a phthisis; on the largeness of the veins, an atrophy; on their smallness, *obesity*.

Grew's Cosmol.

OBI, a considerable river of Asiatic Russia, traversing the whole government of Tobolsk. It is said to rise in 52° N. lat. on the south side of the Altai Mountains, from the lake Altyn Noor. Here it is called By, but formerly received the name of the Great River, as being the largest which flows through Asiatic Russia. It takes the name of Obi after its junction with the Katoune: after receiving the Irtysh, it becomes very broad: but it divides into branches, which again re-unite and form numerous isles. This river has an entire course of upwards of 2000 miles, and every where abounds in fish.

OBIAN, a river of the United States, in Tennessee, which runs into the Mississippi, long. 90° 8' W., lat. 35° 48' N.

OBIIDOS, a town in the central part of Portugal, near the coast on the small river Lagoa de Obidos. On an adjoining hill are the ruins of a castle. An action took place here between the British advanced guard and a party of French, on 15th August, 1808, shortly before the battle of Vimeira. Inhabitants 3000. Forty-four miles north of Lisbon.

OBJECT, *n. s. & v. a.*
OBJECT-GLASS, *n. s.*
OBJECTION,
OBJECTIVE, *adj.*
OBJECTIVELY, *adv.*
OBJECTIVENESS, *n. s.*
OBJECTOR.

Fr. objet; Lat. objectum, i. e. ob and jacio, to cast against. That against or toward which the sight is cast, or any power or faculty

employed; hence any thing presented to the senses; any thing influenced by another thing: to object is, therefore, to oppose; propose as a change; taking to or against after it: objection, the act of presenting any thing opposed; charge made; adverse argument or fault found: objective is belonging to, residing in, or made an object: objectively, in the manner or state of an object: objectiveness, the state of being an object: objector, he who offers or sustains objections.

Were it not some kind of blemish to be like unto Infidels and Heathens, it would not so usually be objected; men would not think it any advantage in the cause of religion to be able therewith justly to charge their adversaries.

Hooker.

The book requireth due examination, and giveth liberty to object any crime against such as are to be ordered.

Whitgifts.

Dishonour not your eye
By throwing it on any other object.

Shakspeare.

Pardon
The flat unraised spirit, that hath dared,
On this unworthy scaffold, to bring forth
So great an object. *Id. Henry V*

Speak on, Sir,
I dare your worst objections.

Id. Henry VIII.

Men in all deliberations find ease to be of the negative side, and affect a credit to object and foretell difficulties; for when propositions are denied, there is an end of them; but if they be allowed, it requireth a new work; which false point of wisdom is the bane of business.

Bacon.

Flowers growing scattered in divers beds, will show more so as that they be object to view at once.

Id.

There is ever between all estates a secret war. I know well this speech is the objection and not the decision; and that it is after refuted.

Id.

They are her farthest reaching instrument,
Yet they no beams unto their objects send;
But all the rays are from their objects sent,
And in the eyes with pointed angles end.

Davies.

I find our weak powers are subject to an unavoidable lassitude; and we can no more contemplate always those divine objects than our bodily eyes are able to fix themselves on the body of the sun in his brightest splendour.

Bp. Hall.

The object of true faith is, either God himself, or the word of God: God who is believed in, and the word of God as the rule of faith, or matter to be believed.

Hammond.

The old truth was, object ingratitude, and ye object all crimes: and is it not as old a truth, is it not a higher truth, object rebellion, and ye object all crimes?

Holiday.

Why else this double object in our sight,
Of sight pursued in the air, and o'er the ground?

Milton.

If this one small piece of nature still affords new matter for our discovery, when should we be able to search out the vast treasures of objective knowledge that lie within the compass of the universe?

Hale's Origin of Mankind.

Is there such a motion of *objectiveness* of external bodies, which produceth light? The faculty of light is fitted to receive that impression or *objectiveness*, and that *objectiveness* fitted to that faculty. *Id.*

The accusative after a verb transitive, or a sentence in room thereof, is called, by grammarians, the *object* of the verb. *Clarke.*

The basilisk should be destroyed, in regard he first receiveth the rays of his antipathy and venomous emission, which *objectively* move his sense. *Browne.*

The act of faith is applied to the *object* according to the nature of it; to what is already past, as past; to what is to come, as still to come; to that which is present, as it is still present. *Pearson.*

Truth is the *object* of our understanding, as good is of the will. *Dryden's Dufrenoy.*

It was *objected* against a late painter that he drew many graceful pictures, but few of them were like. *Id.*

This may fitly be called a determinate idea, when, such as it is at any time *objectively* in the mind, it is annexed, and without variation determined to an articulate sound, which is to be steadily the sign of that same *object* of the mind. *Locke.*

I have shewn your verses to some, who have made that *objection* to them. *Walsh's Letters.*

This the adversaries of faith have too much reason to *object* against too many of its professors; but against the faith itself nothing at all. *Sprat.*

Those things in ourselves, are the only proper *objects* of our zeal, which, in others, are the unquestionable subjects of our praises. *Id.*

Whoever makes such *objections* against an hypothesis hath a right to be heard, let his temper and genius be what it will. *Burnet.*

Others *object* the poverty of the nation, and difficulties in furnishing greater supplies. *Addison.*

An *objectglass* of a telescope I once mended, by grinding it on pitch with putty, and leaning easily on it in the grinding, lest the putty should scratch it. *Newton's Optics.*

But these *objectors* must the cause upbraid,
That has not mortal man immortal made. *Blackmore.*

There was but this single fault that Erasmus, though an enemy, could *object* to him. *Atterbury.*

This passenger felt some degree of concern at the sight of so moving an *object*, and therefore withdrew. *Id.*

Let the *objectors* consider, that these irregularities must have come from the laws of mechanism. *Bentley.*

Pallas to their eyes
The mist *objected*, and condensed the skies. *Pope.*

Certainty, according to the schools, is distinguished into *objective* and subjective. *Objective* certainty is when the proposition is certainly true in itself; and subjective, when we are certain of the truth of it. The one is in things, the other in our minds. *Watts's Logick.*

As you have no mistress to serve, so let your own soul be the *object* of your daily care and attendance. *Law.*

Refined sense, and exalted sense be not so useful as common sense; their rarity, their novelty, and the nobleness of their *objects*, make some compensation, and render them the admiration of mankind, as gold, though less serviceable than iron, acquires from its scarcity a value which is much superior. *Hume.*

OBT. It signifies a funeral solemnity, or office for the dead, most commonly performed

Vol. XVI.

when the corpse lies in the church uninterred. The anniversary of any person's death was also called the obit; and to observe such day with prayers and alms, or other commemoration, was the keeping of the obit. In religious houses they had a register, wherein they entered the obits or obituary days of their founders and benefactors; which was thence termed obituary. The tenure of obit or chantry lands is taken away and extinct by 1 Edward VI. c. 14, 15, and Car. II. c. 9.

OBJURGATE, *v. a.* } Lat. *objurgo*. To
OBJURGATION, *n. s.* } chide or reprove.
OBJURGATORY, *adj.*

If there be no true liberty, but all things come to pass by inevitable necessity, then what are all interrogations and *objurgations*, and reprehensions and expostulations? *Bramhall.*

OBLATE, *adj.* Lat. *oblatus*. Flatted, as a globe at the poles.

By gravitation bodies on this globe will press towards its center, though not exactly thither, by reason of the *oblate* spheroidal figure of the earth, arising from its diurnal rotation about its axis. *Cheyne's Philosophical Principles.*

An **OBLATE SPHEROID** has its axis shorter than its middle diameter, being formed by the rotation of an ellipse about the shorter axis.

OBLATI, Lat., in church history, secular persons who devoted themselves and their estates to some monastery, into which they were admitted as a kind of lay brothers. The form of their admission was putting the bell-ropes of the church round their necks as a mark of servitude. They wore a religious habit, different from that of the monks.

OBLATION, *n. s.* Fr. *oblation*; Lat. *oblatus*. An offering; sacrifice, or any thing connected with religious worship.

She looked upon the picture before her, and straight sighed, and straight tears followed, as if the idol of duty ought to be honoured with such *oblations*. *Sidney.*

Many conceive in the *oblation* of Jephtha's daughter, not a natural but a civil kind of death, and a separation from the world. *Browne.*

The kind *oblation* of a falling tear. *Dryden.*
The will gives worth to the *oblation*, as to God's acceptance, sets the poorest giver upon the same level with the richest. *South.*

Behold the coward, and the brave,
All make *oblations* at this shrine. *Swift.*

OBLIGATE, *v. a.* } Fr. *obligation*; Lat.
OBLIGATION, *n. s.* } *obligo*. Obligate and
OBLIGATORY, *adj.* } oblige are both used
OBLIGATE, *v. a.* } for to bind or compel
OBLIGEE, *n. s.* } by contract, duty, or
OBLIGEMENT, } gratitude; and the latter
OBLIGER, } for to please; gratify: obligation is the
OBLIGING, *part. adj.* } binding power; con-
OBLIGINGLY, *adv.* } tract; act; engage-
OBLIGINGNESS, *n. s.* } ment, or favor: obligatory, imposing or conveying obligation; coercive; used with *to* or *on*: obligee is the person bound by an obligation: the obliger, he who binds: obligement (from the Fr. *obligement*), synonymous with obligation: obliging, compliant; complaisant; urbane; engaging: obligingly, civilly; complaisantly: obligingness, force; obligation: civility; urbanity.

It is safer to affront some people than to *oblige* them; for the better a man deserves the worse they will speak of him, as if the possessing of open hatred to their benefactors were an argument that they lie under no *obligation*. *Sidney.*

Whatever we owe it is our part to find where to pay it; for, whether the *obliger* be good or bad, the debt is still the same. *Id.*

Your father lost a father;
That father his; and the survivor bound
In filial *obligation*, for some term,

To do obsequious sorrow. *Shakspeare. Hamlet.*

There was no means for him as a Christian to satisfy all *obligations* both to God and man, but to offer himself for a mediator of an accord and peace.

Bacon's Henry VII.

And concerning the lawfulness, not only permissively, but whether it be not *obligatory* to Christian princes and states. *Bacon.*

This doom though reversible by the tribunal of heaven is still *obligatory* on earth. *Bp. Hall.*

I will not resist, whatever it is, either of divine or human *obligement*, that you lay upon me.

Milton's Education.

The heir of an obliged person is not bound to make restitution, if the *obligation* passed only by a personal act; but, if it passed from his person to his estate, then the estate passes with all its burthen.

Taylor's Rule of Holy Living.

As long as the law is *obligatory*, so long our obedience is due. *Id.*

Nothing can be more reasonable than that such creatures should be under the *obligation* of accepting such evidence as in itself is sufficient for their conviction. *Wilkins.*

Obligation is thralldom, and thralldom is always hateful. *Hobbes.*

He that depends upon another, must
Oblige his honour with a boundless trust.

Waller.

Religion *obliges* men to the practice of those virtues which conduce to the preservation of our health.

Tillotson.

The better to satisfy this *obligation*, you have early cultivated the genius you have to arms. *Dryden.*

Vain wretched creature, how art thou misled,
To think thy wit these godlike notions bred!
These truths are not the product of thy mind,
But dropt from heaven, and of a nobler kind:
Revealed religion first informed thy sight,
And reason saw not, till faith sprung the light.
Thus man by his own strength to heaven would soar,
And would not be *obliged* to God for more. *Id.*

Let this fair princess but one minute stay.

A look from her will your *obligements* pay. *Id.*

Where is the *obligation* of any man's making me a present of what he does not care for himself?

L'Estrange.

Nothing could be more *obliging* and respectful than the lion's letter was, in appearance; but there was death in the true intent. *Id.*

Some natures are so sour and so ungrateful that they are never to be *obliged*. *Id.*

Nobody is under an *obligation* to know every thing: knowledge and science in general is the business only of those who are at ease and leisure.

Locke.

A great man gets more by *obliging* his inferior, than by disdaining him; as a man has a greater advantage of sowing and dressing his ground than he can have by trampling upon it. *South.*

The church hath been thought fit to be called Catholic, in reference to the universal obedience which it prescribeth; both in regard to the persons, *obliging* men of all conditions, and in relation to the precepts,

requiring the performance of all the evangelical commands. *Pearson.*

They look into them not to weigh the *obligingness*, but to quarrel with the difficulty of the injunctions: not to direct practice, but excuse prevarications.

Decay of Piety.

Happy the people who preserve their honour
By the same duties that *oblige* their prince!

Addison's Cato.

Monseigneur Strozzi has many curiosities, and is very *obliging* to a stranger who desires the sight of them. *Addison.*

Eugenius informs me very *obligingly*, that he never thought he should have disliked any passage in my paper. *Id.*

The law must *oblige* in all precepts, or in none. If it *oblige* in all, all are to be obeyed; if it *oblige* in none, it has no longer the authority of a law.

Rogers.

No ties can bind that from constraint arise,
Where either's forced, all *obligation* dies.

Granville.

To those hills we are *obliged* for all our metals, and with them for all the conveniencies and comforts of life. *Bentley.*

When interest calls off all her sneaking train,

When all the' *obliged* desert, and all the vain,

She waits or to the scaffold or the cell. *Pope.*

Obliging creatures! make me see

All that disgraced my betters, met in me. *Id.*

So *obliging* that he ne'er *obliged*. *Id.*

A people long' used to hardships look upon themselves as creatures at mercy, and that all impositions laid upon them by a stronger hand are legal and *obligatory*. *Swift.*

If this patent is *obligatory* on them, it is contrary to acts of parliament and therefore void. *Id.*

I see her taste each nauseous draught,
And so *obligingly* am caught;
I bless the hand from whence they came,
Nor dare distort my face for shame.

Id. Miscellanies.

A man who owes a little can clear it off in a very little time; whereas a man who, by long negligence owes a great deal, despairs of being ever able to discharge the *obligation*, and therefore never looks into his accounts at all. *Chesterfield.*

OBLIGATION, in law, signifies a bond, wherein is contained a penalty, with a condition annexed for the payment of money, &c. The difference between it and a bill is, that the latter is generally without a penalty or condition, though it may be made *obligatory*; and obligations are sometimes, by matter of record, as statutes and recognizances.

OBLIQUATION, *n. s.* Lat. *obliquatio*, from *obliquus*. Declination from straightness or perpendicularity; obliquity.

The change made by the *obligation* of the eyes, is less in colours of the densest than in thin substances. *Newton's Optics.*

OBLIQUE', *adj.*

OBLIQUE'LY, *adv.*

OBLIQUE'NESS, *n. s.*

OBLIQUITY.

Fr. *oblique*; Lat. *obliquus*. Sideways; transverse; not direct or perpendicular; not parallel;

applied to all the cases of nouns beside the nominative: obliqueness and obliquity both mean deviation from rectitude either lineal or moral.

Has he given the lie

In circle or *oblique* or semicircle,

Or direct parallel you must challenge him.

Shakspeare.

All is *oblique*,
There is nothing level in our cursed nature .
But direct villany. *Id.*

One by his view
Mought deem him born with ill-disposed skies,
When *oblique* Saturn sat in the house of the agonies. *Spenser.*

There is in rectitude, beauty; as contrariwise in
obliquity, deformity. *Hooker.*

If sound be stopped and repercussed, it cometh
about on the other side in an *oblique* line. *Bacon.*

Which else to several spheres thou must ascribe,
Moved contrary with thwart *obliquities*. *Milton.*

Count Rhodophill, cut out for government and
high affairs, and balancing all matters in the scale of
his high understanding, hath rectified all *obliquities*. *Howel.*

Of meridian altitude it hath but twenty-three de-
grees, so that it plays but *obliquely* upon us, and as
the sun doth about the twenty-third of January. *Browne.*

For a rational creature to conform himself to the
will of God in all things carries in it a rational
rectitude or goodness; and to disobey or oppose
his will in any thing imports a moral *obliquity*. *South.*

They haply might admit the truths *obliquely* le-
velled, which bashfulness persuaded not to enquire
far. *Fell.*

His discourse tends *obliquely* to the detracting from
others, or the extolling of himself. *Addison.*

May they not pity us, condemned to bear
The various heaven of an *oblique* sphere;
While by fixed laws, and with a just return,
They feel twelve hours that shade, for twelve that
burn? *Prior.*

Bavaria's stars must be accused, which shone
That fatal day the mighty work was done,
With rays *oblique* upon the Gallic sun. *Id.*
It has a direction *oblique* to that of the former
motion. *Cheyne.*

Criticks form a general character from the obser-
vation of particular errors, taken in their own *oblique*
or imperfect views; which is as unjust as to make a
judgment of the beauty of a man's body from the
shade it casts in such and such a position. *Broomes.*

Declining from the noon of day,
The sun *obliquely* shoots his burning ray. *Pope.*
He composed twice in the morning, and dictated
in the day, sitting *obliquely* in an elbow chair, with
his leg thrown over the arm. *Johnson.*

OBLIQUE CIRCLE, in the stereographic projec-
tion, is any circle that is oblique to the plane of
projection.

OBLIQUE DESCENSION is that point of the
equinoctial which sets with the centre of the sun,
or star, or other point of the heavens, in an oblique
sphere.

OBLIQUE FORCE, or percussion, or power, or
stroke, is that made in a direction oblique to a
body or plane. It is demonstrable that the effect
of such oblique force, &c., upon the body, is, to
an equal perpendicular one, as the sine of the
angle of incidence is to radius.

OBLIQUE LINE, that which, falling on another
line, makes oblique angles with it, viz. one acute,
and the other obtuse.

OBLIQUE PLANES, in dialling, are those which
decline from the zenith, or incline towards the
horizon. See DIAL.

OBLIQUE SAILING, in navigation, is when a
ship sails upon some rhumb between the four
cardinal points, making an oblique angle with

the meridian; in which case she continually
changes both latitude and longitude. See NAVI-
GATION.

OBLITERATE, *v. a.* } Lat. *oblitero*. To
OBLITERATION, *n. s.* } efface that which has
been written; hence to wear out or destroy.

The wickedness of Eli's house was neither purged
by sacrifice, nor *obliterated* by time. *Bp. Hall.*

Wars and desolations *obliterate* many ancient mo-
numents. *Hale.*

Considering the casualties of wars, transmigra-
tions, especially that of the general flood, there
might probably be an *obliteration* of all those monu-
ments of antiquity that ages precedent at some time
have yielded. *Id. Origin of Mankind.*

These simple ideas, the understanding can no
more refuse to have, or alter, or blot them out, than
a mirror can refuse, alter, or *obliterate* the images,
which the objects set before it produce. *Locke.*

Let men consider themselves as ensnared in that
unhappy contract, which has rendered them part
of the devil's possession, and contrive how they may
obliterate that reproach, and disentangle their mort-
gaged souls. *Decay of Piety.*

OBLIVION, *n. s.* } Lat. *oblivio*. Forget-
OBLIVIOUS, *adj.* } fulness; non-remem-
brance; cessation of memory: oblivious, caus-
ing oblivion.

Water drops have worn the stones of Troy,
And blind *oblivion* swallowed cities up,
And mighty states characterless are grated
To dusty nothing. *Shakespeare. Troilus and Cressida.*

Thou shouldst have heard many things of worthy
memory, which now shall die in *oblivion*, and thou
return unexperienced to thy grave. *Shakespeare.*

Raze out the written troubles of the brain,
And with some sweet *oblivious* antidote
Cleanse the foul bosom. *Id. Macbeth.*

By the act of *oblivion*, all offences against the
crown, and all particular trespasses between subject
and subject, were pardoned, remitted, and utterly
extinguished. *Davies.*

Knowledge is made by *oblivion*, and, to purchase a
clear and warrantable body of truth, we must forget
and part with much we know. *Browne.*

Among our crimes *oblivion* may be set;
But 'tis our king's perfection to forget. *Dryden.*
Can they imagine that God has therefore forgot
their sins, because they are not willing to remember.
them? Or will they measure his pardon by their
own *oblivion*. *South.*

The British souls
Exult to see the crowding ghosts descend
Unnumbered; well avenged, they quit the cares
Of mortal life, and drink the *oblivious* lake. *Philips.*

Oh, born to see what none can see awake!
Behold the wonders of the *oblivious* lake. *Pope.*
How many good and generous actions have been
sunk into *oblivion* by a distrustful look, or stamp
with the imputation of proceeding from bad motives
by a mysterious and seasonable whisper! *Stearns.*

OBLONG, *adj.* } French *oblong*; Lat. *ob-*
OBLONGLY, *adv.* } *longus*. Longer than broad;
in an oblong form.

The best figure of a garden I esteem an *oblong*
upon a descent. *Temple's Miscellanies.*

Every particle, supposing them globular or not
very *oblong*, would be above nine million times their
own length from any other particle. *Bentley.*

Thus a rectangled parallelogram, whose sides are
unequal, is *oblong*; so also an ellipsis is *oblong*, *c.*
G 2

which shape Cassini originally opined the earth to be. *Sharpe.*

The surface of the temperate climate is larger than it would have been, had the globe of our earth, or of the planets, been either spherical, or oblongly spheroidal. *Cheyne.*

AN OBLONG SPHEROID is that which is formed by an ellipse revolved about its longer or transverse axis, in contradistinction from the oblate spheroid, or that which is flattened at its pole.

OBLOQUY, *n. s.* Lat. *obloquor*. Censorious language; slander; reproach.

Reasonable moderation had freed us from being deservedly subject unto that bitter kind of *obloquy*, whereby as the church of Rome doth, under the colour of love towards those things which be harmless, maintain extremely most hurtful corruptions; so we peradventure might be upbraided, that, under colour of hatred towards those things that are corrupt, we are on the other side as extreme even against most harmless ordinances. *Hooker.*

My chastity's the jewel of our house,
Bequeathed down from many ancestors;
Which were the greatest *obloquy* i' th' world
In me to lose. *Shakespeare.*

Here now aspersions, with new *obloquies*,
Are laid on old deserts. *Daniel's Civil War.*

Canst thou with impious *obloquy* condemn
The just decree of God, pronounced and sworn? *Milton.*

Shall names, that made your city the glory of the earth, be mentioned with *obloquy* and detraction? *Addison.*

Every age might perhaps produce one or two true geniuses if they were not sunk under the censure and *obloquy* of plodding, servile, imitating pedants. *Swift.*

OBMUTES'CENCE, *n. s.* Lat. *obmutesco*. Loss of speech.

A vehement fear often produceth *obmutescence*. *Broune.*

OBNOXIOUS, *adj.* } Lat. *obnoxius*. Lia-
OBNOXIOUSNESS, *n. s.* } ble; exposed; particularly applied to exposure to punishment or disadvantage: hence reprehensible; not of good fame.

I propound a character of justice in a middle form, between the speculative discourses of philosophers, and the writings of lawyers, which are tied and *obnoxious* to their particular laws. *Bacon.*

But what will not ambition and revenge

Descend to? who aspires, must down as low

As high he soared; *obnoxious* first or last,

To basest things. *Milton's Paradise Lost.*

Conceiving it most reasonable to search for primitive truth in the primitive writers, and not to suffer his understanding to be prepossessed by the contrived and interested schemes of modern, and withal *obnoxious* authors. *Fell.*

All are *obnoxious*, and this faulty land,

Like fainting Heister, does before you stand,

Watching your sceptre. *Waller.*

We know ourselves *obnoxious* to God's severe justice, and that he is a God of mercy, and hateth sin; and, that we might not have the least suspicion of his unwillingness to forgive, he hath sent his only begotten son into the world, by his dismal sufferings and cursed death, to expiate our offences. *Calamy.*

Thy name, O Varus, if the kinder powers
Preserve our plains, and shield the Mantuan towers,
Obnoxious by Cremona's neighbouring crime,
The wings of swans, and stronger pinioned rhyme
Shall raise aloft. *Dryden.*

Beasts lie down,

To dews *obnoxious* on the grassy floor. *Id.*

They leave the government a trunk naked, defenceless, and *obnoxious* to every storm. *Davenant.*

OBNU'BILATE, *v. a.* Lat. *obnubilo*. To cloud; to obscure.

OBOLARIA, in botany, a genus of the angiospermia order and didynamia class of plants; natural order fortieth, personate: CAL. bifid: COR. campanulated and quadrid: CAPS. unilocular, bivalved, and polyspermous; the stamina rising from the divisions of the corolla. Species one only, a native of Virginia, bearing clusters of beautiful pale red flowers.

OB'OLE, *n. s.* Lat. *obolus*. In pharmacy, twelve grains.

OBOLUS, an ancient silver money of Athens, the sixth part of a drachma; worth somewhat more than a penny farthing sterling. The word is derived from the Greek *οβολος* or *οβελος*, a spit or broach; either because it bore such an impression, or because, according to Eustathius, it was in form thereof. But those now in the cabinets of antiquaries are round.

OBOLUS, in medicine, is used for a weight of ten grains, or half a scruple.

OBRECHT (Ulric), a learned German, born of a noble family in Strasburg in 1646, where he filled the chairs of civil law and history with great distinction. He was a Protestant; but when Louis XIV. made himself master of Strasburg, and went thither with his court, he changed, and abjured in 1684. In 1685 the king nominated him to preside in his name in the senate of Strasburg, with the title of prætor royal, in imitation of the ancient Romans; from which time he applied himself entirely to public affairs. He was the editor, translator, and writer of several learned works, and died in 1701. His principal pieces are, *Prodromus rerum Alsatiarum*, 4to.; *Excerpta Historica de naturâ Successionis in Monarchia Hispan.* 3 vols. 4to.; *Quintilian with notes*; and *Dictys Cretensis*.

OBREPTION, *n. s.* Lat. *obreptio*. The act of creeping in with secrecy or by surprise.

OBROGATE, *v. a.* Lat. *obrogo*. To proclaim a contrary law for the dissolution of the former.—We insert the four last words after Dr. Johnson; but find no other authority for them.

OBSCENE, *adj.* } Fr. *obscene*; Lat. *ob-*

OBSCENE'LY, *adv.* } *scenus*. Lewd; im-

OBSCENE'NESS, *n. s.* } dest; not agreeable to

OBSCEN'ITY. } chastity or delicacy: the

derivatives corresponding.

Chemos the *obscene* dread of Moab's sons.

Milton.

Care shuns thy walks, as at the cheerful light,
The groaning ghosts, and birds *obscene* take flight..

Dryden.

A girdle foul with grease binds his *obscene* attire.

Id.

Home as they went, the sad discourse renewed, }
Of the relentless dame to death pursued, }
And of the sight *obscene* so lately viewed. *Id.* }

Words that were once chaste, by frequent use
grow *obscene* and uncleanly. *Watts's Logic.*

No pardon vile *obscenity* should find,
Though wit and art conspire to move your mind.

Pope.

It is the sun's fate, like your's, to be displeasing to
owls and *obscure* animals, who cannot bear his lustre.
Id. Letters.

OBSCURE', *adj. & v. a.* Fr. *obscur*; Lat. *obscura*'TION, *n. s.* } *obscurus*. Dark ;
OBSCURELY, *adv.* } gloomy ; partially
OBSCURENESS, *n. s.* } enlightened ; un-
OBSCURITY. } enlightened ; hence
abstruse ; unintelligible ; living in the dark :
to *obscure* is to darken ; make less visible ; less
glorious, beautiful, striking, or intelligible ; to
conceal : the adverb and nouns follow these
senses.

Lo ! a day of darkness and *obscurity*, tribulation
and anguish upon the earth. *Ether xi. 8.*

Whoso curseth his father or mother, his lamp shall
be put out in *obscur* darkness. *Proverbs.*

They are all couched in a pit hard by Herne's oak,
with *obscured* lights ; which, at the very instant
of Falstaff's and our meeting, they will at once dis-
play to the night. *Shakespeare.*

The *obscure* bird clamoured the live-long night.
Id.

What, must I hold a candle to my shames ?
They in themselves, good sooth, are too, too light.
Why, 'tis an office of discovery, love,
And I should be *obscured*. *Id.*

Should Cynthia quit thee, Venus, and each star,
It would not form one thought dark as mine are :
I could lend them *obscureness* now, and say,
Out of myself there should be no more day. *Donne.*

O might I here

In solitude live savage, in some glade
Obscured, where highest woods, impenetrable
To sun or starlight, spread their umbrage broad.
Milton.

The woman's seed at first *obscurely* told,
Now amplier known, thy Saviour and thy Lord.
Id.

Who shall tempt with wandering feet
The dark unbottomed infinite abyss,
And through the palpable *obscure* find out
His uncouth way ? *Id. Paradise Lost.*

Thinking by this retirement to *obscure* himself
from God, he infringing the omniscience and essen-
tial ubiquity of his Maker. *Browne's Vulgar Errors.*

Not to mention that *obscureness* that attends pro-
phetic raptures, there are divers things knowable by
the bare light of nature, which yet are so uneasy to
be satisfactorily understood by our imperfect intel-
lects, that, let them be delivered in the clearest ex-
pressions, the notions themselves will yet appear
obscure. *Boyle on Colours.*

There is scarce any duty which has been so
obscured by the writings of learned men as this.
Wake.

By private consent it hath been used in dangerous
times to *obscure* writing, and make it hard to be read
by others not acquainted with the intrigue. *Bolder.*

Think'st thou, vain spirit, thy glories are the
same,
And seest not sin *obscures* thy godlike frame ?
I know thee now by thy ungrateful pride,
That shows me what thy faded looks did hide.
Dryden.

You are not for *obscurity* designed,
But, like the sun, must cheer all human kind.
Id.

Such was the rise of this prodigious fire,
Which in mean buildings first *obscurely* bred,
From thence did soon to open streets aspire. *Id.*

As to the sun and moon, their *obscuration* or change
of colour happens commonly before the eruption of a
terry mountain. *Burnet.*

What lies beyond our positive idea towards infinity,
lies in *obscurity*, and has the undeterminate confu-
sion of a negative idea, wherein I know I do not
comprehend all I would, it being too large for a finite
capacity. *Locke.*

There live retired
Content thyself to be *obscurely* good.
Addison.

He says, that he is an *obscure* person ; one, I sup-
pose, that is in the dark. *Atterbury.*

Sudden the thunder blackens all the skies,
And the winds whistle, and the surges roll
Mountains on mountains, and *obscure* the pole.
Pope.

In poverty's low barren vale,
Thick mists, *obscure*, involved me round ;
Though oft I turned the wistful eye,
No ray of fame was to be found. *Burns.*
Shall gentle C——e pass unnoticed here,
To turgid ode and tumid stanza dear,
Though themes of innocence amuse him best
Yet still *obscurity's* a welcome guest. *Byron.*

What is writ, is writ
Would it were worthier ! but I am not now
That which I have been, and my visions flit
Obscurely now before me, and the glow
Which in my spirit dwelt is fluttering faint and low.
Id.

OBSECRATION, *n. s.* Lat. *obsecratio*, *ob-*
secro. Intreaty ; supplication.

OBSEQUIES, *n. s.* Fr. *obsequies*, *obsequium*.
Funeral rites or solemnities.

There was Doriaus valiantly requiting his friends
help, in a great battle deprived of life, his *obsequies*
being not more solemnized by the tears of his parta-
kers, than the blood of his enemies. *Sidney.*

Fair Juliet, that with angels doth remain,
Accept this latest favour at my hand ;
That living honoured thee, and being dead,
With funeral *obsequies* adorn thy tomb.
Shakespeare.

Or tune a song of victory to me,
Or to thyself, sing thine own *obsequy*.
Cromwell.

Him I'll solemnly attend,
With silent *obsequy* and funeral train,
Home to his father's house.
Milton's Agonistes.

I spare the widow's tears, their woeful cries,
And howling at their husband's *obsequies* ;
How Theseus at these funerals did assist,
And with what gifts the mourning dames dismiss.
Dryden.

His body shall be royally interred,
I will, myself,
Be the chief mourner at his *obsequies*. *Id.*
Alas ! poor Poll, my Indian talker dies,
Go, birds, and celebrate his *obsequies*. *Creech.*

OBSEQUENS (Julius), a Latin writer, sup-
posed to have lived before Honorius's reign. He
made a collection of the prodigies which Livy
related in his history. There are several editions
of those remains. Lycosthenes endeavoured to
supply what was wanting in the original.

OBSEQUIOUS, *adj.* } Latin *obsequium*.
OBSEQUIOUSLY, *adv.* } Compliant ; obedient ;
OBSEQUIOUSNESS, *n. s.* } unresisting ; servile :
Shakespeare uses it for funeral : the adverb and
substantive follow the foregoing senses.

Your father lost a father ;
That father his ; and the survivor bound
In filial obligation, for some term,
To do *obsequious* sorrow. *Shakespeare. Hamlet.*

I a while *obsequiously* lament
The untimely fall of virtuous Lancaster.

Shakespeare.

Adore not so the rising son, that you forget the
father, who raised you to this height; nor be you so
obsequious to the father, that you give just cause to
the son to suspect that you neglect him. *Bacon.*

I am ashamed to see these thy creatures so *obse-*
quiously pliant unto me while I consider my dispo-
sition and deportment towards thee my Creator.

Bp. Hall.

At his command the up-rooted hills retired
Each to his place; they heard his voice, and went
Obsequious.

Milton's Paradise Lost.

I followed her; she what was honour knew,
And, with *obsequious* majesty, approved
My pleaded reason. *Id.*

See how the *obsequious* wind and liquid air
The Theban swan does upward bear. *Cowley.*

A genial cherishing heat acts so upon the fit and
obsequious matter, as to organize and fashion it ac-
cording to the exigencies of its own nature. *Boyle.*

They rise, and with respectful awe,
At the word given, *obsequiously* withdraw.

Dryden.

We cannot reasonably expect that any one
should readily and *obsequiously* quit his own opi-
nion, and embrace ours with a blind resignation.

Locke.

They apply themselves both to his interest and
humour, with all the arts of flattery and *obsequious-*
ness, the surest and the readiest way to advance a
man. *South.*

His servants weeping,
Obsequious to his orders, bear him hither.

Addison.

The vote of an assembly, which we cannot recon-
cile to public good, has been conceived in a private
brain, afterwards supported by an *obsequious* party.

Swift.

Obsequious, artful, voluble, and gay,
On Britain's fond credulity they play,
All sciences a fasting Monaster know,
And bid him go to hell, to hell he goes.

Johnson.

OBSERVE', *v. a. & v. n.*

OBSER'VABLE, *adj.*

OBSER'VABLY, *adv.*

OBSER'VANCE, *n. s.*

OBSER'VANT, *adj.*

OBSERVA'TION, *n. s.*

OBSERVA'TOR,

OBSER'VATORY,

OBSER'VER,

OBSER'VING, *part. adj.*

OBSER'VINGLY, *adv.*

Fr. observer;

Lat. observo. To

regard with at-

tention; watch;

note; inspect;

keep or practise

strictly or reli-

giously; to be at-

tentive; make a

remark: observ-

able is worthy

or proper to be remarked; remarkable; eminent:
observance, notice; attention; respectful
or ceremonial practice; rule of practice; punc-
tilious or reverential regard: observant is a cor-
respondent adjective: observation, the act or
habit of observing; remark or note made; obe-
dience: observator and observer, one who ob-
serves or peculiarly remarks: observatory, a
place for astronomical or scientific observations:
observing is synonymous with observant.

A night to be much *observed* unto the Lord, for
bringing them out of Egypt. *Erodus xxii. 42.*

Many nations are superstitious, and diligent ob-
servers of old customs, which they receive by tra-
dition from their parents, by recording of their bards
and chronicles. *Spenser.*

Use all the *observance* of civility,
Like one well studied in a sad ostent
To please his grandam. *Shakespeare.*

These kind of knaves in this plainness,
Harbour more craft, and more corrupter ends,
Than twenty silky ducking *observants*
That stretch their duties nicely. *Id.*

Angelo,

There is a kind of character in thy life
That to the *observer* doth thy history

Fully unfold. *Id. Measure for Measure.*

There is some soul of goodness in things evil,
Would men *observingly* distil it out. *Shakespeare.*

These writers, which gave themselves to follow and
imitate others, were *observant* spectators of those
masters they admired. *Raleigh.*

The king after the victory, as one that had been
bred under a devout mother, and was in his nature a
great *observer* of religious forms, caused Te Deum to
be solemnly sung in the presence of the whole army
upon the place. *Bacon.*

Having had such experience of his fidelity and ob-
servance abroad, he found himself engaged in honour
to support him. *Wotton.*

If a slow-paced star had stolen away,

From the *observer's* marking, he might stay
Three hundred years to see't again. *Donne.*

We are told how *observant* Alexander was of his
master Aristotle. *Digby on the Soul, Dedication.*

Remember, that as thine eye *observes* others, so art
thou *observed* by angels and by men. *Taylor.*

There can be no observation or experience of
greater certainty, as to the increase of mankind, than
the strict and vigilant *observance* of the calculations
and registers of the bills of births and deaths.

Hale's Origin of Mankind.

The *observer* of the bills of mortality, hath given
us the best account of the number that late plagues
have swept away. *Hale.*

These proprieties affixed unto bodies from consid-
erations deduced from east, west, or those *observable*
points of the sphere, will not be justified from such
foundations. *Brownne.*

It is impossible to have thunder in a clear sky as
it is *observably* recorded in some histories. *Id.*

Love rigid honesty

And strict *observance* of impartial laws

Roscommon.

Arcite left his bed, resolved to pay
Observance to the month of merry May.

Dryden.

She may be handsome, yet be chaste, you say,—
Good *observer*, not so fast away. *Id.*

If our idea of infinity be got from the power we
observe in ourselves, of repeating without end our
own ideas, it may be demanded why we do not at-
tribute infinity to other ideas, as well as those of
space and duration. *Locke.*

Company, he thinks, lessens the shame of vice
by sharing it; and therefore, if he cannot wholly
avoid the eye of the *observer*, he hopes to distract it
at least by a multiplicity of objects. *South.*

He was so strict an *observer* of his word that no
consideration whatever could make him break it.

Prior.

I took a just account of every *observable* circum-
stance of the earth, stone, metal, or other matter,
from the surface quite down to the bottom of the pit,
and entered it carefully into a journal.

Woodward's Natural History.

Another was found near the *observatory* in Green-
wich Park. *Id. On Fossils.*

The great and more *observable* occasions of exer-
cising our courage occur but seldom. *Rogers.*

Some represent to themselves the whole of religion as consisting in a few easy *observances*, and never lay the least restraint on the business or diversions of this life. *Rogers.*

The rules of our practice are taken from the conduct of such persons as fall within our *observation*. *Id.*

Sometimes purulent matter may be discharged from the glands in the upper part of the wind-pipe, while the lungs are sound and uninfected, which now and then has imposed on undistinguishing *observers*. *Blackmore.*

Himself often read useful discourses to his servants on the Lord's day, of which he was always a very strict and solemn *observer*. *Atterbury.*

Wandering from clime to clime *observant* strayed, Their manners noted, and their states surveyed. *Pope.*

Wherever I have found her notes to be wholly another's, which is the case of some hundreds, I have barely quoted the true proprietor, without *observing* upon it. *Pope's Letters.*

Careful *observers* may foretell the hour,

By sure prognostics when to dread a shower. *Swift.*

In matters of human prudence, we shall find the greatest advantage by making wise *observations* on our conduct, and of the events attending it. *Watts's Logick.*

Observing men may form many judgments by the rules of similitude and proportion, where causes and effects are not entirely the same. *Watts.*

He alone is an acute *observer*, who can *observe* minutely without being *observed*. *Sterns.*

Let *observation* with extensive view

Survey mankind from China to Peru ;

Remark each anxious toil, each eager strife,

And watch the busy scenes of crowded life. *Johnson.*

Such dupes are men to custom, and so prone

To reverence what is ancient, and can plead

A course of long *observance* for its use,

That even servitude, the worst of ills,

Because delivered down from sire to son,

Is kept and guarded as a sacred thing. *Cowper.*

OBSERVATORY. An observatory is a term applied emphatically to buildings erected and furnished with instruments for astronomical observations. Formerly it assumed the shape of a tower or turret erected on some eminence ; but in modern erections of this kind convenience and scope in regard to aspect, and solidity of structure, have been more particularly regarded.

Astronomers carry us back not only to the pyramids of Egypt, but even to the tower of Babel as originally designed for some purpose of this kind. It would appear probable that the temple of Belus was devoted to this use by the Chaldean astronomers ; as was the famous tomb of Osmandias, in Egypt. See our article **ASTRONOMY**. At Alexandria an observatory was built more than 300 years before the Christian era, and continued in repute for upwards of five centuries.

ORIENTAL OBSERVATORIES. The oriental vestiges of ancient observatories are well collected in Bailly's *Histoire de l'Astronomie Indienne*, and in the *Asiatic Researches*, by Sir William Jones, Mr. Colebrooke, &c. The Hindoo ob-

servatories of more modern times are said to have been five in number, viz. at Delhi, Benares, Matra, Oujein, and Suvai Jeypour, and were erected by order of Mahommed Shah, with a view to reforming the calendar. The task of constructing them was committed to Jeysing, or Jeyasinha, rajah of Ambhere, learned in the mysteries of science.

'Seeing that very important affairs,' says Jeysing, 'both regarding religion and the administration of empire, depend upon these ; and that in the time of the rising and setting of the planets, and the seasons of eclipses of the sun and moon, many considerable disagreements of a similar nature were found ; I (Jeysing) represented it to his majesty of dignity and power, the sun of the firmament of felicity and dominion, the splendor of the forehead of imperial magnificence, the unrivalled pearl of the sea of sovereignty, the incomparably brightest star of the heaven of empire,' &c. &c. His majesty was pleased to reply, 'Since you, who are learned in the mysteries of science, have a perfect knowledge of this matter ; having assembled the astronomers and geometricians of the faith of Islam and the Brahmins and Pundits, and the astronomers of Europe, and having prepared all the apparatus of an observatory, do you so labor for the ascertaining of the point in question, that the disagreement between the calculated times of those phenomena and the times in which they are observed to happen may be rectified.' See a curious paper containing this astronomer's own account of his proceedings in the *Asiatic Researches*, vol. v. p. 177. Of the Benares observatory we have in the *Philosophical Transactions* vol. lxvii. the following account from Sir Robert Barker ; who says that it was said in his time to have been built by the emperor Acber. Mr. Hunter's would seem, however, to be the best authenticated account.

'We entered this building,' says Sir Robert Barker, 'and went up a stair-case to the top of a part of it, near the river Ganges, that led to a large terrace, where, to my surprise and satisfaction, I saw a number of instruments yet remaining, in the best preservation, stupendously large, immovable from the spot, and built of stone, some of them being upwards of twenty feet in height ; and, though they are said to have been erected 200 years before, the graduations and divisions on the several arcs appeared as well cut, and as accurately divided, as if they had been the performance of a modern artist. The execution in the construction of these instruments exhibited a mathematical exactness in the fixing, bearing, and fitting of the several parts, in the necessary and sufficient supports to the very large stones that compose them, and in joining and fastening them into each other by means of lead and iron cramps. The situation of the two large quadrants whose radius is nine feet two inches, by being at right angles with a gnomon at 25° elevation, are thrown into such an oblique situation as to render them the most difficult, not only to construct of such a magnitude, but to secure in the position for so long a period, and affords a striking instance of the

ability of the architect in their construction; for, by the shadow of the gnomon thrown on the quadrants, they do not appear to have altered in the least from their original position; and so true is the line of the gnomon that by applying the eye to a small iron ring, of an inch diameter, at one end, the sight is carried through three others of the same dimension to the extremity at the other end, distant thirty-eight feet eight inches, without obstruction, such is the firmness and art with which this instrument has been executed. This performance is the more extraordinary when compared with the works of the artificers of Hindostan at this day, who are not under the immediate direction of a European mechanic; but arts appear to have declined equally with science in the east.

Lieut. col. Arch. Campbell, at that time (1777) chief engineer in the East India company's service at Bengal, a gentleman whose abilities do honor to his profession, made a perspective drawing of the whole apparatus that could be brought within his eye at one view; but I lament he could not represent some very large quadrants, whose radii were about twenty feet, being on the side whence he took his drawing. Their description, however, is, that they are exact quarters of circles of different radii, the largest of which I judged to be twenty feet, constructed very exactly on the sides of stone walls built perpendicular, and situated, I suppose, in the meridian of the place: a brass pin is fixed at the centre or angle of the quadrant, from which the brahmin informed me they stretched a wire to the circumference when an observation was to be made; from which it occurred to me the observer must have moved his eye up or down the circumference, by means of a ladder or some such contrivance, to raise or lower himself, till he had discovered the altitude of any of the heavenly bodies in their passage over the meridian, so expressed on the arcs of these quadrants; these arcs were very exactly divided into nine large sections; each of these again into ten, making ninety less divisions or degrees; and those also into twenty, expressing three minutes each, of about two-tenths of an inch asunder; so that it is probable, they had some method of dividing even these into more minute divisions, at the time of observation.

'My time would only permit me to take down the particular dimensions of the most capital instrument, or the greater equinoctial sun-dial, which appears to be an instrument to express solar time by the shadow of a gnomon on two quadrants, one situated to the east and the other to the west of it; and indeed the chief part of their instruments at this place appear to be constructed for the same purpose, except the quadrants, and a brass instrument described hereafter. There is another instrument for the purpose of determining the exact hour of the day by the shadow of a gnomon, which stands perpendicular to, and in the centre of, a flat circular stone, supported in an oblique situation by means of four upright stones and a cross piece; so that the shadow of the gnomon, which is a perpendicular iron rod, is thrown on the divisions of

the circle described on the face of the flat circular stone. There is also a brass circle, about two feet diameter, moving vertically on two pivots between two stone pillars, having an index or hand turning round horizontally on the centre of this circle. This instrument appears to be made for taking the angle of a star at setting or rising, or for taking the azimuth or amplitude of the sun at rising or setting. The use of another instrument I was at a loss to guess. It consists of two circular walls; the outer of which is about forty feet in diameter, and eight feet high; the wall within about half that height, and appears intended for a place to stand in to observe the divisions on the upper circle of the outer wall, rather than for any other purpose; and yet both circles are divided into 360°, each degree being subdivided into twenty small divisions, the same as the quadrants. There is a door-way to pass into the inner circle, and a pillar in the centre, of the same height with the lower circle, having a hole in it, being the centre of both circles, and seems to be a socket for an iron rod to be placed perpendicularly in it. The divisions on these, as well as all the other instruments, will bear a nice examination with a pair of compasses. There is also a smaller equinoctial sun-dial, constructed on the same principle as the large one. This observatory at Benares is said to have been built by the order of the emperor Ackbar; for, as this wise prince endeavoured to improve the arts, so he wished also to recover the sciences of Hindostan, and, therefore, directed that three such places should be erected; one at Delhi, another at Agra, and the third at Benares. Some doubts have arisen with regard to the certainty of the ancient brahmins having a knowledge in astronomy, and whether the Persians might not have introduced it into Hindostan when conquered by that people; but these doubts, I think, must vanish, when we know that the present brahmins pronounce, from the records and tables which have been handed to them by their forefathers, the approach of the eclipses of the sun and moon, and regularly as they advance give timely information to the emperor and the princes in whose dominions they reside.'—*Philosophical Transactions*, vol. lxvii. p. 598, or *Abridgment*, vol. xiv. p. 214.

Mr. Hunter's paper speaks distinctly of the same astronomer having 'bound the girdle of resolution to his soul, and constructed at Delhi several of the instruments of an observatory, such as had been formerly erected at Samarcand, agreeably to the Mussulman books.' 'Thus an accurate method,' it continues, 'of constructing an observatory was established; and the difference which had existed between the computed and observed places of the fixed stars and planets, by means of observing their mean motions and aberrations with such instruments was removed. And, in order to confirm the truth of these observations, he constructed instruments of the same kind in Suwai Jeypour, and Matra, and Benares, and Oujein.'

Father le Comte describes a very magnificent observatory, erected at Peking so far back as the thirteenth century, and furnished by the late

emperor of China with many new instruments, of which a catalogue may be found in Duhalde's China. This was at the intercession of some Jesuit missionaries, chiefly father Verbiest, whom he appointed his chief observer. The instruments are exceedingly large; but the divisions are less accurate, and, in some respects, the contrivance is less commodious than in those made in Europe at this period. The chief are, an armillary zodiacal sphere, of six Paris feet diameter; an azimuthal horizon, six feet diameter; a large quadrant six feet radius; a sextant eight feet radius; and a celestial globe, six feet diameter.

EUROPEAN OBSERVATORIES.—Copernicus is stated to have been the first European who set an instrument in the meridian: this was in the year 1540. Twenty years after William I. of Hesse furnished his observatory at *Cassel*, under the direction of Tycho Brahe and Bailly, regarded then as the first regular erection of the kind in Europe.

Tycho Brahe's own observatory, or that of Uranibourg, on the Huen Island in the Sound, was the next in order. He projected this erection for the purpose of making a new catalogue of the fixed stars; a determination to which he was induced by the appearance of a new and very bright star in Cassiopeia, which filled all Europe with astonishment and consternation. The first stone was laid in August 1576, under the immediate patronage of Frederick II. of Denmark; and it contained a noble set of instruments until the beginning of the last century. Among them was a celestial globe six feet in diameter. The whole town, however, has long since been a heap of ruins: this globe was burnt in the general conflagration of Copenhagen in 1728. His celebrated sextant has been transferred as a constellation to the heavens, and is marked sextans or sextans Uranie, under the breast of Leo.

The other European observatories we shall describe in alphabetical order, with the exception of those of our own country, which will close the article.

Avignon. Here an observatory was built by father Bonfa, so early as 1683, and it has been occupied by a succession of learned ecclesiastics, who have frequently contributed to the enlargement of astronomical science.

At *Berlin* Frederick I. of Prussia founded an observatory in 1711, under the direction of Leibnitz, president of the Royal Academy of Sciences. It is a large square tower. Here Grischow, Kies, and La Lande, made various observations. The last astronomer says that, about the year 1752, he raised enormous pillars here, to which he attached the mural quadrants, north and south. (*Memoires de l'Academie*, 1751 and 1752.) Frederick II. added a fine building, where the Academy of Sciences holds its assemblies. The late astronomer royal, M. Bode, distinguished himself as the publisher of one of the most complete celestial atlases extant, entitled *Uranographia*, which is accompanied with a well arranged catalogue and history of the stars observed here.

At *Béziers* (France) the bishop's tower was

converted to an observatory, where observations have been made by Bouillet on Saturn's ring.

Bologna observatory was erected in the palace of the Institute in 1714, by count Marsigli; pope Benedict XIV. giving the instruments. Here, it may be remembered, is the celebrated meridian line of Cassini. See *Bologna*.

At *Bourdeaux* is an observatory seventy-five feet high, and twenty feet square, situated exactly in latitude 45° , or the middle of our temperate zone. Here Turgot procured a complete set of observations to be made on the length of a pendulum vibrating seconds.

Brest has an observatory on a small scale for the naval academy; and plans have been formed for a larger edifice.

At *Bremen*, in Dr. Oller's observatory, were discovered the new planets Pallas and Vesta.

Brunswick has an observatory where the determination of the orbits of the new planets, and other valuable observations, have been made by Dr. Gauss.

Cadiz has an observatory attached to the marine academy, and furnished both with English and French instruments. The observations made here by Varilla have been published in two vols.

Carthage has also an observatory.

At *Copenhagen* an astronomical tower was built by Christian IV. in 1656, at the suggestion of Longomontanus. Mr. Bugge, formerly the astronomer here, mentions various observatories in Greenland, Iceland, and Norway, as having been at various times erected by the Danish monarchs.

At *Dantzic* a former observatory was used by Hevelius, who has described it in his *Machena Celestis*. The modern one was built in 1778.

At *Dijon* M. Necker converted the tower of the king's lodge into an observatory, where the able Bernard made numerous published observations.

Dorpat in Livonia has an observatory, under the able direction of M. Struve, which has been supplied, in the most handsome manner, with fine instruments by the emperor of Russia. M. Fraunhofer of Munich has been occupied for two years in completing, for this observatory, an achromatic telescope, fourteen feet in focal length, and with an aperture of nine inches. 'You may judge from this,' says M. Struve, in a letter to baron de Zach, 'how much our liberal government does for astronomy. Our observatory is particularly indebted to the curator of our university, M. General Comte de Lievan, who has not only provided it with every thing that is excellent and perfect in the way of instruments, but has also built a commodious house for the astronomer. He has likewise ordered a great meridian circle, similar to that of Göttingen, Munich, and Königsberg: a great repeating circle; and a universal instrument, &c., all from the manufactory of M.M. Reichenbach and Ertel of Munich.'—*Zach's Corres. Astro.* vol. viii. p. 370.

Florence has an observatory, erected by the magnificent cardinal Ximenes, which contains a quadrant by Toscanelli, the largest known, and with which he made observations to prove the secular diminution of the obliquity of the ecliptic.

tic. At his death he bequeathed the whole to the Jesuits' college. In 1772 the grand duke Leopold built an observatory, which M. Fontana superintended, and in 1786 it was furnished with several fine instruments of Ramsden's.

Göttingen observatory has long been celebrated by the labors of Mayer: it has lately been refitted with instruments under the direction of M. Gauss. See our article GÖTTINGEN. Here in 1804 the planet Juno was discovered.

Leipsic had an old tower of great firmness converted into an observatory in 1788.

At *Lilienthal*, near Bremen, is a well-furnished observatory, which was long under the direction of M. Schroeter, who has made many valuable observations on the phases of the moon and planets.

Lisbon observatory was erected by John V. in 1728, at the royal palace. In 1726 some good observations were made at another observatory here belonging to the Jesuits. Vide Philos. Trans. xxxv. A second royal observatory was constructed at the Chateau de St. George, Lisbon, in 1787, by Custodio Gomez.

At *Lyons* the college observatory was built on an eminence by Father St. Benet, and is a fine edifice.

At *Malta* was formerly the most southerly observatory in Europe, viz. in 30° lat. It was erected under the auspices of the grand master Eman. de Rohan in 1783, furnished with the best instruments, and placed under the able direction of the Chevalier d'Angos. In 1789 the valuable papers of this observatory were accidentally burnt, and the instruments greatly damaged.

The *Marseilles* observatory is chiefly famous for the observations of M. de Sylvabelle.

At *Milan* is an observatory built by the Jesuits in 1765, chiefly at the expense of father Pallavinci, under the direction of the celebrated Boscovich. The instruments were selected both in England and France, and Cesaris, Oriani, and Reggio, have been distinguished observers here.

At *Montauban* the duc de la Chappelle erected an observatory, where he made many interesting observations, particularly of the transit of Venus over the sun in 1769.

Montpelier has long had an observatory erected on one of the towers of the city. M. Ratte and M. Poitevin have here distinguished themselves.

At *Moscow*, before the conflagration, was an observatory, furnished with instruments by Cary of the Strand: whether it has survived that catastrophe we have not heard.

An observatory was built at *Nuremberg* in the year 1678, and another in 1692. M. Zimmert and M. Wuzzelbau have been able authors and accurate observers, connected with these establishments.

At *Padua* the observatory was originally a tower of the tyrant Egellin's, and contained, in the thirteenth century, the dungeons in which he placed his prisoners in the civil wars of the period. On its being converted into an observatory in the year 1769 Boscovich wrote the following lines:—

Quæ quondam infernas tarris ducebat ad umbras,
Nunc Venetus auspiciis pandit ad astra viam.

This tower to infernal realms once led below,
But now the way to heaven's bright realms doth show.

At *Palermo* an observatory has been constructed in the former palace of the viceroy. Father Piazzi collected the instruments in Paris and England in 1788 and 1789, among which are a fine transit instrument, and a complete circle, by Ramsden. The first labors of this astronomer were directed to the formation of a catalogue of stars, and, as a foundation, he chose Wollaston's catalogue, and, as his chief points of reference, Dr. Maskelyne's thirty-six stars. In the prosecution of this task he discovered, in 1801, the new planet Ceres, so named in honor of Sicily.

The *Paris* royal observatory was begun in 1667, and finished in 1672. It is 160 feet in front length, 120 broad, and ninety feet high, having a terrace at top; and cellars underneath ninety feet deep. There is said to be neither iron nor wood employed in its construction. Here was not long since an old thermometer of M. de la Hire, which stood always at the same height; thereby showing that the temperature of the place remained always the same. The mural quadrant used by La Lande here, has been, in imitation of that of Tycho Brahe, transferred to the heavens as a constellation, situated between Hercules, Bootes, and the Serpent, as the quadrans muralis, containing forty stars. New rooms and vaults have been added to this building since 1788, as well as a large transit instrument and circle by Ramsden, and three observers were established here by the unfortunate Louis XVI. On the first floor of the west tower is a geographical chart, twenty-seven feet in diameter, traced under the direction of Cassini.

'The astronomers of the academy had besides several private observatories erected in different parts of Paris,' says La Lande, 'as the royal observatory was not sufficient for all. That of M. le Monnier has been, from the year 1742, in the garden of the Capuchins. That of the marine, which Joseph de l'Isle used in 1748 at the Hotel de Clugny, where I labored during two years, is at present (1792) occupied by M. Messier. That of la Caille still exists in the Mazarin College. I, as well as M. d'Agelet, have made several observations there since his death. That of the palace of Luxembourg is above the port royal. Joseph de Lisle observed there, and I likewise occupied it for some time. That of M. Pingré at the abbey of St. Génévieve was built in 1756. There is one of M. Cagnoli's, Rue de Richlieu, which this able astronomer built at his own expense in 1785, when he still resided at Paris. The observatory of the military school, built for M. Jeaurat in 1768, was occupied afterwards by M. d'Agelet. The late M. Bergeret, receiver-general of finances, constructed in 1774, at my request, a large mural quadrant of eight English feet radius, the last and the best instrument made by the celebrated Bird, the loss of whose talents we still regret. This instrument was obtained by the military academy, as well as an excellent transit instrument, and a

parallactic telescope. M. d'Agelet made a great number of observations there from 1778 to 1785, when he left it to make a voyage round the world with la Perouse. In 1788 the changes made in the military school occasioned the demolition of this observatory; but it has been rebuilt, by my desire and care, a little more to the west, with all necessary attention and expense, so that it is the most complete observatory we have at Paris. Having received the direction of it, I began, in 1789, to make the following observations. M. le François la Lande, my relation and pupil, who is a very good astronomer, has also made a prodigious number of observations, and we observed, in 1791, more than 10,000 northern stars with excellent instruments. This work was very much wanted, and I consider it as one of the most important and difficult things that could be undertaken for astronomy.

An observatory was built in 1775 at the royal college for the use of the professor of astronomy of this celebrated school. M. Geoffroy d'Assy built, in 1788, an observatory at his house, Rue de Paradis, and it will become one of the most useful by the zeal and intelligence of M. de Lombre.

The *St. Petersburg* observatory is one of the most magnificent and well-furnished in Europe, and was an erection of the czar Peter I. shortly after his visit to England. It has three stories, and is 130 feet high. M. de l'Isle, according to La Lande, has made a number of excellent observations here.

At *Pisa* is an observatory in the form of a tower. It was erected in 1730, at the expense of the university, and supplied with beautiful apparatus made by Sisson, Short, Graham, &c. Perelli and Slope, who published an excellent collection of observations in 1789, made here for many years.

At *Rome*, cardinal Zelada, at his own expense, constructed, on the southern side of the Roman college, a fine observatory, which contains the large sector of Boscovich, and instruments by Ramsden and Dollond; the abbé Calandrelli observed here with great accuracy for many years. In different parts of Rome are several minor establishments of this kind.

At *Seeburg*, near Gotha, is one of the most complete observatories in the world. It has a large transit and two murals of eight feet radius, by Ramsden, and a circle of eight feet diameter. Baron Zach, appointed in 1788, was the first professor. In 1798 he was visited here by La Lande and all the great astronomers of Germany.

The *Stockholm* observatory was founded by the Academy of Sciences of that city, in 1746. It is situated on a hill north of the town, and has a good collection of English instruments. Wargentin and Nicarder here have been celebrated professors.

At *Strasbourg*, Brackenhofer, professor of mathematics, had an observatory over the city gates, and was succeeded by Herzenschneider.

The observatory of M. Darquier at *Toulouse*, has been distinguished by his zeal and ability. Observatories have also been built in this city by M. Gauprey and M. Bonrapos. The principal one was, in 1813, under the care of Vidal.

At *Turin*, father Beccaria erected an observatory; and in 1790 a larger one was built here by the king of Sardinia, at the Royal College of Nobles, and the care of it given to the abbé Caluso.

At *Venice* is the observatory of father Panigai, and the small one near the town by Miotti.

At *Verona* Cagnoli erected, in 1787, an observatory, furnished with the best instruments, at his own expense. He has made many accurate and important observations here on the precession of the equinoxes, and on the places of 473 northern, and twenty-eight southern stars.

The university observatory of *Vienna* was founded by the empress Maria Theresa, in the year 1755, who furnished it with many superb instruments. There is another now belonging to the academical college, which was built in 1735, and endowed by the Jesuits. It is furnished with very fine instruments by English artists, and has had a succession of very learned observers. The reputation of the university observatory was maintained for many years by the abbé Maximilian Hell, who conducted the *Vienna Ephemeris*.

The observatory at *Upsal*, built and endowed in 1739 by the king of Sweden, was first superintended by the learned Celsius, who has been followed by Hooker and Wargentin, the author of the *Tables of Jupiter's Satellites*.

At *Utrecht* an ancient tower was, in 1726, converted into an observatory. Here the celebrated Van Muschenbroek observed for many years.

At *Wilna*, in Poland, is a splendid establishment of this kind, originally built and well endowed by the countess Puzynia, a lady of considerable astronomical attainments. Being completed in 1753, the king of Poland, by letters patent, gave it the title of a Royal Observatory, and appointed the Jesuit Poezobat astronomer royal. In 1788 a second erection was added under his direction, and several new instruments, by Ramsden.

OBSERVATORIES OF GREAT BRITAIN AND IRELAND. Having supplied every part of Europe with some of the most important and accurate instruments which these erections contain, it was to be expected that within our own island some splendid and useful establishments of the same description should be found. Nor will the scientific enquirer after them be disappointed.

First in importance, perhaps, among the observatories of the world, is that of Greenwich. It was built and endowed in the year 1676, by order of king Charles II., at the instance of Sir Jonas Moore, and Sir Christopher Wren: the former being surveyor-general of the ordnance: a circumstance from which the office of astronomer royal has been placed under that department.

This observatory was at first furnished with various accurate and beautiful instruments; particularly a noble sextant of seven feet radius, with telescopic sights; and the astronomers royal have always been distinguished. The person to whom the province of observing was first committed was Mr. John Flamsteed; a man who, as Dr. Halley expresses it, seemed born for the

employment. During fourteen years he watched the motions of the planets with unwearied diligence, especially those of the moon. In 1690 having provided himself with a mural arch of near seven feet radius, made by his assistant Mr. Abraham Sharp, he began to verify his catalogue of the fixed stars (which had hitherto depended altogether on the distances measured with the sextant) after a new and very different manner, viz. by taking the meridian altitudes, and the moments of culmination, or in other words the right ascension and declination. And he was so well pleased with this instrument that he discontinued almost entirely the use of the sextant. In the space of upwards of forty years this astronomer collected an immense number of observations, which may be consulted in his *Historia Cœlestis Britannica*, published in 1725; the principal part of which is the Britannic catalogue of the fixed stars.

On his death, in 1719, Mr. Flamsteed was succeeded by Dr. Halley, and he by Dr. Bradley in 1742, and this last by Mr. Bliss in 1762.

On the demise of Mr. Bliss, in 1765, the office devolved on Dr. Nevil Maskelyne, whose valuable observations have been published, from time to time, under the direction of the Royal Society. Of these observations La Lande says, in his *Astronomy* (vol. ii. page 121), *Le recueil le plus moderne et le plus précieux de tous est celui de M. Maskelyne, astronome royal d'Angleterre, qui commence à 1765, et qui forme déjà deux volumes en folio jusqu'à 1786. La précision de ces observations est si grande, qu'on trouve souvent la même seconde pour l'ascension droite d'une planète déduite de différentes étoiles, quoiqu'on y emploie la mesure du temps.* His catalogue of fundamental stars is an invaluable treasure. These and his other numerous and various improvements in this science, made during the forty-six years he was astronomer royal, entitle him to the most distinguished rank among both critical and practical astronomers.

Dr. Maskelyne died in the spring of 1811, and was succeeded by Mr. J. Pond, F.R.S., the translator of La Place's *Exposition du Système du Monde*.

The establishment here consists of two principal buildings, one of which is the observatory, and the other the residence of the astronomer royal. The observatory is an oblong edifice, running east and west, containing four rooms, or apartments on the ground-floor. It was erected on the site of the ancient moated tower of duke Humphrey, uncle to Henry VI., and the first stone of it was laid August 10th, 1675, by Mr. Flamsteed. It is situated on the highest eminence of Greenwich Park, about 160 feet above low water mark; the soil being a flinty gravel, through which the rain soon passes, and thus the atmosphere is generally dry which contributes both to the preservation of the instruments, as well as to the uniformity of refraction.

The first, or most easterly apartment has been fitted up for the reception of a very fine transit circle, by Troughton, and a clock of great value by Hardy. The next apartment is the transit room: it has a double sloping roof, with sliding shutters, which are opened both north and south,

with great ease, by pulleys. The transit instrument, which is eight feet long, and the axis three feet, is suspended on two stone pillars. This instrument is famous as having been used by Halley Bradley, and Maskelyne. It was originally made by Bird, and has been improved by Dollond and Troughton. The astronomical or transit clock, which is attached to a stone pillar, was made by Graham, and improved by Earnshaw. The third apartment is the assistant observer's library, and the western apartment of the building is the quadrant room. Here is erected a stone pier, running north and south, to which are attached two mural quadrants, of eight feet radius each. That on the eastern face, which observes the southern meridian, was made by Bird, and the other, which observes the northern, by Graham. Suspended to the western wall is the zenith sector, with which Dr. Bradley made those observations at Kew and Wanstead, which led to the discoveries of the aberration of light, and the nutation of the earth's axis. South of the quadrant room is a wooden building for making occasional observations in any direction, where only the use of a telescope, and an accurate knowledge of the time, are required. It is furnished with sliding shutters on the roof and sides, to view any point of the hemisphere, and contains some excellent telescopes, particularly a forty-inch achromatic, with a triple object-glass, and a five feet achromatic, by Dollond; with a six-feet reflector by Dr. Herschel.

North of the observatory, and east of the house, are two small buildings, covered with hemispherical sliding domes, in each of which is an equatorial sector, by Sisson, and a clock, by Arnold. These are chiefly used for observing comets. Over the dwelling apartments is a large octagonal room, which contains a great variety of astronomical instruments, and a valuable scientific library. On the top is an excellent camera obscura. In Flamsteed's time there was a well sunk in the south-east corner of what is now the garden, for the purpose of seeing the stars in the day-time, and observing the earth's annual parallax. It was 100 feet deep, with stone stairs down to the bottom: but it has been long arched over, as the improvements in the telescope have rendered it useless.

The observations made at the Royal Observatory are not only allowed to possess an unrivalled accuracy, but have been the foundation of the most important work on practical astronomy ever published; we mean the *Nautical Almanack* which Dr. Maskelyne commenced here in 1767. Delambre, in a paper on the life and labors of Dr. Maskelyne, read before the National Institute of France, January 4th, 1813, says—'He (Dr. Maskelyne) has given a catalogue of stars, not numerous, but so accurate, as to have served, almost solely for the last thirty years, as the foundation of all astronomical researches. In short, it may be said of the four volumes of Observations which he has published, that if, by a great revolution, the science should be lost, and this collection only were saved, there would be found in it sufficient materials to construct almost an entire edifice of modern astronomy; which cannot be said of any other collection.'

The *Oxford* observatory claims, perhaps, our next attention; it was founded in 1772 by funds bequeathed by Dr. Radcliff, on a grant of land from the duke of Marlborough. Here are some very excellent telescopes and clocks, by Dr. Herschel, Dollond, and Shelton; and a fine transit instrument ten feet long, which is said to have cost 150 guineas; the zenith sector 200, and the two mural quadrants 600 guineas; it was built under the direction of Dr. Hornsby, professor of astronomy, who observed here for many years. The observations are all registered, and have consisted chiefly of the right ascensions and zenith distances of the sun, moon, planets, and fixed stars.

At *Cambridge* there have long been small observatories at Christchurch, Trinity, St. John's &c.; but the noble plan for erecting one upon a scale worthy the scientific fame of the university has been at last completed. See our article *ASTRONOMY*.

The *Portsmouth* observatory, at the Royal Marine Academy, was first erected and placed under the superintendence of Mr. Bailey, a former assistant astronomer at Greenwich, who accompanied Cook in his latter voyages. It has been particularly useful in regulating the time-keepers of vessels. *Christ's Hospital* and *Somerset House* have also observatories attached on a small scale.

The late Dr. Herschel's observatory at *Slough*; stands, perhaps, at the head of our private establishments of this kind. His larger instruments are in the open air; and the celebrated forty-foot telescope contains a mirror of a ton weight; and this great instrument, with nearly an additional ton of cases, &c., is five feet in diameter, and is managed by a very slight force. The top is suspended by ropes from very lofty ladder-work. Thus, by a system of wheels, pinions, racks, and pulleys, the motions, both horizontal and vertical, are given, and any celestial object is readily and commodiously viewed. It was finished in 1789, and on the first trial a new satellite of Saturn was discovered. The great speculum of this noble instrument is forty-nine inches and a half in diameter; its polished surface forty-eight inches,—its thickness three inches and a half, and its weight, when newly cast, 2118 lbs. The tube was thirty-nine feet four inches long, and four feet ten inches in diameter, and every part of it was made of rolled or sheet iron, united without rivets, by a species of sealing used in making the iron-funnels for stoves. The thickness of the iron was less than the thirty-sixth part of an inch, and a square foot weighed about fourteen ounces. Hence, it was so light, that a wooden one would have exceeded it in weight at least 1000 lbs. It magnifies 6450 times. La Lande speaks with great admiration of this instrument. Other telescopes of various sizes are mounted around; and two smaller ones have discovered six comets. That by which in 1781 the Dr. first saw the Georgium Sidus has been made a constellation in the heavens between Gemini, the Lynx, and Auriga, and contains eighty-one stars. In Bode's Atlas it is engraved with its apparatus, and marked 'Telescopium Herschellii.'

In addition to our memoir of this great astronomer, we may observe, that the subject of the construction of the heavens, which Dr. Herschel had made entirely his own, formed the principal topic of his later communications to the royal Society. In 1814 he published in the Transactions his *Astronomical Observations* relating to the sidereal part of the heavens, and its connexions with the nebulous part. He supposes, in this paper, that the various nebulosities which fill the heavens are condensed by attraction, and converted into stars; that stars previously formed sometimes attract nebulous matter, and increase in size, and that neighbouring stars gradually approach each other, and constitute globular clusters. This paper was followed, in 1817, by *Observations* tending to investigate the local arrangement of the Celestial Bodies in space, and to determine the extent and condition of the Milky Way; which contains much interesting discussion, and in which its author concludes, that not only our sun, but all the stars we can see with the eye, are deeply immersed in the milky way, and form a component part of that immense nebula. The last paper which Dr. Herschel wrote on this subject, and indeed the last which he communicated to the Royal Society, was entitled *Astronomical Observations and Experiments* selected for the purpose of ascertaining the relative distances of Clusters of Stars, and of investigating how far the power of our Telescopes may be expected to reach into Space, when directed to ambiguous celestial Objects. From these observations our author concludes that a star of the first magnitude would just come to be visible by the naked eye, if removed to twelve times its distance, and by the most powerful telescope hitherto constructed, if removed to 2300 times its distance. Yet such a telescope still shows stars in the milky way at the utmost limits of their visibility. This extraordinary assemblage of stars is therefore equally fathomless by our eyes and by our finest telescopes. Conceiving, however, that the united lustre of sidereal systems may reach us from a still greater distance in space, Dr. Herschel estimates their distance by the aperture of the speculum, which just resolves them into stars, and in this way he has estimated the distances of forty-seven clusters. Such clusters are again taken as connecting links with such ambiguous objects as cannot be resolved by the telescope. Resolvable clusters are actually found to put on similar appearances with inferior telescopes, and hence we may compare their distances with those of the former kind, by the same principles as those with the nearest fixed star. When objects of this kind are lost to the sight, the utmost limits of human vision seem to be obtained, and our author supposes that this must take place at about the 35,000th order of distances.

The late king's private observatory, in *Richmond* gardens, is an extremely beautiful structure, but the apparatus was originally very inferior. It was built, in 1768, by order of George III., who, it is said, made several observations here, particularly of the transit of Venus in 1769. It contains a transit instrument, zenith sector, and mural arc, with several good telescopes, especi-

ally a ten-foot reflector of Dr. Herschel's. There is also a superb equatorial on the top of the building, which has a moveable roof.

The *Scottish* observatories are not remarkable. Aberdeen, Edinburgh, and Glasgow, contain small establishments of this kind; and in the Scottish capital we observe (see our article *EDINBURGH*) a new observatory is said to have been finished since 1813. The Glasgow Macfarlane observatory is also honorable to that city.

The Irish observatories are on a more imposing scale. That at *Armagh* was founded, in 1793, by the most Rev. lord Rokeby, the primate of Ireland. On this erection and the museum connected with it he bestowed £15,000. The former stands on a hill about ninety feet above the level of the town, and surrounded by several undulating hills of about the same altitude. The building is founded on a base of limestone, and all the walls are of large hewn stone, of the most firm and substantial workmanship. The tower, which adjoins the dwelling house, contains a very fine equatorial by Troughton, fixed on a large pillar, which is raised so high that the instrument in the dome can overlook all the buildings. To the east of the house is a range of buildings for the transit room, and other astronomical purposes. The principal instruments, besides the equatorial and transit, are a ten-foot sextant by Troughton; a ten-foot reflecting telescope by Dr. Herschel; a five-foot triple object glass achromatic telescope by Dollond; and also a fine night glass upon an equatorial stand. The clocks are by Earnshaw of London, and Crossthwaite of Dublin. Liberal incomes are allowed to the principal astronomer and his assistant. The former the Rev. James Archibald Hamilton, D. D. dean of St. Coleman, Cloyne, has contributed several learned papers to the Transactions of the Royal Irish Academy, on astronomical subjects. His observations of the fixed stars are considered very accurate, and several of his declinations have been transcribed into the London Philosophical Transactions. The registered observations here are those made with the transit instrument and equatorial; and an account of the temperature and weight of the atmosphere. Of these, a series of about eighteen years is preserved. The right ascensions of the sun and moon, compared with the fixed stars, are regular and unbroken; but their north polar distances have not been so constantly taken. There belong to this establishment about twenty acres of plantation and pleasure grounds, which are open for the recreation of the inhabitants of the city.

The observatory of Trinity College, *Dublin*, was begun in the year 1783; and founded and endowed by Dr. Andrews, provost of the college. It is situated at Dunnoux, three miles from that city. The structure is elevated, and the foundation a solid rock of limestone, of several miles extent.

The building fronts the east, and the lower range of windows and doors are twenty-three in number. In the centre is a noble dome of three stories high, with a moveable roof for the equatorial instrument, which is placed upon a pillar of sixteen feet square, of the most substantial masonry, and surrounded by a circular wall, a

foot distance, that supports the moveable dome, and also the floors, which in no part touch the pillar: thus no motion of the floor or wall can be communicated to the instrument. The aperture for observation in the dome is two feet and a half wide.

On each side of the centre building are two handsome edifices, of two stories high, for the residence of the professor, and to each is attached a wing of one story only, but terminated with domes of two stories. These domes are intended for occasional observations, such as of eclipses, occultations, and comets. But the most important erection of this establishment is behind the main building, and at right angles to it, in order to obtain an uninterrupted view north and south. This is the meridian or transit room, which contains both the transit instrument and the circle. It is thirty-seven feet long, twenty-three broad, and twenty-one high. Fine pillars of Portland stone are erected for both instruments on the most firm basis, and the floor is so framed as to let all the pillars rise totally detached from it; and such was the first professor Dr. Usher's attention to extreme accuracy, that he first ascertained the pillars to be perfectly homogeneous, lest any variety in their substance might admit of a difference in their expansion or contraction by heat, cold, or other changes of atmosphere. The clocks are attached to pillars of the greatest steadiness; they were made by Arnold, who exerted his best skill, and are finished in a masterly manner: the pallets are of ruby; and all the last holes of the movement jeweled; the suspension springs are of gold, with Arnold's own five-barred pendulum, and cheeks capable of experimental adjustment, so as to make all vibrations isochronal, whatever may be the excursion of the pendulum. Around the dome is a platform commanding one of the most extensive and varied prospects that can be imagined.

OBSESSION, *n. s.* } *Lat. obsessio, obsidio.*
OBSESSIONAL, *adj.* } *alis.* The act of besieging: belonging to a siege.

OBSIDIAN, or **OBSIDIANUS LAPIS**, in the natural history of the ancients, the name of a stone which they have also described under the name of the Chian marble. It is a very smooth and hard marble, extremely difficult to cut, but capable of a fine polish; and was used among the ancient Greeks for the purpose of making reflecting mirrors. The name obsidianus seems only a false spelling of the word opsiānus, *απο το οψιανω*, from seeing the images of things in it.

OBSOLETE, *adj.* } *Lat. obsoletus.* Grown
OBSELETENESS, *n. s.* } out of fashion or use; disused.

Obsolete words may be laudably revived, when they are more sounding, or more significant than those in practice. *Dryden.*

What if there be an old dormant statue or two against him, are they not now *obsolete*? *Suiff.*

And Echo learns politely to repeat

The praise of names for ages *obsolete*. *Cowper.*

OBSOPEUS (John), a German physician, born at Brettin in the Palatinate, in 1556. He was educated at Neunhaufs, and at Heidelberg, under Zacharius Ursinus. He studied physic at Frankfort on the Maine, and, after travelling

through England and Holland, was made professor of medicine at Heidelberg. He published several works, and died in 1596, aged forty.

OSORÆUS (Simon), brother to John, born in 1575, also acquired reputation as a physician, and became professor at Heidelberg, where he published some tracts, and died in 1619, aged forty-four.

OBSTACLE, *n. s.* Fr. *obstacle*; Lat. *obstaculum*. Obstruction; hindrance; something opposed.

Conscience is a blushing shame-faced spirit,
That mutinies in a man's bosom; it fills
One full of *obstacles*. *Shakespeare. Richard III.*

If all *obstacles* were cut away,
And that my path were even to the crown,
As the right reverence and due of birth.

Shakespeare.

Disparity in age seems a greater *obstacle* to an intimate friendship than inequality of fortune. For the humours, business, and diversions, of young and old, are generally very different. *Collier.*

The thing I am most afraid of is fear; and with good reason, that passion alone being able to create and magnify *obstacles*. *Steele.*

Some conjectures about the origin of mountains and islands, I am obliged to look into that they may not remain as *obstacles* to the less skilful.

Woodward's Natural History.

What more natural and usual *obstacle* to those who take voyages, than winds and storms. *Pope.*

OBSTETRIC, *adj.* } Latin *obstetric*.
OBSTETRICAL, *n. s.* } Pertaining to, or performing, a midwife's office. *Obstetrication*, the office of a midwife.

There all the learned shall at the labour stand,
And Douglas lend his soft *obstetric* hand. *Pope.*

OBSTETRIC ART, or **OBSTETRICS**, the same with midwifery.

OBSTINATE, *adj.* } Lat. *obstinatus*. Re-
OBSTINACY, *n. s.* } solute; firm; unmoved;
OBSTINATELY, *adv.* } stubborn. 'Absolutely
OBSTINATENESS, *n. s.* } used,' says Dr. Johnson,
'it has an ill sense; relatively, it is neutral.'
Obstinacy and obstinateness (the last rarely used) signify firmness; stubbornness; pertinacity. *Obstinately* follows the meaning of obstinate.

Yield,

Except you mean with *obstinate* repulse,
To slay your sovereign. *Shakespeare.*

The queen is *obstinate*,
Stubborn to justice, apt to accuse it, and
Disdainful to be tried by't. *Id. Henry VIII.*

Chasing rather to use extremities, which might drive me to desperate *obstinacy*, than apply moderate remedies. *King Charles.*

Pembroke abhorred the war as *obstinately* as he loved hunting and hawking. *Clarendon.*

Animosity raised by such usage rendereth him invincibly *obstinate* in his conceits and courses.

Barrow.

I have known great cures done by *obstinate* resolutions of drinking no wine. *Temple.*

Her father did not fail to find,
In all she spoke, the greatness of her mind;
Yet thought she was not *obstinate* to die,
Nor deemed the death she promised was so nigh.
Dryden.

A Greek made himself their prey,
T' impose on their belief, and Troy betray;
Fixed on his aim, and *obstinately* bent
To die undaunted, or to circumvent. *Id.*

Most writers use their words loosely and uncertainly, and do not make plain and clear deductions of words one from another, which were not difficult to do, did they not find it convenient to shelter their ignorance, or *obstinacy*, under the obscurity of their terms. *Locke.*

The man resolved, and steady to his trust,
Inflexible to will, and *obstinately* just,
Can the rude rabble's influence despise.

Addison.

My spouse maintains her royal trust,
Tho' tempted chaste, and *obstinately* just.

Pope.

What crops of wit and honesty appear,
From spleen, from *obstinacy*, hate or fear. *Id.*
At twenty she mocks at the duty you taught her,
Oh what a plague is an *obstinate* daughter.

Sheridan.

OBSTREPEROUS, *adj.* } Lat. *obstreperus*.
OBSTREPEROUSLY, *adv.* } Clamorous; loud;
OBSTREPEROUSNESS, *n. s.* } noisy: the adverb and noun-substantive correspond.

These *obstreperous* scepticks are the bane of divinity, who are so full of the spirit of contradiction, that they raise daily new disputes. *Howel.*

These *obstreperous* villains shout, and know not for what they make a noise. *Dryden.*

The players do not only connive at his *obstreperous* approbation, but repair at their own cost whatever damages he makes. *Addison.*

OBSTRUCTION, *n. s.* Lat. *obstructus*. Obligation; bond.

He hath full right to exempt
Whom so it pleases him by choice,
From national *obstruction*. *Milton.*

OBSTRUCT, *v. a.* } Latin *obstruo*.
OBSTRUCTER, *n. s.* } Strictly to stop
OBSTRUCTION, } up by building
OBSTRUCTIVE, *adj. & n. s.* } against; to block
OBSTRUCTENT. } up; bar; barrier.

Obstruct; oppose; retard: an obstructer is he who hinders or opposes: obstruction, the act of hindering, opposing, or impeding; also the hindrance; obstacle; impediment; Shakespeare has used it for any thing heaped together: obstructive and obstruct mean, causing hindrance; blocking up.

Aye, but to die, and go we know not where;
To lie in cold *obstruction*, and to rot;
This sensible warm motion to become
A kneaded clod.

Shakespeare. Measure for Measure.

All *obstructions* in parliament, that is, all freedom in differing in votes, and debating matters with reason and candour, must be taken away.

King Charles.

Having thus separated this doctrine of God's pre-determining all events from three other things confounded with it, it will now be discernible how noxious and *obstructive* this doctrine is to the super-structing all good life. *Hammond.*

The second *obstructive* is that of the fiduciary, that faith is the only instrument of his justification, and excludes good works from contributing any thing toward it. *Id.*

In his winter-quarters the king expected to meet with all the *obstructions* and difficulties his enraged enemies could lay in his way. *Clarendon.*

Sure God by these discoveries did design
That his clear light thro' all the world should shine;
But the *obstruction* from that discord springs,
The prince of darkness makes 'twixt Christian kings.

Denham.

No cloud interposed,

Or star to obstruct his sight. *Milton.*

They who think too well of their own performances are apt to boast in their preface how little time their works have cost them, and what a number of *obstructions* they have met with. *Dryden.*

Roughly handling is apt to defeat or obstruct the cure. *Barrow.*

In their passage through the glands in the lungs, they obstruct and swell them with little tumours. *Blackmore.*

Fat people are subject to weakness in fevers, because the fat, melted by feverish heat, obstructs the small canals. *Arbuthnot.*

Obstruction denotes the blocking up of any canal in the human body, so as to prevent the flowing of any fluid through it, on account of the increased bulk of that fluid, in proportion to the diameter of the vessel. *Quincy.*

Whenever a popular assembly, free from obstructions, and already possessed of more power than an equal balance will allow, shall continue to think that they have not enough, I cannot see how the same causes can produce different effects among us, from what they did in Greece and Rome. *Swift.*

I would recommend our rising actresses never to take notice of the audience, let the spectators applaud ever so loudly, except at the end of the epilogue for mere obstructions. *Goldsmith.*

A transition from an author's book to his conversation is too like the entrance into a large city. Remotely we see nothing but spires of temples and turrets of palaces, but, when we have entered, we find it perplexed with passages, disgraced with despicable cottages, embarrassed with obstructions, and clouded with smoke. *Johnson.*

OBSTUPEFACTION, *n. s.* } *Lat. obstupe-*
OBSTUPEFACTIVE, *adj.* } *facio. Stupid-*
ity; the act of inducing stupidity; stupefying. *the force of it is obstupefactive, and no other.* *Abbot.*

OBTAIN, *v. a. & v. n.* } *Fr. obtenir; Lat.*
OBTAIN'ABLE, *adj.* } *obtineo. To acquire;*
OBTAIN'ER, *n. s.* } *procure; gain: as a*
neuter verb, to be or continue in use; be established; prevail: obtainable is, procurable; to be gained: obtainer, he who obtains. *Abbot.*

May be that I may obtain children by her. *Genesis.*
We have obtained an inheritance. *Ephes. i. 11.*

By his own blood he entered in once into the holy place, having obtained eternal redemption for us. *Hebrews ix. 12.*

In such our prayers cannot serve us as means to obtain the thing we desire. *Hooker.*

If they could not be obtained of the proud tyrant, then to conclude peace with him upon any conditions. *Knolles.*

There is due from the judge to the advocate some commendation, where causes are fairly pleaded; especially towards the side which obtaineth not. *Bacon.*

The conclusion of the story I forbore, because I could not obtain from myself to shew Absalom unfortunate. *Dryden.*

Our impious use no longer shall obtain,
Brothers no more by brothers shall be slain. *Id.*

Whatever once is denied them, they are certainly not to obtain by crying. *Locke on Education.*

What thinks he of his redemption, and the rate it cost, not being obtainable unless God's only Son would come down from heaven, and be made man, and pay down his own life for it? *Kettlewell.*

The Theodosian code, several hundred years after Justinian's time, did obtain in the western parts of Europe. *Baker.*

Where wasting the publick treasure has obtained in a court, all good order is banished. *Davenant.*

The situation of the sun and earth, which the theorist supposes is so far from being preferable to this which at presents obtains, that this hath infinitely the advantage of it. *Woodward.*

The juices of the leaves are obtained by expression. *Arbuthnot.*

Spirits which come over in distillations, miscible with water, and wholly combustible, are obtainable from plants by previous fermentation. *Id.*

The general laws of fluidity, elasticity, and gravity, obtain in animal and inanimate tubes. *Chayne.*

OBTEND', *v. a.* } *Lat. obtendo. To oppose;*

OBTEN'SION, *n. s.* } *propose; offer as a reason.*

Thou dost with lies the throne invade,
Obtending Heaven for whate'er ills befall. *Dryden.*

OBTENEBRATION, *n. s.* } *Lat. ob and tene-*
bra, darkness. The state of being in the dark; the act of darkening; darkness; cloudiness.

In every meagrim or vertigo there is an obtenebration joined with a semblance of turning round. *Bacon.*

OBTEST', *v. a.* } *Lat. obtestor. To beseech;*

OBTES'TATION. } *supplicate.*

Suppliants demand

A truce, with olive branches in their hand;

Obtest his clemency, and from the plain

Beg leave to draw the bodies of their slain. *Dryden.*

OBTRUDE', *v. a.* } *Lat. obtrudo. To thrust*
OBTRU'DER, *n. s.* } *or force upon; hence,*
OBTRU'SION, } *thrust into any place;*
OBTRU'SIVE, *adj.* } *impose one's company;*
urge or offer with unreasonable eagerness: the obtruder is he who obtrudes: obtrusion, the act or instance of obtruding: obtrusive, disposed to obtrude or intrude.

It is their torment that the thing they shun doth follow them, truth, as it were, even obtruding itself into their knowledge, and not permitting them to be so ignorant as they would be. *Hooker.*

There may be as great a vanity in retiring and withdrawing men's conceits from the world as in obtruding them. *Bacon.*

Some things are easily granted; the rest ought not to be obtruded upon me with the point of the sword. *King Charles.*

Who can abide that against their own doctors six books should, by their fatherhoods of Trent, be, under pain of a curse, imperiously obtruded upon God and his church? *Hall.*

Why shouldst thou then obtrude this diligence in vain, where no acceptance it can find? *Milton.*

Whatever was not by them thought necessary, must not by us be obtruded on, or forced into that catalogue. *Hammond.*

Do justice to the inventors or publishers of the true experiments, as well as upon the obtruders of false ones. *Boyle.*

A cause of common error is the credulity of men; that is, an easy assent to what is obtruded, or believing at first ear what is delivered by others. *Browne.*

The objects of our senses obtrude their particular ideas upon our minds, whether we will or no; and the operations of our minds will not let us be without some obscure notions of them. *Locke.*

Whether thy great forefathers came
From realms that bear Vespucio's name;
For so conjectures would *obtrude*,
And from thy painted skin conclude. *Swift*.
This thing of rhyme I ne'er disdain'd to own,
Though not *obtrusive*, yet not quite unknown.

Byron.

OBTUND', *v. a.* Lat. *obtundo*. To blunt;
dull; quell.

Avicen countermands letting blood in cholerick
bodies, because he esteems the blood a bridle of
gall, *obtusand* its acrimony, and fierceness.

Harvey.

The most pertinacious and vehement demonstrator
may be wearied, in time, by continual negation, and
incredulity, which an old poet, in his address to Ra-
leigh, calls 'the wit of fools,' *obtunds* the argu-
ments which it cannot answer, as woofsacks deaden
arrows, though they cannot repel them. *Johnson*.

OBTUSE', *adj.* Lat. *obtusus*. Blunt or
OBTUSANGULAR, broken at the point; not
OBTUSELY, acutely pointed; hence
OBTUSENESS, dull; stupid: obtusangular,
OBTUSION, having an angle or angles
larger than a right angle: obtusely, without
point; stupidly: obtuseness and obtusion, the
act of dulling or blunting, or state of being
dulled or stupid.

Thy senses then

Obtuse, all taste of pleasures must forego.

Milton.

Obtusion of the senses, internal and external.

Harvey.

A national taste cannot be wholly changed at
once; we must yield a little to men's *obtus* minds and
we may then bring them by degrees to adopt what
would offend them if attempted to be introduced by
violence. *Sir J. Reynolds*.

OBVENTION, *n. s.* Lat. *obvenio*. Acci-
dental advantage.

When the country grows more rich, and better in-
habited, the tythes and other *obventions* will also be
more augmented and better valued. *Spenser*.

OBVERT'. Lat. *obverso*. To turn towards.

The laborant with an iron rod stirred the kindled
part of the nitre, that the fire might be more dif-
fused, and more parts might be *obverted* to the air.

Boyle.

A man can from no place behold, but there will
be amongst innumerable superficials, that look some
one way, and some another, enough of them *ob-*
verted to his eye to afford a confused idea of light.

Boyle on Colours.

An erect cone placed in an horizontal plane, at a
great distance from the eye, we judge to be nothing
but a flat circle, if its base be *obverted* towards us.

Watts's Logick.

OBVIATE, *v. a.* } Fr. *obvier*; Lat. *ob-*
OBVIOUS, *adj.* } *vis*. To meet as in the
OBVIOUSLY, *adv.* } way, i. e. contra viam; to
OBVIOUSNESS, *n. s.* } intercept; obvious is
meeting; opposed in front or openly; exposed:
hence easily discovered; plain; evident; natu-
ral: the other words follow these senses.

For France, Spain, and other foreign countries,
the volumes of their laws and lawyers have *obviously*
particulars concerning place and precedence of their
magistrates and dignities. *Selden*.

I to the evil turn

My *obvious* breast; arming to overcome

By suffering, and earn rest from labour won.

Milton.

VOL. XVI.

Whether such room in nature unpossess
Only to shine, yet scarce to contribute
Each orb a glimpse of light, conveyed so far
Down to this habitable, which returns
Light back to them, is *obvious* to dispute. *Id.*
It is *obvious* to discover that imperfections of one
kind, have a visible tendency to produce perfections
of another. *Shenstone*.

Slight experiments are more easily and cheaply
tried; I thought their easiness or *obviousness* fitter to
recommend than depreciate them. *Boyle*.

They are such lights as are only *obvious* to every
man of sense, who loves poetry and understands it.
Dryden.

All purely identical propositions *obviously* and at
first blush contain no instruction. *Locke*.

To lay down every thing in its full light, so as to
obviate all exceptions, and remove every difficulty,
would carry me out too far. *Woodward*.

We may then more *obviously*, yet truly liken the
civil state to bulwarks, and the church to a city.

Holyday.

These sentiments, whether they be impressed on
the soul, or arise as *obvious* reflections of our reason,
I call natural, because they have been found in all
ages. *Rogers*.

All the great lines of our duty are clear and *ob-*
vious; the extent, of it understood, the obligation
acknowledged, and the wisdom of complying with it
freely confessed. *Id.*

I am apt to think many words difficult or obscure,
which are *obvious* to scholars. *Swift*.

Yet how fallacious is all earthly bliss,

What *obvious* truths the wisest hands may miss:

Some pleasures live a month, and some a year,

But short the date of all we gather here;

No happiness is felt, except the true,

That does not charm the more for being new.

Cowper.

OBUMBRATE, *v. a.* Lat. *obumbro*. To
shade; to cloud.

The rays of royal majesty, reverberated so strongly
upon Villorio, dispelled all those clouds which did
hang over and *obumbrate* him. *Howel*.

OBY, or OUBY, an island of the eastern seas,
seems to be a continuation of the chain of Xulla.
The Dutch have, on the west end, a small fort;
and the sultan of Bachian, who claims the sove-
reignty, has a pearl fishery here. Farther north
is the island Mya, formerly well inhabited, and
abounding in clove trees, but which have been
all rooted out. It is of middling height, and
has a good road: clove trees are said to flourish.
Tyfoa Island, north-west of it, is low. Oby Pulo,
is five leagues south of Cambodia Point, in the
east of the Gulf of Siam. It is an island some
miles in extent, and formed of several hills, the
centre one rising to a height to be seen eighteen
leagues. The inhabitants are a few banished
families from the main, who cultivate rice and
maize enough for their subsistence. A stream
of fine water descends from the great mountain,
and empties itself into the sea on the north, where
100 butts of water may be filled in a day. As
water is in the dry season very scarce on the op-
posite coast, a number of junks are kept con-
stantly employed in supplying it from this
stream.

OCANA, an old town of Spain, the capital of
the lower district of la Mancha, situated at the
entrance of a fine plain: but the favorable im-
pression produced at first by groupes of steeples

H

and some large buildings, is entirely destroyed on entering the town, which is in a state of complete decay. It has four churches, and eleven religious houses; but its chief ornaments are two beautiful fountains. The inhabitants, about 5000, manufacture silk, leather, and soap. The vicinity was, on 20th November 1810, the scene of a general action between the French and Spaniards. Eight miles E. S. E. of Aranjuez, and thirty S. S. E. of Madrid.

OCATAHOOLA, a river of the United States, in Louisiana. It runs S. S. E. through the greatest part of its course; then east, passing through a lake of the same name, and joining the Ouachitta at the junction of the Tensaw.

OCCA'SION, *n. s. & v. a.* Fr. *occasion*; OCCA'SIONAL, *adj.* Lat. *occasio*. Sea-son; opportunity; OCCA'SIONALLY, *adv.* incident; OCCA'SIONER, *n. s.* convenience; accidental cause, or reason; casual need: to occasion is to cause accidentally; produce without design, or not by direct design or influence: occasional is casual; incidental; produced by accident or exigence: occasionally and occasioner, corresponding in sense.

Because of the money returned in our sacks are we brought in, that he may seek *occasion* to fall upon us, and take us for bondmen. Gen. xliii. 18.

Use not liberty for an *occasion*. Gal. v. 13.

She with true lamentations made known to the world, that her new greatness did no way comfort her in respect of her brother's loss, whom she studied all means possible to revenge upon every one of the *occasioners*. Sidney.

Me unwetting, and unaware of such mishap, She brought to mischief through *occasion*, Where this same wicked villain did me light upon. Spenser.

Have you ever heard what was the *occasion* and first beginning of this custom? Spenser on Ireland.

The laws of Christ we find rather mentioned by *occasion* in the writings of the apostles, than any solemn thing directly written to comprehend them in legal sort. Hooker.

My *occasions* have found time to use them toward a supply of money. Shakspeare.

Your business calls on you,

And you embrace the *occasion* to depart. Id.

That woman that cannot make her fault her husband's *occasion*, let her never nurse her child herself, for she will breed it like a fool. Id.

Some men will load me as if I were a wilful and resolved *occasioner* of my own and my subjects' miseries. King Charles.

Authority and reason op her wait,

As one intended first, not after made

Occasionally. Milton's *Paradise Lost*.

Let me not let pass

Occasion which now smiles. Id.

In case a man dig a pit and leave it open, whereby it happeneth his neighbour's beast to fall thereinto and perish, the owner of the pit is to make it good, inasmuch as he was the *occasioner* of that loss to his neighbour. Sanderson.

The ground or *occasional* original hereof, was the amazement and sudden silence the unexpected appearance of wolves does often put upon travellers. Browne's *Vulgar Errors*.

With a mind as great as theirs he came

To find at home *occasion* for his fame,

Where dark confusions did the nations hide. Waller.

I doubt not whether the great increase of that disease may not have been *occasioned* by the custom of much wine introduced into our common tables. Temple.

The fair for whom they strove,
Nor thought when she beheld the fight from far,
Her beauty was the *occasion* of the war. Dryden.

They who are desirous of a name in painting, should read with diligence, and make their observations of such things as they find for their purpose, and of which they may have *occasion*. Id.

Those letters were not writ to all;
Nor first intended but *occasional*,
Their absent sermons.

Id. *Hind and Panther*.

If we enquire what it is that *occasions* men to make several combinations of simple ideas into distinct modes, and neglect others which have as much an aptness to be combined, we shall find the reason to be the end of language. Locke.

Who can find it reasonable that the soul should, in its retirement, during sleep, never light on any of those ideas it borrowed, not from sensation, preserve the memory of no ideas but such, which, being *occasioned* from the body, must needs be less natural to a spirit? Id.

From this admonition they took only *occasion* to redouble their fault, and to sleep again. South.

Thus much is sufficient out of scripture, to verify our explication of the deluge, and according to the Mosaical history of the flood, according to many *occasional* reflections dispersed in other places of scripture concerning it. Burnet.

The ancient canons were very well fitted for the *occasion* of the church in its purer ages. Baker.

A consumption may be *occasioned* by running sores, or sinuous fistulas, whose secret caves and winding burrows empty themselves by copious discharges. Blackmore.

The good Psalmist condemns the foolish thoughts, which a reflection on the prosperous state of his affairs had sometimes *occasioned* in him. Atterbury.

This one has *occasion* of observing more than once in several fragments of antiquity, that are still to be seen in Rome. Addison.

Besides these constant times there are likewise *occasional* times for the performance of this duty. Duty of Man.

I have endeavoured to interweave with the assertions some of the proofs whereon they depend, and *occasionally* scatter several of the more important observations throughout the work. Woodward.

By its stypitic quality it affects the nerves, very often *occasioning* tremors. Arbuthnot on *Aliments*.

A prudent chief not always must display,
His powers in equal ranks, and fair array,
But with the *occasion* and the place comply,
Conceal his force, nay, seem sometimes to fly. Pope.

God hath put us into an imperfect state, where we have perpetual *occasion* of each other's assistance. Srijl.

Love or of force or of persuasion
Avails him as best suits the *occasion*,
And all who've felt his tingling dart
Will own his conquest o'er the heart. Sheridan.

OCCECATION, *n. s.* Lat. *occacatio*, from *occaco*. The act of blinding or making blind.

Those places speak of obduration and *occacation*, so as if the blindness that is in the minds, and hardness that is in the hearts of wicked men, were from God. Sanderson.

OCCIDENT, *n. s.* } Lat. *occidens*, *occiden-*
OCCIDENTAL, *adj.* } *talis*. The west ; west-
OCCIDUOUS. } ern.

The envious clouds are bent
 To dim his glory, and to stain the tract
 Of his bright passage to the *occident*.

Shakespeare.

Ere twice in muck and *occidental* damp,
 Moist Hesperus hath quenched his sleepy lamp.

Id.

If she had not been drained she might have tiled
 her palaces with *occidental* gold and silver. *Howel.*

East and west have been the obvious conceptions
 of philosophers, magnifying the condition of India
 above the settling and *occidental* climates. *Brown.*

OCCIPUT, *n. s.* } Lat. *occiput*, *occipitalis*.
OCCIPITAL, *adj.* } The back of the head ;
 pertaining to or placed in the back of the head.
 His broad-brimmed hat

Hangs o'er his *occiput* most quaintly,
 To make the knave appear more saintly.

Butler.

OCCIPUT, in anatomy, os memoriz, os nervo-
 rum, or os basuare, the name given to that bone
 which forms the posterior and inferior part of
 the skull. It is of an irregular figure, convex on
 the outside, and concave internally. Its external
 surface is very irregular, and thus serves for the
 attachment of several muscles. The inferior
 portion of the bone is stretched forward in form
 of a wedge, whence it is called the cuneiform,
 or basiliary process. At the base of this process,
 situated obliquely on each side of the foramen
 magnum, are two flat oblong protuberances,
 named condyles. They are covered with cartil-
 age, and serve for the articulation of the head
 with the first vertebra of the neck. At the basis
 of the cranium, and immediately behind the
 cuneiform process, there is a considerable hole,
 through which the medulla oblongata, the nervi
 accessorii, and the vertebral arteries, pass into the
 spine. Man being designed for an erect posture,
 this foramen magnum is found nearly in the
 middle of the basis of the human cranium, and
 at a pretty equal distance from the posterior
 part of the occiput, and the anterior part of the
 lower jaw ; whereas in quadrupeds it is nearer
 the back part of the occiput.

This bone is thicker and stronger than any
 other of the bones of the head, except the petrous
 parts of the ossa temporum. The reason for this
 seems to be that it covers the cerebellum, in
 which any wound is of the utmost consequence,
 and that it is, by its situation, more liable to be
 fractured by falls than any other bone of the
 cranium. For if we fall forwards the hands are
 naturally put out to prevent the forehead's touch-
 ing the ground ; and if on one side the shoulders
 in a great measure protect the sides of the head ;
 but if a person falls backwards the hind part of
 the head consequently strikes against the earth,
 and that too with considerable violence. Nature
 therefore has wisely constructed this bone so as
 to be capable of the greatest strength at its upper
 part, where it is most exposed to injury. See

ANATOMY, Index.

OCCLUDE, *v. a.* } Lat. *occludo*. To en-
OCCLUSE, *adj.* } close ; shut up : occlude
OCCLUSION, *n. s.* } is enclosed : occlusion,
 the act of shutting up

They take it up, and roll it upon the earths,
 whereby *occluding* the pores they conserve the natural
 humidity, and so prevent corruption. *Brown.*

The appulse is either plenary and *occlusus*, so as to
 preclude all passages of breath or voice through the
 mouth ; or else partial and pervious, so as to give
 them some passages out of the mouth. *Holder.*

OCCOA, a river of Hispaniola, which runs
 into the sea, and forms a bay on the south coast,
 to which it gives name, west of Point Salinas.

OCCOA, a bay at the eastern extremity of the
 island of Cuba.

OCCULT, *adj.* } Fr. *oculte* ; Lat. *oc-*
OCCULTATION, *n. s.* } *cultus*. Obscure ; se-
OCCULTNESS. } cret ; hidden ; un-

known : occultation, in astronomy, is the time
 that a star or planet is hid from our sight by the
 interposition of the body of the moon, or some
 other planet : occultness, secretness ; the state of
 being hid.

If this *occult* guilt

Do not itself unkennel in one speech,
 It is a damned ghost that we have seen.

Shakespeare.

An artist will play a lesson on an instrument
 without minding a stroke ; and our tongues will run
 divisions in a tune not missing a note, even when our
 thoughts are totally engaged elsewhere : which ef-
 fects are to be attributed to some secret act of the
 soul, which to us is utterly *occult*, and without the
 ken of our intellects. *Glanville.*

These instincts we call *occult* qualities ; which is
 all one with saying that we do not understand how
 they work. *L'Estrange.*

These are manifest qualities, and their causes only
 are *occult*. And the Aristotelians give the name of
occult qualities not to manifest qualities, but to such
 qualities only as they suppose to lie hid in bodies,
 and to be the unknown causes of manifest effects.

Newton's Opticks.

OCCUPANCY, *n. s.* } Lat. *occupo*. The
OCCUPANT, } act of taking or keep-
OCCUPATE, *v. a.* } ing possession : an
OCCUPATION, *n. s.* } occupant is he who
OCCUPIER, } takes or keeps pos-
OCCUPY, *v. a. & v. n.* } session : occupy, to
 possess ; hold : occupation, the act of taking or
 holding possession : hence employment ; busi-
 ness ; avocation : an occupier is a possessor ;
 one who follows any employment or calling : to
 occupy, to possess ; keep ; hold ; take up ; give
 employment to ; follow as a business ; use ;
 spend ; apply.

All the gold *occupied* for the work was twenty and
 nine talents. *Exod. xxxviii. 2.*

Thy merchandise and the *occupiers* of thy mer-
 chandise shall fall into the midst of the seas.

Ezek. xxvii. 27.

He called his ten servants, and delivered them ten
 pounds, and said unto them, *Occupy* till I come.

Luke xix. 13.

He was of the same craft with them, and wrought,
 for by their *occupation* they were tent-makers. *Acts.*

How shall he that *occupieth* the room of the un-
 learned say Amen at thy giving of thanks, seeing he
 understandeth not what thou sayest ?

1 Corinthians.

They *occupied* themselves about the sabbath yield-
 ing exceeding praise to the Lord. *2 Maccabees.*

How can he get wisdom that driveth oxen and is
occupied in their labour, and whose talk is of bul-
 locks ? *Ecclesi. xxxviii. 25.*

H 2

An archbishop may have cause to *occupy* more chaplains than six.

Act of Henry VIII.

They *occupy* their business in deep waters.

Common Prayer.

The red pestilence strikes all trades in Rome, And *occupations* perish.

Shakespeare. Coriolanus.

If the title of *occupiers* be good in a land unpeopled, why should it be bad accounted in a country peopled thinly?

Raleigh.

Of beasts and birds the property passeth with the possession, and goeth to the *occupant*; but of civil people not so.

Bacon.

Drunken men are taken with a plain destitution in voluntary motion; for that the spirits of the wine oppress the spirits animal, and *occupate* part of the place where they are, and so make them weak to move.

Id. Natural History.

Spain hath enlarged the bounds of its crown within this last sixscore years much more than the Ottomans; I speak not of matches or unions, but of arms, *occupations*, invasions.

Bacon.

My *occupations* must vary according to occasions. My end shall be one, and the same now on earth that it must be one day in heaven.

Hall.

In your most busy *occupations*, when you are never so much taken up with other affairs, yet now and then send up an ejaculation to the God of your salvation.

Wake.

Powder being suddenly fired altogether, upon this high rarefaction, requireth a greater space than before its body *occupied*.

Browne.

He must assert infinite generations before that first deluge; and then the earth could not receive them, but the infinite bodies of men must *occupy* an infinite space.

Bentley's Sermons.

Of moveables, some are things natural; others, things artificial. Property in the first is gained by *occupancy*, in the latter by improvement.

Warburton.

Such were the distresses of the then infant world, so incessant their *occupations* about provision for food, that there was little leisure to commit any thing to writing.

Woodward.

There was deep silence in the chamber: dim

And distant from each other burned the lights, And slumber hovered o'er each lovely limb

Of the fair *occupants*.

Byron.

OCCUPANCY, in law, is the taking possession of those things which before belonged to nobody. This, says judge Blackstone, is the true ground and foundation of all property, or holding those things in severalty, which, by the law of nature, unqualified by that of society, were common to all mankind. But, when once it was agreed that every thing capable of ownership should have an owner, reason suggested that he who could first declare his intention of appropriating any thing to his own use, and, in consequence of such his intention, actually took it into possession, should thereby gain the absolute property of it; according to that rule of the law of nations, recognised by the laws of Rome, *Quod nullius est, id ratione naturali occupanti conceditur*. This right of occupancy, so far as it concerns real property, has been confined by the laws of England within a very narrow compass: and was extended only to a single instance; namely, where a man was tenant pour autre vie, or had an estate granted to himself only for the life of another man, and died during the life of cestuy que vie, or him by whose life it was holden: in this case he that could first enter on the land might law-

fully retain the possession so long as cestuy que vie lived by right of occupancy. This seems to have been recurring to first principles, and calling in the law of nature to ascertain the property of the land when left without a legal owner. For it did not revert to the grantor, who had parted with all his interest, so long as cestuy que vie lived; it did not escheat to the lord of the fee, for all escheats must be of the absolute entire fee, and not of any particular estate carved out of it, much less of so minute a remnant as this; it did not belong to the grantee, for he was dead; it did not descend to his heirs, for there were no words of inheritance in the grant; nor could it vest in his executors, for no executors could succeed to a freehold. Belonging therefore to nobody, like the *hereditas jacens* of the Romans, the law left it open to be seized and appropriated by the first person that could enter upon it, during the life of the cestuy que vie, under the name of an occupant. But there was no right of occupancy allowed where the king had the reversion of the lands; for the reversioner has an equal right with any other man to enter upon the vacant possession; and, where the king's title and a subject's interfere, the king's shall always be preferred. Against the king, therefore, there could be no prior occupant, because *nullum tempus occurrit regi*. And, even in the case of a subject, had the estate pour autre vie been granted to a man and his heirs during the life of cestuy que vie, there the heir might, and still may, enter and hold possession, and is called in law a special occupant; as having a special exclusive right, by the terms of the original grant, to enter upon and occupy this *hereditas jacens*, during the residue of the estate granted; though some have thought that such estate is rather a descendible freehold. But the title of common occupancy is now reduced almost to nothing by two statutes; the one 29 Car. II. c. 3, which enacts that where there is no special occupant, in whom the estate may vest, the tenant pour autre vie may devise it by will, or it shall go to the executors, and be assets in their hands for payment of debts; the other, that of 14 Geo. II. c. 20, which enacts that it shall vest not only in the executors, but, in case the tenant dies intestate, in the administrators also; and go in course of a distribution like a chattel interest. By these two statutes the title of common occupancy is utterly extinct and abolished: though that of special occupancy, by the heir at law, continues to this day: such heir being held to succeed to the ancestor's estate, not by descent, for then he must take an estate of inheritance, but as an occupant, specially marked out and appointed by the original grant. For the statutes must not be construed so as to create any new estate, or to keep that alive which, by the common law, was determined, and thereby to defeat the grantor's reversion; but merely to dispose of an interest in being, to which by law there was no owner, and which therefore was left open to the first occupant. When there is a residue left the statutes give it to the executors, &c., instead of the first occupant; but they will not create a residue on purpose to give it to the executors. So also, in some cases, where the laws of other nations give

a right by occupancy, as in lands newly created, by the rising of an island in a river, or by the alluvion or dereliction of the sea; in these instances the law of England assigns them an immediate owner. For Bracton tells us that if an island arise in the middle of a river it belongs in common to those who have lands on each side thereof; but, if it be nearer to one bank than the other, it belongs only to him who is proprietor of the nearest shore; which is agreeable to the civil law. Yet this seems only to be reasonable where the soil of the river is equally divided between the owners of the opposite shores; for if the whole soil is the freehold of any one, as it must be whenever a several fishery is claimed, there it seems just (and so is the practice) that the islets arising in any part of the river shall be the property of him who owneth the piscary and the soil. However in case a new island arise in the sea, though the civil law gives it to the first occupant, yet ours gives it to the king. And as to lands gained from the sea, either by alluvion, by the washing up of sand and earth, so as in time to make terra firma; or by dereliction, as when the sea shrinks back below the usual water-mark; in these cases the law is held to be, that if this gain be by little and little, by small and imperceptible degrees, it shall go to the owner of the land adjoining. For *de minimis non curat lex*: and besides, these owners being often losers by the breaking in of the sea, or at charges to keep it out, this possible gain is therefore a reciprocal consideration for such possible charge or loss. But, if the alluvion or dereliction be sudden and considerable, in this case it belongs to the king; for as the king is lord of the sea, and so owner of the soil while it is covered with water, it is but reasonable he should have the soil when the water has left it dry. So that the quantity of ground gained, and the time during which it is gained, are what make it either the king's or the subject's property. In the same manner, if a river, running between two lordships, by degrees gains upon one, and thereby leaves the other dry; the owner who loses his land thus imperceptibly has no remedy; but if the course of the river be changed by a sudden and violent flood, or other hasty means, and thereby a man loses his ground, he shall have what the river has left in any other place as a recompense for this sudden loss. And this law of alluvions and derelictions with regard to rivers is nearly the same in the imperial law; whence indeed those our determinations seem to have been drawn and adopted: but we ourselves, as islanders, have applied them to marine increases, and have given our sovereign the prerogative he enjoys, as well upon the particular reasons before-mentioned as upon this other general ground of prerogative, formerly remarked, that whatever has no other owner is vested by the law in the king. See *PREROGATIVE*.

OCCUR, *v. n.* } Lat. *occurro*; Fr. *occurrence*. To come to meet.
OCCURRENCE, *n. s.* } *currance*. To come to meet.
OCCURRENT, *adj.* } mory; appear here and there; clash; strike
OCCURSION, *n. s.* } against; intercept: occurrence (from the Fr.) is, incident; accidental event: occurrent, incident: occursion, accidental blow; clash.

Contentions were as yet never able to prevent two evils, the one a mutual exchange of unseemly and unjust disgraces, the other a common hazard of both, to be made a prey by such as study how to work upon all *occurrences*, with most advantage in private.

Hooker.

He did himself certify all the news and *occurrences* in every particular, from Calice, to the mayor and aldermen of London.

Bacon.

There doth not occur to me any use of this experiment for profit.

Id. *Natural History*.

So pleasing is the vicissitude of things that the intercourse even of those *occurrences* which in their own nature are less worthy, gives more contentment than the unaltered estate of better.

Bp. Hall.

In the resolution of bodies, by fire, some of the dissipated parts may, by their various *occursion* occasioned by the heat, stick closely.

Boyle.

Now should those active particles, ever and anon justled by the *occursion* of other bodies, so orderly keep their cells without alteration of site.

Glanville.

In education most time is to be bestowed on that which is of the greatest consequence in the ordinary course and *occurrences* of that life the young man is designed for.

Locke.

The mind should be always ready to turn itself to the variety of objects that *occur*, and allow them as much consideration as shall be thought fit.

Id.

Bodies have a determinate motion according to the degrees of their external impulse, their inward principle of gravitation, and the resistance of the bodies they *occur* with.

Bentley.

Before I begin that, I must *occur* to one specious objection against this proposition.

Id.

Voyages detain the mind by the perpetual *occurrence* and expectation of something new.

Watts.

The far greater part of the examples that *occur* to us are so many encouragements to vice and disobedience.

Rogers.

OCEAN, *n. s. & adj.* } Fr. *ocean*; Lat. *oceanus*.
OCEANIC. } *amus*. The main sea;
 any great expanse: ocean is classically used by Milton in the sense of oceanic, i. e. pertaining to the ocean.

The golden sun salutes the morn,
 And, having gilt the ocean with his beams,
 Gallops the zodiack. *Shakspeare*.
 Will all great Neptune's ocean wash this blood
 Clean from my hand? *Id. Macbeth*.

In bulk as huge as that sea-beast,
 Leviathan, which God of all his works
 Created hugest that swims the' ocean stream.

Milton.

Bounds were set

To darkness, such as bound the ocean wave. *Id.*
 Time, in general, is to duration, as place to expansion. They are so much of those boundless oceans of eternity and immensity, as is set out and distinguished from the rest, to denote the position of infinite real beings, in those uniform, infinite oceans of duration and space.

Locke.

And I have loved thee Ocean, and my joy
 Of youthful sports was on thy breast to be
 Borne like thy bubbles onward: from a boy
 I wantoned with thy breakers. *Byron*.

Hear! hear Prometheus from his rock appeal
 To earth, air, ocean, all that felt or feel.
 His power and glory; all who yet shall hear
 A war eternal as the rolling year. *Id.*

So some tall rock, whose bare broad bosom high
 Towers from the earth, and braves the' inclement sky;
 On whose vast top the blackening deluge pours,
 At whose wide base the thundering ocean roars,

In conscious pride its huge gigantic form
Surveys imperious, and defies the storm. *Canning.*

OCEAN. The oceans of the globe occupy, collectively, about six-tenths of the earth's surface. See our article GEOGRAPHY. We have in that article considered the immense body of ter-

restrial waters as divisible into two great basins, which we have called the GREAT ATLANTIC and the GREAT PACIFIC basins. This outline is in a manner followed by the late celebrated Malte Brun in his *Precis de la Geographie Universelle*: the following is his exact sketch:—

- | | | | | |
|--|---|------------------------------------|---|---|
| A. he calls 'The Great Southern Basin,' occupying the greater part of the aquatic hemisphere of the globe. | { | 1. Southern Ocean. | { | Its frontier may be fixed by a line drawn from Cape Horn to the Cape of Good Hope; thence to Van Diemen's Land, and returning by the south of New Zealand to Cape Horn. |
| | | 2. Eastern or Great Pacific Ocean. | | <p>a. The great Archipelago, or the part comprised between New Zealand on the south, the Marquesas on the east, the island of Formosa on the north, and the strait of Malacca on the west.</p> <p>b. The North-Eastern Ocean, between Asia and North America. The seas of Japan, of Kamtschatka, and Beering's Strait, make a part of it.</p> <p>c. The South-Eastern Ocean, stretching from the islands of the great Archipelago to South America.</p> |
| | | 3. Indian Ocean. | | <p>With its various gulfs. The limits above indicated show what remains for this section of the great eastern basin. The Red Sea, or Arabian Gulf, the Persian Gulf, and the Bay of Bengal, form part of this division.</p> |
| B. the 'Western Basin,' forming a kind of channel between the two great continents | { | 4. Western Ocean. | { | <p>a. North Sea. It is separated from the Atlantic on the south-west by the Straits of Dover, Great Britain, the Islands of Faroe and Iceland. The Baltic with its gulfs, and the northern Frozen Ocean, constitute parts of this division.</p> <p>b. The Atlantic Ocean, extending from the above line of demarcation to the two nearest points of Brasil and Guinea.</p> |
| | | | | <p>Branches. {</p> <p>1. The Mediterranean and its gulfs.</p> <p>2. The Gulf of Mexico, &c.</p> <p>3. Hudson and Baffin's Bay, or the Esquimaux Seas</p> <p>c. Ethiopian Ocean, between Brasil and Africa, as far as the line which joins Cape Horn and the Cape of Good Hope.</p> |

On this it may be observed, that nearly one half of the globe is covered with water, while almost the whole of the land is situated in the other half. If the frozen regions about the south pole, says Mr. Myers, do not contain any large tracts of land, we may, by following the meridian of the Cape of Good Hope through the pole to the environs of Beering's Straits, trace a line of about 200°, which is equal to 4000 marine leagues, or 13,840 English miles. This line, therefore, exceeds half the circumference of the globe by about 400 leagues, and passes wholly over an aquatic surface. A line drawn under the equator through Sumatra and Borneo, to the western coast of America, presents, with only two or three interruptions, an aquatic expanse of 4200 leagues. Again, the fortieth parallel of south latitude exhibits a liquid zone, with only 15° of land, and consequently forming an extent of 5300 leagues, a little less than two-thirds of the whole circumference of the earth. Such is the vast extent of the great southern basin of the terrestrial globe.

The ocean, by its refreshing exhalations contributed to the atmosphere, supports vegetable life, and feeds by its vapors the streams of running water, which, though ever flowing, are never exhausted. According to Dr. Halley, the vapors which arise from the ocean, and which the winds convey to the land, are sufficient to create and replenish all the rivers and other waters at the surface of the earth. Without

the benign influence of its vapors indeed the whole earth would become an inanimate desert; and the drying up of the ocean would probably be alone sufficient to destroy all organised nature. This vast body of water serves also to decompose a great part of the corruptible matter of both the vegetable and animal reigns, while, by opening a boundless field for navigation, it unites nations whom impassable mountains and immense deserts would otherwise have separated for ever.

The *shores* washed by the ocean are of three descriptions. 1. Elevated or rocky, sometimes composed of perpendicular cliffs several hundred feet high. 2. Downs or coasts formed of sand-hills accumulated by the waves and winds. 3. Low, or generally formed by the retiring of the sea.

The irregular *depths* of the ocean prove its bottom to be similar to the surface of the continents, and that if left dry it would in like manner present mountains, valleys, and plains. It is only by this analogy that we can form any estimate of its greatest depth, and this may lead us to conclude that the mountains of the continents correspond with the abysses of the ocean. The greatest depth that had been sounded in 1815 was, according to captain Tuckey, 891 fathoms (by Ellis, in his voyage to Hudson's Bay), without finding bottom. Since this Mr. Scoresby (in June 1817) sounded to the depth of 7200 feet: now the highest mountains exceed

three times this number of feet, and, if we allow half that quantity for their abrasion by the action of the elements since their formation, we may conclude that the greatest depth of the ocean is, perhaps, between 30,000 and 40,000 feet. The depth of the sea near the shores is generally observed to be in proportion to their height and declivity, deep water being found close to elevated and steep shores, and shallow water near low ones. The bottom of the ocean, as far as has been ascertained, is composed of sand, gravel, and rock, mixed with the spoils of testaceous animals and coralligenous substances; in many places these latter cover the bottom so as to resemble petrified forests, while in others masses of granite appear.

The level of the waters of the ocean is, generally speaking, every where the same: hence the ocean taken collectively has a spherical or rather a spheroidal surface which may be considered the true surface of our planet. As exceptions to this general level, it has been pretended that the Baltic and Zuyder Zee are higher than the British Sea, the Red Sea than the Mediterranean, and that there is a difference in the levels of the Atlantic and Pacific Oceans on the opposite sides of the isthmus of the Darien; but the facts on which these suppositions rest are by no means sufficiently verified, and, with respect to the Baltic in particular, the contrary has been proved by recent experiments. It seems, however, probable that gulfs or internal seas open to the East are higher than the main ocean, from the accumulation of waters in them by the constant movement of the sea from east to west.

The water of the ocean, besides pure water, contains many foreign substances, the proportions of which vary in different places: the most common are muriatic acid, sulphuric acid, a fixed mineral alkali, magnesia, and sulphated lime. The degree of *saltness* also varies with the localities, or from adventitious causes, and in many places it has been found to be less at the surface than at a considerable depth. Naturalists have proposed different solutions for the phenomenon of the saltiness of the sea, some supposing it to be caused by primitive banks of salt at the bottom; but, if such banks exist, they are probably rather formed by the deposition of the saline particles of the water, than the cause of its saltiness. Halley and Buffon ascribed it to the corruption of vegetable and animal matter, conveyed to the sea by rivers; for it being certain that the fresh water received by lakes that have no outlet corrupts, is decomposed, and forms depositions of salt, they considered the ocean as a vast lake, the common reservoir of all the fresh waters of the globe. But if this hypothesis were correct the saltiness of the sea must be continually increasing, which there seems to be no reason for supposing. Many naturalists have conceived the ocean to be the residue of a primitive fluid, that held in dissolution all the substances of which the earth is composed, and that, after this fluid had deposited all the earthy and metallic particles, there remained in the residue or actual sea some of the saline elementary principles too intimately combined with the water to escape. The only method of freeing

sea-water from its salt is by distillation; but this process is so tedious, and requires such a quantity of fuel, that it can scarcely ever be carried to sufficient extent to supply the total want of fresh water at sea, though it may considerably protract the arrival of so dreadful a calamity; besides, distillation does not entirely deprive the sea-water of its bitter taste when it contains sal ammoniac. This bitterness, which renders sea-water so nauseous, is found to decrease with the depth, whence it probably proceeds from animal and vegetable matter in a state of decomposition near the surface. Spartman found that sea-water taken from the depth of sixty fathoms had the taste of fresh water in which common salt had been dissolved, and on an analysis it was found to contain an extremely small proportion of magnesia. The analysis of three pounds of water taken up near Aurich, in East Friesland (British Sea), and the same quantity from New Rostock in the Baltic gave:—

| Brit. Sea. Baltic. | |
|------------------------------------|----------|
| Muriate of soda, or common salt | |
| grains | 522 263 |
| Muriate of magnesia, or Epsom salt | 198½ 111 |
| Sulphate of lime, or selenite | 23 12 |
| Sulphate of soda, or Glauber salt | 1½ 1 |
| Residue | 1½ 1 |
| | 746½ 388 |

The following are observations showing considerable differences in the degrees of saltiness in nearly the same places.

From Bergman's Physical Geography.

Though the saltness of the sea considerably aids in preserving it from putrefaction it is not alone sufficient for that purpose, and without the constant motion produced by *winds, tides, and currents*, it would in a short time corrupt, as has been frequently experienced in long calms with-in the tropics.

The general color of the sea in the open ocean is a deep greenish blue: the latter tint, which is predominant, seems to proceed from the same cause that gives an azure color to the atmosphere, and a deeper blue to distant mountains; for, the blue rays being the most refrangible, are reflected in greatest quantity by the aquatic fluid, which, by reason of its density and depth, causes them to undergo a strong refraction. The other shades, which have been observed in the waters of different seas, seem to depend on local causes, and often perhaps on optical illusion; thus the water of the Levant is said at times to have a purple tint, the sea in the Gulf of Guinea to be whitish, and near the Maldiva Islands black. The water of the Gulf of California is reddish, whence its name Vermilion Sea. The changes of color in proceeding from the British Sea to the Frozen Ocean have been noticed by several voyagers; in the first it is the common greenish blue, in the sea of Norway a clear deep blue, and in the Frozen Ocean a deep black. The approach to the coasts of the continents, or of large islands, is generally denoted by the lighter green or yellowish tint of the water denoting being in soundings. The southern seas present at times a phenomenon which terrified their early navigators, who, seeing large spaces of the sea of a blood color, conceived it a portent of some dreadful catastrophe; this appearance, however, seems to be generally produced by a multitude of sea insects of a red color.

The *luminous* appearance of the sea at night is a magnificent and imposing spectacle. When gently agitated, innumerable sparkles of light, some of dazzling brilliancy, others of a silvery white, will group themselves in a thousand forms; but when disturbed the appearance is more tumultuously grand, waves of fire rising, rolling onward, and breaking in brilliant foam. This phenomenon has occupied the attention of many naturalists, some ascribing it solely to animals of the zoophite and mollusca classes, all of which they say possess phosphorus, in a greater or less degree; others, while they admit the existence of luminous sea insects, are of opinion that the light of the sea is more particularly caused by animal and vegetable substances, which in the process of putrefaction discharge their phosphorus. Sir Isaac Newton was inclined to attribute it to friction alone, from the observation that the light is more brilliant when the sea is most agitated; others again, from particular experiments, conceive that it may proceed, at least in part, from a matter contained in the sea-water which has a direct analogy with electricity; finally, it has been supposed that the spawn of fish has a considerable share in this phenomenon. See our article MEDITERRANEAN.

The observations made on the temperature of the sea afford the following general results. 1st.

That the sun's rays rarely penetrate below the depth of forty-five, or according to some of 113 fathoms, below which the sea receives no light, and consequently little or no direct heat from the sun; hence it is inferred that the temperature of the bottom must follow that of the interior of the globe in the different latitudes. 2dly, That the temperature of the sea at the surface differs from that of the atmosphere plus or minus, according to the circumstances of locality, season, weather, time of the day, &c. And 3dly, That the temperature decreases with the depth to a certain degree, but never to freezing, which is prevented by the constant internal heat of the earth.

The following series of observations on the specific gravity and temperature of sea-water, by Dr. Davy, inserted in the Edinburgh Philosophical Journal, were made during a voyage homeward from Ceylon, in 1819 and 1820. They embrace a very large portion of the earth's surface, and, from the accuracy and sagacity of the able chemist by whom they were made, they will be regarded by philosophers as forming a valuable addition to our hydrographical knowledge.

The series of experiments commences at Colombo in Ceylon, on the 4th of December, 1819; and between the 1st of February and the end of June 1820: they were made on board the Eclipse.

Colombo, December 4th, 1819.

| | Temp. Air. | Temp. Water. | Sp. Gr. | Wind. |
|---------|------------|--------------|---------|-------|
| 9h A.M. | 79° | 82° | 1-0228 | N. |
| 5 P.M. | 83 | 83 | 1-0230 | N. |

In both these experiments the water was taken from the shore below the flag-staff.

Colombo, December 11th.

The night was rather squally, with some heavy showers.

Between about N. lat. 3° and S. lat. 7° or 8° a north-west or westerly wind prevails during the same month that the north-east wind prevails in Ceylon. About the limits of the north-east and north-west, and of the south-east and north-west, calms commonly occur. Hence, we may expect that, as those parts of the ocean within the tropics are particularly liable to calms, the temperature of the water will be unusually high; and that in those parts of the ocean within the tropics which are particularly liable to squalls, the temperature of the water will be lower. The north-west or little monsoons blow from Madagascar, and the direction is probably connected with that great island. The north-west is succeeded by the south-west monsoon in the above latitudes.

The night was stormy and rainy, and the wind blowing a gale. During this gale the sky was thickly overcast, so as to be of a dark gray or light sooty hue, but the sea retained its usual color. Its blue color appeared very distinct, when one looked immediately down from the ship into the sea, and it was equally evident in the waves as they rose, their heads being between the light and the eye of the observer. Even in the color of the surface of the sea in general a tint of blue might be distinguished, but it was not bright on account of the darkness of the surface. Hence we may infer that the ocean does not owe its blue color to the reflected azure of the sky, as several authors have supposed.

It was long doubted whether sea-water would freeze, and this doubt was strengthened by the experience of navigators, who found that the ice taken up from the ocean, when thawed, produced perfectly fresh water: hence Buffon supposed it to be formed in rivers, by whose currents it was carried into the ocean. Captain Cook on the contrary ascribed its origin to snow; which, being more solid, and at the same time lighter, bulk for bulk, than the sea-water, would float on the surface and be converted into ice, which must continually augment in thickness from other snow, rain, &c. It is now, however, proved that it requires no very extraordinary degree of cold to freeze water more impregnated with salt than that of the ocean, and that it gets rid of its salt in the process of congelation. Oceanic ices are generally met with in lower latitudes of the southern than of the northern hemisphere; for the northern polar sea being almost surrounded by land, which opposes the free drift of the ices, it is only the pieces formed in the bays of the rivers of America that are carried by the polar current to the south, and such are occasionally met with on the west side of the Atlantic, so low as the latitude of 40°. On the contrary, the Greenland ships who keep along the coast of Europe, where is a constant current from the south, seldom meet with ice till they arrive at the latitude of 76°, and they are usually enabled to advance to the latitude of 80° or even of 82° before their progress is finally stopped by connected field ice. Between Asia and America captain Cook found the continents joined by ice in 70°, and his farthest progress was only 70° 48'.

In the southern seas, there being no obstacle from lands to the drifting of the ices, they are often met with in large masses in latitude 40°. In 60° the ice islands are so numerous as to render navigation extremely perilous, and connected field ice usually entirely arrests it in 70°. In this ocean captain Cook was unable to approach the pole nearer than 71° 10'. This navigator also describes the ice islands of the southern seas as of much greater extent and elevation than those he ever met with in the northern. It is observed that the atmosphere is warmer where ice islands are first met with than in the immediate lower latitude previously passed through, which seems to proceed from the ice reflecting the sun's rays, and also that the temperature is greater near these masses in the re-

gions of their formation than when having drifted into lower latitudes they are thawing, which is evidently caused by the progress of fusion; for, ice being formed by the deprivation of caloric, its fusion can only be produced by a new combination of the same element, which it absorbs from the atmosphere, and renders it extremely cold. The approach to ice islands is denoted, even in the darkest night, by a whitish light which they reflect in the horizon, and which seamen call the blink.

Humboldt has some observations on this subject, which combine, in his own manner, a great deal of scientific and practical information:— 'We must distinguish,' he says, 'with respect to the temperature of the ocean, four different phenomena. 1st, The temperature of the water at the surface corresponding to different latitudes, the ocean being considered at rest, and destitute of shallows and currents. 2dly, The decrease of heat in the superimposed strata of water. 3rdly, The effect of billows on the temperature of the surface water. 4thly, The temperature of currents, which impel with an acquired velocity the waters of our zone across the immoveable waters of another zone. The region of warmest waters no more coincides with the equator, than the region in which the waters reach their maximum of saltness. In passing from one hemisphere to another, we find the warmest waters between 5° 45' of N. lat., and 6° 15' of S. lat. Perrins found their temperature to be 82·3°; Quevedo 83·5°; Churruca 83·7°; and Rodman 83·8°. I have found them in the South Sea to the east of the Galapagos Isles 84·7°. The variations and the mean result do not extend beyond 1·3°. It is very remarkable that, in the parallel of warmest waters, the temperature of the surface of the sea is from 3·6° to 5·4° higher than that of the superincumbent air. Does this difference arise from the motion of the cooled particles towards the bottom, or the absorption of light which is not sufficiently compensated by the free emission of the radiant caloric? As we advance from the equator to the torrid zone, the influence of the seasons on the temperature of the surface of the sea becomes very sensible; but, as a great mass of water follows very slowly the changes in the temperature of the air, the means of the months do not correspond at the same epochs in the ocean and in the air. Besides, the extent of the variations is less in the water than in the atmosphere, because the increase or decrease in the heat of the sea takes place in a medium of variable temperature, so that the minimum and the maximum of the heat which the water reaches are modified by the atmospherical temperature of the months which follow the coldest of the warmest months of the year. It is from an analogous cause that in springs which have a variable temperature, for example near Upsal, the extent of the variations of temperature is only 19·8°, while the same extent in the air from the month of January to August is 39·6°. In the parallel of the Canary Islands Baron Von Buch found the minimum of the temperature of the water to be 68°, and the maximum 74·8°. The temperature of the air in the warmest of the coldest months is, in

that quarter, from 64·4° to 75·2°. In advancing towards the north, we find still greater differences of winter temperature between the surface of the sea and the superincumbent air. The cooled particles of water descend till their temperature reaches 39·2°; and hence in 46° and 50° of latitude, in the part of the Atlantic which is near Europe, the maximum and minimum of heat are

| | |
|--|-----------------|
| In the water at its surface, | 68·0° and 41·9° |
| In the air 'from the mean of warmest and coldest months, | 66·2 and 35·6 |

The excess in the mean temperature of the water over that of the air attains its maximum beyond the polar circle, where the sea does not wholly freeze. The atmosphere is cooled to such a degree in these seas (from 63° to 70° of lat., and 0° of long.) that the mean temperature of several months of winter descend on the continents to 14° and 10·4°, and on the coasts to 23° and 21·2°, while the temperature of the surface of the sea is not below 32° or 30·2°. If it is true that even in those high latitudes the bottom of the sea contains strata of water which, at the maximum of their specific gravity, have 39·2° or 41° of heat, we may suppose that the water at the bottom contributes to diminish the cooling at the surface. These circumstances have a great influence on the mildness of countries in continents separated from the Pole by an extensive sea.

The superior degree of cold of the southern hemisphere than of the northern, in equal latitudes, is now generally ascribed to the greater extension of the southern ices towards the temperate zone. The absence of any considerable land in the high southern seas, and the form of the continents, which terminate in angular points, leave a free course to the polar currents, and permit them, as we have already observed, to convey the ices of the pole far into the temperate zone, where their presence causes those sudden transitions from heat to cold, and those intense fogs, met with by navigators in the great southern ocean. Astronomers have also attributed the superior cold of the southern hemisphere to the sun's being seven days and eighteen hours less in the southern than in the northern signs; but the difference produced by this cause ought not to exceed the one twenty-fifth, while the real difference appears to be one-seventh. The theory of the rays of heat has afforded another explanation in the attempt to demonstrate that in a given time the southern hemisphere loses a greater proportion of its constant proper heat than the northern: but this cause ought not to cease suddenly, between 35° and 40° of lat., as is observed to be the case.

In several places near the shores of the sea springs of *fresh water* are observed, rising to the surface, and refusing to combine with the salt water that surrounds them. The most remarkable instances of these phenomena are in the gulf of Spezia; in the Persian Gulf, near the isles of Bahrein; and in the bay of Xagua, on the south coast of Cuba. It may be presumed that veins of water, finding no outlet towards the surface of

the land, follow the direction of internal fissures even under the sea, until they meet with such an outlet, through which they naturally ascend, with a force in proportion to the elevation of their sources and the declivities of the subterranean canals, in the same manner as spouting springs on the land.

The waters of the ocean cede to very slight impulsions, and are constantly agitated by three different movements; 1. The undulatory movement, or waves; 2. The sidereal movement, or tides; and 3. Currents.

Every movement of the atmosphere, in the form of *winds*, produces a correspondent movement on the surface of the ocean, which increases in rapidity and violence with the velocity and force of the winds: thus a moderate breeze produces a gentle undulation, which, moving slowly onwards, exhausts itself and subsides tranquilly. In a storm the ocean is furrowed by tremendous waves or mountainous ridges of water, each of which rolls on with furious rapidity, until its summit arrives at an overcharging elevation, from which it necessarily precipitates itself by the force of gravity, and, by the acceleration it has acquired in its descent, impels forward the mass of water immediately before it, which in its turn rises, forms a wave, and pushes forward the water before it, and thus is a continual succession of waves generated. Dr. Woolaston found the velocity of the waves to be nearly sixty miles an hour close to the east coast of England. It seems of necessity that their comparative velocity must be greater in the open ocean than near the shores in shoal water, where the mixed particles of sand and mud increasing the density of the fluid, as well as the friction on the bottom, must considerably retard their progress.

Geometricians have attempted to calculate the velocity of the propagation of waves, as being the same as that which a heavy body acquires in descending from a height, equal to half the depth of water in the channel; consequently, if the depth is one foot, the velocity of the wave will be $5\frac{1}{2}$ feet per second of time, and, as the depth is greater or less, the velocity will vary into a ratio underdoubled of the depths, provided they are not too great.—*La Grange Mécanique Analytique*.

To that state of the ocean after a storm, when mountainous and long billows follow each other slowly and subside without breaking, seamen give the name of *swell*, while high breaking waves are called a *sea*. After a storm, if a wind springs up in an opposite direction, the waves it creates being contrary to the swell, what is called a cross sea is produced, often more dangerous than the most mountainous but regular waves. A swell is often experienced in a contrary direction to the wind blowing at the moment, and is a certain prognostic of a change of wind to the direction of the swell, the latter sometimes preceding the former several hours. The extraordinary long swell, always met with near the equator, seems to be caused by the more direct and powerful influence of the sun and moon on this part of the ocean, by which it is necessarily more agitated than nearer the poles, where the action of the heavenly bodies is indirect; besides, the

equatorial region performing its diurnal revolution with greater velocity, and at the same time tracing a larger circle than any other portion of the globe, its waters must be more agitated by the centrifugal force, which, depriving them of a portion of their gravity, renders them more susceptible of external impressions. It is doubtful to what depth the sea is agitated by the winds: twenty fathoms seem to be the farthest to which divers have descended, and at this depth they have found the water so troubled, that mud and shells were carried to considerable distances; while other divers pretend that at the depth of fifteen fathoms they have found the water perfectly tranquil even in the greatest storms. The breaking of the waves on a flat shore is named a *surf*, and is a phenomenon, worthy of particular notice. The surf, says Marsden, (*History of Sumatra*), is at times composed of but one rank of waves along the shore, at other times there are two, three, four, and even more, one behind the other, extending half a mile from the shore. The surf begins to take its form at some distance from the place where it breaks, and augments by degrees as it advances, until it arrives at the common height of fifteen or twenty feet, from the summit of which elevation the wave precipitates itself like a cascade from a precipice, with a noise that may be heard at several miles distance, and which often in the night gives the navigator sufficient notice of his danger to enable him to escape shipwreck on shores where there would be no human possibility of saving his life. Although from the first formation of the surf the water seems to have a rapid progressive motion towards the land, yet a light object floating on it, instead of being carried on shore, drifts parallel to it if the tide is flowing, and drives off if it is ebbing; whence it seems probable that the movement is propagated in the fluid alone as sound is in the air, and that the mass of the wave is not propelled forward, the only real progressive movement being produced by the perpendicular fall at the moment of the breaking of the surf, when the wave, by its descending weight, spreads itself in foam to a greater or less distance, in proportion to its elevation and to the declivity of the shore. Though the wind produces the wave which is to form the surf, it is certain that the wind is not the immediate cause of the surf itself, for it is often greatest in a calm, and least in a storm, and is also often most violent when the wind blows off the shore. Marsden supposes that when the wave approaches a shore whose depth is not in proportion to its volume, this wave, instead of pressing on a mass of water which would elevate itself to an equal height and form another wave, presses on the ground, the reaction of which forces it to precipitate itself as we have described. The greatest surfs are observed between the tropics, and particularly on the coast of Africa, on that of Coromandel, and the west coast of Sumatra.

Tides are periodical oscillations of the sea, caused, as it is said, by the attractions of the sun and moon, and more particularly of the latter; but they involve considerations of sufficient importance to entitle them to a distinct notice. See *TIDES*.

Between the tropics, when uninfluenced by any local circumstances, they flow from the east with the movement of the celestial bodies. In the northern temperate zone they flow from the south, and in the southern temperate zone from the north; that is in both from the equator, where the power of these bodies is most forcibly exerted on the waters. In the northern Frozen Ocean the tides are in general very weak, owing to its distance from the centre of the sidereal attraction, from the lands which surround it, and from the ices with which it is encumbered. Of the tides in the southern Frozen Ocean we have little or no knowledge. The irregularities of the bottom of the ocean, the position of coasts, their declivity under water, the different breadths of channels and straits, winds, currents, and other local and temporary causes, destroy the regularity of tides, and, by varying the degree of friction of the waters, shorten or prolong the duration of the ebb and flood. In most places of the globe the tide flows twice in twenty-four hours, according to the principles of the sidereal attraction; there are, however, a number of exceptions, particularly among the Asiatic islands within the tropics, as well as on the coast of Van Diemen's Land, where there is but one tide of flood in twenty-four hours, and in those places the passage of the moon over the meridian usually makes high water.—Horsburgh. Ind. Direc. Thus among the scattered islands of the tropics the tides are regular, but the rise is inconsiderable; while on the oceanic coasts of Europe, and on the east coast of Asia, they are extremely strong, and subject to many irregularities. The highest tides yet observed are in the Gulf of St. Malo, on the coast of France, where the flood, driven back by the coast of England, accumulates and rises to the height of seven and eight fathoms. It is difficult to give credit to the accounts of the travellers who inform us that, in 1632, the island of Formosa experienced a tide that passed over the chain of mountains that traverses the island!

Among pilots it is customary to reckon the time of *high water* by the point of the compass the moon bears on at that time, allowing three quarters of an hour for each point: thus in places where it is high water at noon, the tide is said to flow north and south, or twelve o'clock; if she bears south-east at high water, it is said to flow south-east and north-west, or nine o'clock; and if she bears south-west it is said to flow south-west and north-east, or three o'clock; and so on for every point of the moon's bearing. But this method of reckoning the time of high water by the compass is liable to great errors. Thus, for instance, it is said, the tide flows east and west, or six hours at Plymouth; but if it was thence understood that the moon is always east or west when it is high water there at full and change very dangerous consequences might result; for, when the moon has a high northern declination, it may happen that she will not bear due east till near eight o'clock in the morning at Plymouth, which will be about two hours after high water, and on the same day she will bear due west soon after four o'clock in the afternoon, or nearly two hours before high water. The best

rule would be to say it is high water so many hours after the moon has passed the meridian.

Currents are movements of the ocean produced by various causes, and may be divided into general and particular; the former, depending on fixed and general causes, always preserve the same direction and limits; while the latter, resulting from local and temporary ones, vary in both. Between the latitudes of 30° , in both hemispheres, a constant movement of the ocean is observed, which seems to convey its waters from east to west, or in a contrary direction to the rotation of the globe: by another movement the waters of the polar seas are conveyed towards the equator. The causes of these two general and constant currents are the heat of the sun and the rotation of the globe. See our article *CURRENT*.

The existence of contrary superior and inferior currents, supposed by Halley and denied by Buffon, is still doubtful. Those who admit these opposite currents assign as the possible causes the different densities of the waters at different depths, a great rapidity of movement towards the surface, and the cohesion of the molecules of fluids. In the Strait of Gibraltar, the Sound, and the channel of Constantinople, these contrary currents are asserted to exist. See *GIBRALTAR*.

When two opposite currents of equal force meet they form a spiral vortex, or *whirlpool*, of which the most celebrated are the Maelström, on the coast of Norway, and Euripus, in the Strait of Negropont. Charybdis, in the Strait of Messina, has also been described, both by the ancients and moderns, as a whirlpool, though it seems to be only a violent agitation of the waters at the surface by the meeting of the tides, and has no vortex. It was the phenomena of whirlpools that gave rise to the now exploded idea of abysses, which penetrating through vast masses of land formed subterranean communications between distant seas; such as between the sea of Norway and the Gulf of Bothnia by the Maelström, between the Persian Gulf and Caspian Sea, &c.

If we set out from 63° of N. lat., on the east side of the old continent, and follow its coasts to beyond the equator, we find them presenting a series of vast basins and gulfs penetrating into the continent, and enclosed within chains of islands and banks, separated by narrow and winding channels. On the western side of the same continent we observe nothing similar. From the north cape of Lapland to the Cape of Good Hope the coast presents a continuity unbroken, except by the mouths of rivers, and by the entrances of the Baltic and Mediterranean seas; the formation of which are accounted for on different principles; and with respect to the British islands, which form a mere point in this space, their separation from the continent was probably produced by a sudden convulsion of the earth, rather than by the gradual action of the waters.

In following the eastern coasts of the new continent, from the latitude of 60° N. to within 10° of the equator, ruptures of the land and chains of islands and banks are presented to us similar to those we have observed on the east coasts of our own continent: thus Davis's Strait

and Hudson's Bay answer to the Sea of Tartary, the Gulf of St. Lawrence to the Sea of Japan, while the West India islands enclose the Gulf of Mexico and Caribbean Sea, as the Lieue-Kieu islands and the Malay Archipelago do the seas of Corea, of China, and of Sunda. No such appearances are observed on the western coast of America, which, with the exception of the gulf of California, from Cape Horn to Cape Prince of Wales, presents a rampart of abrupt cliffs, immediately washed by the Grand Ocean.

This broken state of the eastern coasts of the continents is ascribed by Buffon and other writers to the constant movement of the ocean from east to west; and this opinion is strengthened by the observation, that the coast of Asia is more broken than that of America, and that it ought to be so from the difference in the masses of waters of the two oceans, the Grand Ocean being at least three times broader than the Atlantic, consequently allowing them the same lengths, and supposing their depths in proportion to their different breadths, the former has nine times the solid contents of the latter, and therefore must, their velocities being equal, act with nine times the power on the body of land that opposes it. Moreover the greatest effect ought to be produced, near the equator, because it is there that the masses of the waters and the velocity of their constant movements are greatest; and accordingly it is between the tropics that the eastern coasts of both continents are most torn, and the greatest effect is manifested precisely where the breadth of the ocean is greatest, that is, in the Atlantic, between the parallels of 7° and 29° N. and in the Grand Ocean, on the entire space between the tropics; for it is at the equator itself that this ocean has the greatest breadth. The only difficulty in adopting the opinion of Buffon is, that the lapse of several centuries has scarcely rendered sensible the action of the sea on these coasts; but to this objection it may be replied that, the sea having washed away the lighter or less cohesive matter that primitively united the now detached lands to the continents, there remain only substances of so hard a nature that the efforts of the ocean against them are almost powerless. It is also to be observed, in support of this hypothesis, that the coast of South America within the tropic, which is exposed to the continual action of the equatorial winds and currents, is lined by a chain of rocky banks which protect it from their violence, while the opposite coast of Africa is bordered by a beach of fine sand.

But, though the changes produced by the sea on the coasts since the period of history are insignificant in a great general point of view, they are nevertheless sufficient to demand particular notice. The sea forms new lands by the sand, shells, marine plants, and mud of rivers which it deposits on the margins of the shores, and also by retiring from some parts, in consequence of having encroached on others. The coasts of the Mediterranean have both gained and lost, so that it is probable the one compensates the other. The port of Alexandria, on the coast of Egypt, grows every day shoaler; and Damietta, the walls of which were washed by the sea in the

thirteenth century, is at present considerably inland. These alterations, however, seem to be produced rather by the sand blown from the desert, than by matters thrown up by the sea; and to compensate them Lake Menzaleh appears to have been formed, either by an irruption of the sea, or by a branch of the Nile, whose channel has been neglected. Some of the ancients supposed that a great gulf once penetrated into Egypt as far as Thebes, by which the isle of Pharos was separated a day's navigation from the Terra Firma; but the existence of this gulf is unsupported by any historical or natural proof, and, with the few trifling alterations we have noticed, the coast of Egypt at this day answers to the earliest description by Herodotus.

On the coast of Syria the island of Tyre has been united to the continent, and on the west coast of Asia Minor the inhabitants of Miletus and Ephesus have several times been obliged to change the sites of their towns to follow the sea which receded from them. The valley through which the Meander now serpentine was evidently once a gulf, its soil consisting of the depositions of the sea and river. On the west coast of Greece many islets have been joined to the main, while the celebrated peninsula of Leucadia has become an island. In the Adriatic the sea has encroached on the coasts of Dalmatia and Istria, and retired from those of Italy, so that the greater part of ancient Lombardy has been formed by the combined depositions of the sea and the Po. Ravenna, which formerly had an excellent port, and was surrounded by lakes and salt marshes, is now three miles from the sea, in the midst of gardens and meadows; Aquileia was also formerly on the margin of the sea, and finally the lagoons of Venice are daily filling up.

From the Mediterranean coasts of France and Spain the sea has retired in several places and gained on none; thus much new land has been formed at the mouths of the Rhone; and Aigues Mortes, which in the thirteenth century was a sea-port, is now five miles inland. Miquelon and Psalmodi were islands in 815, though now two leagues from the sea, and the vineyards of Agde were covered by the sea only a century past. The coasts of Valencia and Catalonia have also considerably gained from the sea, and the port of Barcelona is fast filling up. From this series of facts it would appear that the coasts of the Mediterranean have gained more than they have lost; but it must be considered that, with the exception of Egypt, we are unacquainted with the relative ancient and modern state of the coast of Africa: and besides a number of celebrated ports preserve the same depths as in the time of the ancients, such as Marseilles, Genoa, Syracuse, Navarin, &c.; hence there seems to be no sufficient reason to suppose a diminution of the waters of the Mediterranean.

The waters of the Atlantic by their depositions have formed the bases of the landes, or sandy downs that border the coast of France from Bayonne to Bordeaux, and by which several ancient bays have been filled up. The marshes of la Vendée have also been left by the sea. In the English Channel the bay on the coast of France, in which is Mount St. Michael, grow

shoaler, while near Dol the sea is again encroaching on the lands from which it had formerly retired. The sea has encroached on some of the coasts of England and retreated from others; thus the Goodwin Sands are generally thought to have been formed by an irruption of the sea in 1100, while in later times several of the best harbours between the Thames and Beachy-head have been filled up. On the coast of Lincoln the sea seems to have alternately formed new lands and submerged them.

On the coast of Holland the most remarkable alterations and vicissitudes have been produced by the sea. In the earliest history of this country it is described as composed of immense marshes, alternately inundated by the sea and rivers; the first threw up sand on the shores, and the latter deposited mud on their banks, and thus elevated spots were formed, round which human industry raised embankments, thought capable of resisting the utmost fury of the ocean. The country, however, still remained intersected by lakes and rivers, which silently undermined these new formed lands, and the sea in high tides rushing up the rivers produced terrible inundations. Before 1250 the Zuyder Zee was a lake of middling size, which communicated with the British Sea by the river Vlie; in that year an irruption of the sea gave it its present form and extent. Until 1300 the gulf of the Dollart was a rich plain; and, in 1421, a united inundation of the sea and rivers formed the Biesboch, by submerging seventy-two villages with 100,000 souls.

The coasts of Holstein and Sleswick have alternately lost and gained by the action of the sea. In 1240 the territory of North Friesland had an extent of fifteen leagues east and west, and consisted of rich pastures and corn lands. An irruption of the sea destroyed this smiling appearance, swallowing up a considerable portion of the territory, and, detaching the rest from the continent, formed the island of Nordstrand, which at the commencement of the fifteenth century had still an extent of six to eight leagues, and was celebrated for its fertility and population. The sea still continuing to encroach on it, dikes were thrown up to arrest its progress, and the inhabitants, to the number of 8000, thought themselves in perfect safety. In 1643, however, the sea penetrated by more than forty breaches in the dikes, swept away 1000 habitations and 6000 persons, and of the island left but two fragments above water and several submerged banks; even these small remains have been attacked by the merciless element, the dikes being considerably damaged in 1791 and 1793. On the other hand, the sea deposits on the shores of the mainland of these provinces a fat mud, which forms new lands, that by their great fertility in a few years repay the considerable expense of embanking them. All the west and north coasts of Jutland appear to owe their formation to the sea, which by throwing up sand has made a connected coast of what was formerly probably a chain of islands. It is at least certain, that several gulfs, which, according to the annals of the north, afforded retreats to the Scandinavian pirates, have been thus filled up. The alterations

produced by the action of the waters on the coasts of the Baltic since the memory of history seem to compensate each other, and to be principally produced by currents.

On the eastern shores of the old continent we know that the sea retires from the east shore of the bay of Bengal and encroaches on the west, where it has washed away almost the whole of the ancient city of Mahabilipur, some of the ruins of which, called by the English the seven pagodas, are still to be seen between Madras and Sadras. The sea has also encroached on the Malabar coast, where a part of the old city of Calicut is now under water. The whole coasts of the Red Sea, according to Niehbur, indicate the retreat of the waters. On a great part of the coasts of Cochin-China and Tonquin are observed proofs of the recent retreat of the sea, while on some parts it has encroached, and obliged the inhabitants to remove their villages inland.

The changes operated on the coasts of the new continent are little known to us; the new lands formed at the mouths of the Mississippi and Oronoka owe their origin to the alluvion of these rivers. On the western coast the sea is said to gain on the land, and captain Vancouver observed appearances which indicated a considerable encroachment on the north-west coast.

We are now brought to the consideration of a question which has long divided the most celebrated naturalists:—“Are the waters of the ocean diminishing?” Celsius, a learned Swede, towards the middle of the last century, revived the opinion held by some of the ancients, respecting the gradual desiccation of the ocean, and published a memoir in which he supported the diminution of the waters from the first existence of our continents, and the continuance of that diminution, which, from observations made on the coasts of the Baltic, he estimated at fifty-four inches in every 100 years. This hypothesis was favored by many learned naturalists of the north, among whom Linnaeus stood foremost, and on it founded a theory of the earth; but it at the same time met with great opposition, and even the states of Sweden took a part in the dispute, the clergy anathematising it as contrary to holy writ, and the citizens uniting with them, while the nobles and peasants more wisely remained neutral.

The arguments in favor of the diminution are founded on the shells and other remains of sea animals met with on the highest mountains, the filling up of ancient ports and straits, and the anchors and remains of vessels found far from the sea, and at considerable heights above its present level.

The opposers reply that the two first of these facts ought to be referred to two very different periods; for that the remains of sea animals belong to an age anterior to the formation of the present continents, and consequently prior to the existence of the present ocean, while the changes produced by the sea on the coasts have generally been effected since the memory of history. With respect to the anchors and vessels they explain the fact by supposing them to be the monuments of inland navigations on lakes and rivers which no longer exist, or of the universal deluge, pre-

vious to which there existed other continents inhabited by men, and which disappeared in the grand catastrophe that brought our present continents out of the waters; hence, say they, it is presumable that the antediluvians navigated over our present lands, and threw out their anchors on our mountains, which were then shoals covered by the ocean. It is further observed by the opposer of the diminution, that the experience of twenty centuries, handed down to us by historical record, proves that the ocean with respect to its total volume is perfectly stationary, the diminution by evaporation being exactly compensated by the supplies it receives from rains, rivers, &c. To this it may be replied, that the loss of the sea by evaporation, being compensated only by these supplies, whatever tends to decrease them must necessarily produce an absolute diminution of the ocean; but, as the mountains decrease in height by the action of the elements, the vapors they arrest, and the condensation of which produces rains and rivers, must also be diminished. But what then, it may be asked, becomes of the water thus withdrawn from the ocean? Is it absorbed by volcanoes or by vegetables, or does it rise in vapors to other spheres? These are questions which it is not given to science to resolve, nor are they the only insolvable ones on the subject of the immense ocean, the probable cradle of the universe, and of which it may possibly be also the grave.

A variety of *plants* are nourished by the ocean to which are given the general denomination of *fuoi*, and which are vulgarly known by the names of sea and rock weeds. Some species adhere to the rocks close to the bottom, while others rise from these rocks to the surface, over which they spread for considerable spaces; such is the *fucus giganteus* observed by captain Cook in the Great Southern Ocean, near Terra del Fuego and Kerguelen's Land, which rising from a rocky bottom, twenty-four fathoms deep, spreads over the sea in such a manner that its whole length is estimated at sixty fathoms, though the thickness is not greater than that of a man's thumb. In the North Atlantic is a space extending between the latitudes of 20° and 40°, and between the longitudes of 25° and 40° W., which is at all seasons covered with a species of weed (*fucus natans*) of a beautiful green color, whence the early Dutch navigators gave to this space of the ocean the name of Kroos Zee, Sea of Duckweed, and the Portuguese that of Mer de Sargazo. It was formerly generally believed that this weed was torn from the Florida Reefs, and conveyed by the gulf stream to where it is met with, and hence it received the name of gulf weed: an accurate examination has however shown this idea to be unfounded, and leads to the inference that it propagates in the sea, and vegetates floating. Navigators have been led from isolated facts to consider the meeting patches of rock-weed at sea as a sign of the vicinity of land; this however is by no means a certain indication, such weeds being frequently met with at some hundreds of leagues from any land, and out of soundings.

It seems probable that the different regions of the ocean have their peculiar animals confined to

them by the temperature of the waters and their own species of food. To commence with the lowest class, or zoophytes, they are in great measure so little known, and so difficult to class, that we cannot say if each region exclusively possesses such or such a species. The varieties of corals, called madrepores, millepores, tubepores, &c., seem to exist in a state of vitality only in the tropical regions, and there we find them forming what may be justly named coral seas; such are the South Pacific Ocean, the region between the coast of Malabar and the island of Madagascar and the West Indian seas. The various species of mollusca also appear to be confined to their respective regions, those of the torrid zone not being met with beyond the lowest limits of the temperate. The abysses of the ocean contain monsters of this class, of which we have still but a very imperfect knowledge. Polypuses and hydras, several yards long, have been observed in the English Channel and in the strait of Messina; nor is it unlikely that the famous sea snake of the Norwegian seas is an immense animal of the same class. There is also reason to suppose that the depths of the sea are inhabited by testaceous molluscs, which are never seen on the shores; such appear to be the cornes d'ammon and other species found in a petrified state in the bowels of the earth, and of which none have been hitherto met with on the shores, or fished up from the bottom of the sea.

The want of industry in fishes renders it probable also that each region has its peculiar species, which never quit it: thus the various species of the cod (*gadus*), the herring, and the mackerel, are only found in the northern seas; while the dolphins, albacores, bonetas, &c., are confined to the tropics, or a little beyond them, where they wage an unmerciful war against the flying fish, which is also confined to the torrid region. Cetaceous and oceanic amphibious animals being under the necessity of frequently respiring the atmospheric air, it is probable that their various species are confined to certain climates; thus the black whale of the Northern Frozen Ocean seldom appears in the temperate zone; while the spermaceti whale, which affords ambergris, is scarcely ever seen out of the tropical seas. The seals of the southern seas also differ from those of the north; and the great sea lion of Kamtschatka from that of Greenland.

Each grand maritime division of the globe has also its particular species of *birds*; the albatross and several of the petrel tribe, the penguin, &c., are only met with in the temperate or frozen zones, while the man of war and tropic bird never quit the equatorial regions.

A few words as to the *dominion* of the ocean may be excused from us as Englishmen.

England has long claimed the empire of the Channel, and even of all the three seas, encompassing the British isles. It is in consequence of this claim that children born in these seas are declared natural Englishmen, as much as if born on English ground. The justice of this pretension is strenuously argued between Grotius and Selden.

The open sea in its own nature cannot be exclusively possessed, as no one is able to settle

there so as to hinder others from passing. But a nation powerful at sea may forbid others to navigate it and to fish in it, declaring that it appropriates its dominions to itself, and that it will destroy the vessels that shall dare to appear in it without its permission. Vattel investigates its right to do this. It is evident, in the first place, that nobody has a right to appropriate to himself the use of the open sea; for he who navigates or fishes in it does no injury to any one, and the sea, in both these respects, is sufficient for all mankind. Nor does Nature give to any man a right of appropriating to himself things that may be innocently used, and that are inexhaustible, and sufficient for all; since, every one being able to find in their state of communion what was sufficient to supply their wants, to undertake to render themselves sole masters of them, and to exclude all others, would be to deprive them, without reason, of the benefits of nature. Although the law of nature approves the rights of dominion and property, which put an end to the primitive manner of living in common, this reason could not take place with regard to things in themselves inexhaustible, which cannot therefore be justly appropriated. If the free and common use of a thing of this nature were prejudicial or dangerous to a nation, the care of its own safety would authorise it to subject, if possible, that thing to its dominion, in order to permit the use of it with such precautions as prudence should direct. But this is not the case with the open sea, in which people may sail and fish without the least prejudice to any person, and without putting any other people in danger. No nation then has a right to lay claim to the open sea, or to appropriate the use of it to itself to the exclusion of others.

The kings of Portugal have formerly arrogated to themselves the empire of the seas of Guinea and the East Indies; but the other maritime powers gave themselves little trouble about such a pretension. The right of navigating and fishing in the open sea being then a right common to all men, the nation which attempts to exclude another from that advantage does it an injury, and gives a sufficient cause for war: nature authorising a nation to repel an injury; that is, to make use of force against any one who would deprive it of its rights. Besides, a nation which, without a title, would arrogate to itself an exclusive right to the sea, and support it by force, does an injury to all nations whose common right it violates; and all are at liberty to unite against it, in order to repress such an attempt.

However, observe these casuists, each has the *liberty of renouncing its rights*, and a nation may acquire exclusive rights of navigation and fishing by treaties, in which other nations renounced in its favor the right they derive from nature. These are obliged to observe their treaties, and the nation they have favored has a right to maintain by force the possession of its advantages. Thus the house of Austria has renounced, in favor of England and Holland, the right of sending vessels from the Netherlands to the East Indies. Many examples of like treaties may be found in Grotius, *De Jure Belli et Pacis*, lib. ii. cap. 3.

OCEANIDES, or OCEANITIDES, in mythology, sea nymphs, daughters of Oceanus and

VOL. XVI.

the goddess Tethys. They were 3000 according to Apollodorus, who mentions the names of seven of them: Asia, Styx, Electra, Doris, Eurynome, Amphitrite, and Metis. Hesiod speaks of the eldest of them, of whom he reckons forty-one. Hyginus mentions sixteen, whose names are almost all different from those of Apollodorus and Hesiod. The Oceanides, like the rest of the inferior deities, were honored with libations and sacrifices. Prayers were offered to them, and they were intreated to protect sailors from storms and dangerous tempests. The Argonauts, before they proceeded to their expedition, made an offering of flour, honey, and oil, on the sea shore, to all the deities of the sea; sacrificed bulls to them, and intreated their protection. When the sacrifice was made on the sea shore, the blood of the victim was received in a vessel; but, when it was in open sea, they permitted the blood to run down into the waters. When the sea was calm they generally afforded a lamb or a young pig; but if it was agitated by the winds, and rough, a black bull was deemed the most acceptable victim.

OCEANUS, in pagan mythology, the son of Cœlus and Terra, the husband of Tethys, and the father of the Oceanides. The ancients called him the Father of all things, imagining that he was produced by Humidity, which, according to Thales, was the first principle from which every thing was produced. Homer represents Juno visiting him at the remotest limits of the earth, and acknowledging him and Tethys as the parents of the gods. He was represented with a bull's head, as an emblem of the rage and bellowing of the ocean when agitated by a storm. According to Homer, he was the father of all the gods, and on that account he received frequent visits from them. He is often, indeed almost always, represented as an old man with a long flowing beard, sitting upon the waves of the sea. He often holds a pike in his hand, while ships under sail appear at a distance, or a sea monster stands near him. Oceanus presided over every part of the sea, and even the rivers were subjected to his power. The ancients were superstitious in their worship of him, and revered with great solemnity a deity to whose care they entrusted themselves when going on any voyage.

OCELLATED, *adj.* Lat. *ocellatus*. Resembling the eye.

The white butterfly lays its offspring on cabbage leaves; a very beautiful reddish ocellated one.

Derham's Physico-Theology.

OCELLUS LUCANUS, or the LUCANIAN, an ancient Pythagorean philosopher, who lived before Plato. His work *Περὶ τοῦ Παντός*, or the Universe, is the only piece of his which is come down entire to us; and was written originally in the Doric dialect, but was translated by another person into the Attic; William Christian, and after him Louis Nogarola, translated this work into Latin; and there are several editions of it both in Greek and Latin. A fragment is also extant of his work on Laws, which is praised by Plato.

OCHINUS (Bernardin), a celebrated Italian born at Seine in 1487, and at first a Cordelier. He afterwards attended to the study of physic,

and acquired the esteem of cardinal Julius de Medicis, afterwards pope Clement VII. But once more changing his mind he resumed his monk's habit, and, aiming at still higher perfection, he, in 1534, joined the reformed sect of the Capuchins. He practised with the most rigorous exactness all the rules of the order; which he contributed so much to improve, that some have called him the founder of it. He was made vicar-general, and became highly eminent for his pulpit eloquence. Pope Paul III., on account of his extraordinary merit, made him his father confessor and preacher. He was thus the favorite both of pope and people; when falling in with one John Valde, a Spaniard, who had imbibed Luther's doctrine, he became a proselyte. He was then at Naples, and began to preach in favor of Protestantism; on which he was summoned to appear at Rome; and in his way thither met at Florence with Peter Martyr, who persuaded him not to put himself into the pope's power: and they both agreed to withdraw to some place of safety. Ochinus went first to Ferrara, where he disguised himself as a soldier; and, proceeding thence to Geneva, arrived there in 1542, and married a woman of Lucca. He then went to Augsburg, where he published some sermons. In 1547 he was invited, together with Peter Martyr, into England, by archbishop Cranmer, to assist in carrying on the Reformation. They arrived in December at Lambeth, were kindly received by Cranmer, and were made prebendaries of Canterbury. Ochinus labored heartily in the Reformation; and his dialogue upon the usurped primacy of the bishop of Rome was translated into Latin by Ponet bishop of Winchester, and published in 1549. But upon the death of Edward VI. being forced to leave England, they both retired to Strasburg in 1553. From this city Ochinus went to Basil, and was invited thence in 1555 to Zurich, to be minister of an Italian church, which consisted of some refugees from Locarno. Ochinus subscribed the articles of faith agreed upon by the church of Zurich, and met in that city with Bullinger, who proved a very good friend to him. He governed this Italian church till 1563, when he was banished thence by the magistrates for publishing some dialogues, wherein he defended polygamy. From Zurich he went to Basil; but, not being suffered to stay there, he fled in great distress into Moravia, where he fell in with the Socinians, and joined them. Stanislaus Lubieniski, the great patron of this sect, gives the following account of his last days in his Hist. Reformat. Polon. 'Ochinus,' says he, 'retired into Moravia and Poland, and even there he was not out of the reach of Calvin's letters.' He returned into Moravia after king Sigismund's edict; who, in 1564, banished all Tritheists, Atheists, &c. During his travels, he fell sick of the plague at Pincknow, and received there all possible kindness from one of the brethren, named Phillippovius. His daughter and two sons, who were with him, died of the plague; but he had buried his wife before he left Zurich. He continued his journey to Moravia, and within three weeks died at Slakow in 1564, aged seventy-seven. His writings are numerous.

OCHINA, in botany, a genus of the monogynia order and polyandria class of plants: cor. pentapetalous: cal. pentaphyllous: berries monospermous, and affixed to a large roundish receptacle. Species two, both natives of the East Indies.

OCHIRE, *n. s.* } Fr. *ocre*, *ochre*; Lat. *ochra*;
O'CHROUS, *adj.* } Gr. *ωχρα*. A coarse kind of
O'CHREY. } earth: ochreous and ochrey
 mean consisting of or partaking of ochre.

This is conveyed about by the water; as we find in earthy, *ochrey*, and other loose matter.

Woodward.

In the interstices of the flakes is a grey, chalky, or ochreous matter. *Id. on Fossils.*

The earths distinguished by the name of *ochres* are those which have rough or naturally dusty surfaces, are but slightly coherent in their texture, and are composed of fine and soft argillaceous particles, and are readily diffusible in water. They are of various colours; such as red, yellow, blue, green, black. The yellow sort are called *ochres* of iron, and the blue *ochres* of copper. *Hill.*

This family is commonly accompanied by native copper, malachite, and brown iron ochre. *Kirwan.*

OCHRE, in mineralogy and the arts, a yellow earthy powder, generally consisting of some sub-salt, or oxide of iron, united with argil or lime. The iron is generally derived from the decomposition of supersulphuret of iron, which is first converted by exposure to the atmosphere and to moisture into sulphuret of iron and then into suboxysulphate. This latter salt, being insoluble, forms a yellow deposit, which penetrates the earth, and constitutes the most common kind of ochre.

Artificial ochres may be prepared of equal, and perhaps of superior quality to those of nature. The sulphate of iron in the manufacture of this article becomes oxysulphate by long exposure to the air. It remains in this situation till it gradually resolves itself into the super-oxysulphate and the sub oxysulphate. The latter falls to the bottom of the vessel in the form of a yellow powder, which, when washed and dried, constitutes a beautiful color. If carbonate of potash is added to the super-oxysulphate, the carbonate of iron will be formed, which will precipitate in the state of a yellow powder. This powder, when washed, and the water evaporated, constitutes an ochre which is a little deeper in color than the last. The heat of boiling water drives off the carbonic acid, leaving the oxide of a fine brown color.

OCHRE, RED, in mineralogy, is arranged by Cleveland as a species of earthy oxide of iron. Its color is described as blood red, sometimes brownish red. It is usually friable, and easily reduced to powder. Fracture dull and earthy. Strongly soiling the fingers, but not unctuous. Specific gravity about 3.00. Seldom in large masses, usually appearing on the surface of ores of iron, or disseminated. It never effervesces with acids, and is often a very pure oxide. By mixture with argillaceous earths, it gradually passes into reddle, bole, &c. It is often found with specular and sparry iron; but in its purest state seldom occurs in large quantities.

When purified by agitation in water it con-

stitutes an important paint for many purposes. It may be made to assume various tints of red, by changing its state of oxidation by the action of a mild heat. To this variety belongs the pigment, called Indian red, brought from the Isle of Ormus, in the Persian Gulf.

OCHRIDA, a town of Greece, in Albania, situated north-east of the lake of Ochrida, and on the declivity of Mount Maniana Petrin. In the neighbourhood are mines of silver and sulphur which principally employ the inhabitants, who amount to about 6000. It is 100 miles north of Joanniva.

OCHROMA, in botany, a genus of the pentandria order, and monadelphia class of plants; natural order thirty-seventh, columnifera: cor. consists of six petals, three external and three internal; antheræ unite, and form a spiral pillar round the style: caps. long, and has five loculements, which contain a number of black round seeds. Of this there is only one species, viz.—

O. lagopus, the down tree or cork wood. This tree is frequent in Jamaica, is of speedy growth, and rises to about twenty-five or thirty feet. The flowers are large and yellow. The capsules are about five inches long, rounded, and covered with a thin skin; which when dry falls off in five longitudinal segments, and leaves the fruit greatly resembling a hare's foot. The down is short, soft, and silky: it is used sometimes to stuff beds and pillows: but, like other vegetable downs, is apt to get into clots. An insipid clear gum exudes from the tree when wounded. The bark is tough, and its fibres are in a reticulated form: it might be made into ropes. The dried wood is so very light and buoyant as to be used by the fishermen in Jamaica for their nets instead of pieces of cork.

OUCHUS ARTAXERXES, a king of Persia, cruel and avaricious; who, to strengthen himself on his throne, murdered all his brothers and sisters. His subjects revolted; but he reduced them, and added Egypt to his dominions. Bagoas, his favorite eunuch, poisoned him for the insults he had offered to Apis the god of the Egyptians; gave his flesh to be eaten by cats, and made handles for knives with his bones.

OCKER, a river of Lower Saxony, which rises in the Hartz Mountains, eight miles south-east of Goslar, passes Wolfenbuttle, Brunswick, and Aller.

OCKHAM, **OCCAM**, or **OCCHAM** (William), a celebrated scholastic divine in the fourteenth century, of the order of Cordeliers. He was a native of England, and disciple to the famous Duns Scotus. He was head of the Nominalists; and acquired so much celebrity as to be denominated the invincible doctor. At the request of Michael de Cesena, general of his order, he became a party man with Lewis of Raviera, who was an avowed enemy of the church of Rome; and he wrote vigorously against pope John XXII. and his successors. Trithemius informs us that he used to say to Lewis, 'My lord, let your sword defend me, and my pen shall be always ready to support you.' He treated Charles and Clement in a book he wrote against them with gross scurrility. The consequence was an accusation against him and Cesena. They were

charged with maintaining that neither Christ nor his apostles had any possessions at all. This doctrine gave rise to that pleasant question, called the bread of the Cordeliers; whether the dominion of things consumed in the use, such as bread and wine, belonged to them, or only the simple use of them, without the dominion? Their rule not permitting them to have any thing as property, pope Nicholas III., who had been of their order, devised a method to enrich them without breaking their rule. He made an ordinance that they should have only the usufruct of the estates, and that the soil and fund of all such donations should belong to the Roman church. But on this account, pope Nicholas's bull was revoked by John XXII. who condemned the use without the dominion, by his *Extravaganta ad Conditorem*. He also condemned, by another *Extravaganta cum inter*, the doctrine about the possession of estates by Christ and his apostles. Ockham and Cesena were also excommunicated, because they had departed from Avignon without the pope's licence, and had written against him. Ockham, however, was absolved before he died, which was about 1347. Several pieces of his, written with considerable wit and subtlety, are extant. The reformed church sometimes makes use of his reasonings against the church of Rome. Melchior Goldast printed, in his *Treatise on Monarchy*, 413 questions of Ockham. His works are mentioned by many authors.

OCKLEY (Simon), a learned orientalist, born at Exeter in 1678, and educated at Queen's College, Cambridge, where he distinguished himself by his intense application to literature. At the usual time he took his degrees of A. M. and B. D., but, marrying very young, was precluded from a fellowship in his college. In 1705 he was presented to the vicarage of Swavesey in Cambridgeshire; and in 1711 he was chosen Arabic professor of the university. He was perfect master of the Arabic and other oriental tongues; the learned Reland said of him, *Vir, si quis alius, harum literarum peritus*. Afterwards he had the misfortune to be confined in Cambridge castle for debt. The above preferments, notwithstanding, he enjoyed till his death, August 9th, 1720. He wrote, 1. *Introductio ad Linguas Orientales*; 2. *The history of the present Jews throughout the world*; translated from the Italian of Leo Modena, a Venetian rabbi; 3. *The Improvements of Human Reason*, exhibited in the Life of Hai Ebn Yokdhan, translated from the Arabic; 4. *The history of the Saracens*, collected from the most authentic Arabic authors, in 2 vols, 8vo. He was also well skilled in the French, Spanish, and Italian languages.

OCNUS, in fabulous history, the son of the prophetess Manto, by the river Tiber, or rather by Tiberinus king of Alba. He assisted Æneas against Turnus, and afterwards built Mantua. *Virg. Æn. x. 198.*

OCRISIA, in fabulous Roman history, the wife of Corniculus, one of the attendants of Tanaquil, the wife of Tarquinius I. As she was throwing into the flames for offerings some of the meats that were served on the table of Tar-

quin, she suddenly saw in the fire what Ovid calls *obsœni forma virilis*. She informed the queen of it; and when by her command she had approached near it, she conceived a son who was named Servius Tullius, and was educated in the king's family. . He afterwards succeeded to the vacant throne. It was reported that Vulcan had assumed the form which Ocrisia saw, and was the father of the sixth king of Rome.

OCTAETERIS, a cycle or term of eight years, in the Grecian chronology, at the conclusion of which three entire lunar months were added. This cycle was in use till Meton's invention of the golden number or cycle of nineteen years.

OCTAGON, *n. s.* } Greek *οκτω* eight and
OCTAGONAL, *adj.* } *γωνια*, an angle. An
OCTANGOULAR, } eight-angled figure; hav-
OCTAHEDRAL. } ing eight angles: octahe-
 dral is, having eight sides.

A figure consisting of eight sides and angles, when all the sides and angles are equal, is called a regular *octagon*, which may be inscribed in a circle.

Harris.

OCTANDRIA, *οκτω* eight, and *ανδρ*, a man, the eighth class in Linneus's sexual system; consisting of plants with hermaphrodite flowers, which are furnished with eight stamina, or male organs of generation. See **BOTANY**.

OCTANT, *adj.* } In astrology, is applied
OCTILE. } to the aspect of a planet distant only one-eighth of a circle, or 45° from another.

OCTAPLA, in sacred literature, denotes a polyglot bible, consisting of eight columns, and as many different versions of the sacred text; viz. the original Hebrew both in Hebrew and Greek characters, Greek versions, &c.

OCTAVE, *n. s.* Fr. *octave*; Lat. *octavus*. The eighth day after some particular festival; eight days after such a festival taken collectively: in music, an interval of eight sounds.

But in this organ the hautboy stop seems to be an octave higher

Addison.

OCTAVIA, a Roman lady, distinguished for her virtues, her beauty, and her accomplishments, the sister of Augustus, and the wife of Marc Antony. She was first married to Claudius Marcellus, by whom she had three children; and after his death, which happened a short time after the war with Persia, became the wife of Antony. She was at this time universally respected and esteemed, and much beloved by her brother; and, although her husband had before been captivated by the allurements of Cleopatra, the merits of Octavia made a great impression on him. . He passed two years and a half with her, during which time she bore him two daughters. She soon after accompanied him into Greece, and restored concord between her husband and brother. She then returned to Rome, while Antony went into the east; and then it was, says Plutarch, that the worst of all diseases, love, and the love of Cleopatra, which had lain so long dormant in his breast, and seemed to have given place to the temperate duties of life, upon his approach to Syria, gathered strength, and broke out into a flame: he had another interview with her, which rivetted

his fetters, and sealed his fate. Octavia was soon apprised of his infidelity, but resolved for that reason to omit no duty that became her situation as his wife: she collected considerable supplies for the war in which he was engaged, and sailed with them to Athens. Here she received the mortifying and distressing orders to advance no farther. Despairing now of a renewal of his affection, she returned to Rome, where Augustus, extremely enraged, wished to persuade her to retire from the world. But she refused to quit her husband's house, and devoted herself to the education of her children, bestowing no less care on those of Antony by Fulvia, his first wife, than she did upon her own. She readily and liberally entertained all her husband's friends who were sent to Rome on business, and used her best endeavours to promote his interest. His attachment, however, to Cleopatra rendered him insensible to her kindness; he solemnly divorced her and married Cleopatra. This affront was highly resented by Augustus, who resolved to revenge her cause by arms, which he ultimately did. See **ANTONIUS**. Marcellus, her son by her first husband, was married to a niece of Augustus, and was publicly intended as a successor to his uncle; but his sudden death plunged all his family into the greatest grief. Virgil, upon this occasion, paid, in his *Æneid*, a melancholy tribute to the memory of a young man whom Rome regarded as her future father. He was desired to recite his composition in the presence of Augustus and of his sister, but Octavia, when he repeated *Tu Marcellus eris*, swooned away. This pathetic encomium upon the virtues of young Marcellus was liberally rewarded by Octavia, and Virgil received 10,000 sesterces for every one of the verses. Octavia had two daughters by Antony, Antonia Major and Antonia Minor. The death of Marcellus continually preyed upon the mind of Octavia, who died of melancholy about ten years before the Christian era.

OCTAVIA, daughter of the emperor Claudius by Messalina. She was betrothed to Silanus, but by the intrigues of Agrippina she was married to the emperor Nero in the sixteenth year of her age. She was soon after divorced upon pretence of barrenness; and Nero married Poppæa, who procured her banishment into Campania. She was afterwards recalled by the people; but Poppæa, determined on her ruin, caused her again to be banished to an island, where she was ordered to kill herself by opening her veins. Her head was then cut off and carried to Poppæa.

OCTAVIANUS (Caius Julius Cæsar Octavianus Augustus), originally called Caius Octavius, was the son of a senator of the same name, who had been prætor in Macedon; and of Accia, daughter of Julia, the son of Julius Cæsar. The Octavian family had been originally settled in Velitra, in the country of the Volsci, and that branch of it from which Augustus sprung had arrived at opulence in the equestrian order. Octavianus was born during the consulate of Cicero, A. U. C. 689, and, according to the most approved chronologists, B. C. 62. At the early age of four years he lost his father, and his mother Accia contracted a second marriage with

Lucius Marcus Philippus. By the care of his mother and father-in-law he received a very liberal education in Rome, and such was his proficiency in the art of public speaking that, before he was twelve years of age, he pronounced the funeral eulogy over his grandmother Julia. His early maturity of judgment, perhaps partly owing to the necessity occasioned by his want of a father, and his discreet behaviour, recommended him to the notice of his great uncle Julius Cæsar, who declared his design of adopting him should he have no children of his own, and who would have taken him into Spain to learn the military art under himself in the war with Pompey's sons, but his mother detained him on account of his weak health. Whilst Octavianus was at Apollonia, improving his powers of eloquence under the famous Apollodorus of Pergamus, he received the news of his uncle's tragical death, and of his own adoption. Although he was dissuaded by his father and mother, and other timid friends, from declaring either his pretensions or his resentment, he determined, though only eighteen, to pass over into Italy without delay, and to judge on the spot what measures it would be proper for him to adopt. Accordingly he landed at Lupia, a small port between Brundisium and Hydruntum, and, upon his arrival, the Brundisian garrison, which was very numerous, and which consisted of veteran soldiers, went out to meet him, and introduced him in a kind of triumph into the city. Octavianus thanked them for their attachment, and, having offered a sacrifice to the gods, declared himself Cæsar's heir, and assumed the title of Caius Julius Cæsar Octavianus. Having supplied himself with money, arms, and provisions, he pursued his route through Campania; and after paying a visit to Cicero at his villa, in the neighbourhood of Cumæ, arrived at Rome, where the party of Antony and Lepidus, under a pretence of avenging Cæsar's death, had obtained universal sway. As Octavianus approached the capital he was met by most of the magistrates, the officers of the army, and the people; but Antony declined showing him any token of respect. As soon as his adoption was publicly ratified in the forum, and duly registered, he waited upon Antony; and requested to have delivered to him, as Cæsar's chief heir, the money which he had conveyed from Cæsar's house to his own, that he might be enabled to discharge his legacies. Antony's behaviour, at this interview, was haughty and imperious; his reply with regard to the money demanded, and of which part had been appropriated to his ambitious purposes, was unsatisfactory; and his address closed with reminding Octavianus, in a style of authority and menace, that the favorites of the people are, generally speaking, short-lived, and that popular affection is more inconstant than the waves of the ocean. Octavianus retired disgusted and offended; and, being aware that the consul withheld his adopted father's money and estate from him in order to disable him from purchasing the favor of the people, he sold his own patrimony, and the estates of his mother and father-in-law, and with the produce of these sales paid part of Cæsar's legacies; and by this act of generosity he so charmed the populace

that they unanimously espoused his interest, and broke out into bitter invectives against Antony for withholding Cæsar's estate.

The army near Rome, who had long wished to see the conspirators punished, began to turn from Antony to his rival, whom they saw more sincerely bent on gratifying their desires. Antony having procured also the government of Hither Gaul from the people, two of the legions that he had brought home from his former government of Macedonia went over to Octavianus. This produced, as usual, interviews, complaints, recriminations, and pretended reconciliations, which only widened the difference; so that at length both sides prepared for war. Thus the state was divided into three distinct factions; that of Octavianus, who aimed at procuring Cæsar's inheritance and avenging his death; that of Antony, whose sole view was to obtain absolute power; and that of the conspirators, who endeavoured to restore the republic. New occasions of variance continually occurred, and at length Octavianus was charged with a design of assassinating his rival, and this furnished Antony with a pretext for drawing into Italy a considerable army. Octavianus, alarmed by this hostile preparation, hastened into Campania; and having collected 10,000 veterans, who had served under Cæsar, marched immediately towards Rome. But as he had no military title, nor any magistracy which gave him a right to command forces, he thought it advisable to halt at the temple of Mars, within two miles of the city, till he obtained the consent of the people for his entry, which was soon granted him. Antony was at this time at Brundisium, and, as he was hourly expected with a considerable force, it was apprehended that the flames of a civil war would be instantly kindled within the walls of the city. Parties were formed for one and the other of these formidable rivals; and, whilst many of the senators were deliberating which side to take, Cicero, probably with a view of procuring for himself a bountiful master, declared for Octavianus. At his motion Antony, who had actually invaded the province of Cisalpine Gaul, and laid siege to Mutina, was declared an enemy to his country. On this the senate sent Octavianus, with the army he had raised, to attack him. The consuls Hirtius and Pansa joined all their forces; and, thus combined, they marched at the head of a numerous army against Antony, into Cisalpine Gaul. After one or two ineffectual conflicts both armies came to a general engagement; in which Antony was defeated, and compelled to fly to Lepidus, who commanded a body of forces in Further Gaul. The two consuls were mortally wounded; but Pansa, previous to his death, called Octavianus to his bed-side, and advised him to join with Antony, telling him that the senate only desired to depress both by opposing them to each other. The advice of the dying consul sunk deep into his mind; so that from that time he only sought a pretext to desert their party. Their giving the command of a part of his army to Decimus Brutus, and their denying him a triumph soon after, served to alienate his mind entirely from the senate, and made him resolve to join Antony and Lepidus. He was

willing, however, to try the senate thoroughly, before he came to an open rupture; wherefore he sent to demand the consulship, which was refused. He then privately sent to sound the inclinations of Antony and Lepidus concerning a junction of forces, and found them as eager to assist as the senate was to oppose him. Antony was, in fact, the general of both armies, and Lepidus was only nominally so, his soldiers refusing to obey him upon the approach of the former. Wherefore, upon being assured of the assistance of Octavianus upon their arrival in Italy, they soon crossed the Alps with an army of seventeen legions, breathing revenge against all who had opposed their designs. The senate now began, too late, to perceive their error in disobliging Octavianus, and gave him the consulship which they had so lately refused; and to prevent his joining with Antony flattered him with new honors, giving him a power superior to all law. The first use Octavianus made of his new authority was to procure a law for the condemnation of Brutus and Cassius; after which he joined his forces with those of Antony and Lepidus.

As they advanced, he went out to meet them; and their meeting took place at a small island formed by the river Rhenus, now Reno, which falls into the Po, after having watered the territory of Bologna, or Bologna. Here was planned the famous system of power called the triumvirate. Having cemented and disgraced their new connexion by the proscription, which was to cut off all their enemies public and private, and to fill their treasury by confiscations, and by the mutual sacrifice of some of their nearest friends and relations, among whom was Cicero, they proceeded to Rome, and filled the city with blood and rapine. In fulfilment of one article of the treaty, settled on this occasion, Octavianus and Antony prepared for an expedition against Marcus Brutus and Cassius, who had made themselves masters of most of the provinces in the east. Accordingly they passed over into Macedon, and met the republican leaders on the plains of Philippi, where the contest was decided by two battles, the second of which terminated with the death of Brutus. On this occasion Octavianus, who was actuated by an implacable spirit of revenge against the authors of Cæsar's death, is chargeable with a degree of cruelty which fixed an indelible stain upon his reputation.

As soon as the republican party was entirely destroyed, Antony went over into Asia, while Octavianus, who undertook to lead back the veteran troops and settle them in Italy, was assiduously employed in providing for their subsistence. He had promised them lands at home as a recompense for their past services; but they could not receive new grants without turning out the former inhabitants, which caused great discontent and disaffection. He was involved soon after in an actual civil war through the violence of Fulvia, and Antony's brother Lucius. This, however, was soon terminated by the activity of his generals, who obliged Lucius to capitulate with his forces in Perugia. This unhappy town, which had shown an inviolable attachment to Lucius,

was punished with inhuman barbarity by Octavianus, who gave it up to plunder, and condemned to death all its senate, in number 300. To the supplications and remonstrances of some of them he answered with characteristic insensibility, 'You must die.' Antony, who came to support his party in this short war, found it terminated; and a new agreement was made between him and Octavianus, in which they shared between them the Roman empire, leaving to Lepidus the African provinces. Octavianus, in this partition, had Rome and the west; and his sister Octavia was married to Antony to strengthen their union. The triumvirs had then a war to maintain with Sextus Pompey, who, being master by sea, reduced the capital to great distress for want of corn. An accommodation with him, therefore, became necessary, which took place under circumstances of apparent friendship, but such as could not be durable. In the interval of domestic peace Octavianus marched into Gaul, where he easily reduced some revolted nations. When he came back to Rome he found a new war with Pompey inevitable, and began preparing for it. In the mean time he was captivated by the charms, personal and mental, of the celebrated Livia, then the wife of Claudius Tiberius Nero. He himself was married to Scribonia, the sister of Scribonius Libo, whom he had taken, chiefly from political motives, after his repudiation of Clodia. But though she had borne him a daughter, and Livia was advanced in pregnancy, so little was his delicacy and so imperious his tyranny, that he divorced Scribonia; and, causing Livia to be divorced from her husband, immediately married her. Within three months she was delivered of a son named Tiberius, afterwards emperor.

Octavianus now resolved to rid himself of Sextus Pompeius. He was master of two fleets; one of which he had caused to be built at Ravenna, and another which Menodorus, who revolted from Pompey, brought to his aid. His first attempt was to invade Sicily; but being overpowered in his passage by Pompey, and his fleet afterwards shattered in a storm, he was obliged to defer his design till the next year. During this interval he was reinforced by a fleet of 120 ships, given him by Antony, with which he resolved once more to invade Sicily. He was again disabled and shattered by a storm: which so raised the vanity of Pompey that he began to style himself the son of Neptune. However, Octavianus having refitted his navy and recruited his forces, he gave the command of both to Agrippa, who proved himself worthy of the trust. He began his operations by a victory over Pompey; and, though he was shortly after worsted, he soon after gave his adversary a complete and final overthrow. Pompey resolved to fly to Antony, from whom he expected refuge, as he had formerly obliged that triumvir by protecting his mother. However, he tried once more, at the head of a small body of men, to make himself independent, and surprised Antony's officers, who had been sent to accept of his submissions. But he was at last abandoned by his soldiers, and delivered up to Titus, Antony's lieutenant, who caused him to be slain. The death of this general removed one very

powerful obstacle to the ambition of Octavianus, and he resolved to get rid of the rest of his associates. An offence was soon committed by Lepidus, that served as a pretext for depriving him of his share in the triumvirate. Being at the head of twenty-two legions, with a strong body of cavalry, he supposed that his power was more than equivalent to the popularity of Octavianus. He therefore resolved to add Sicily to his province; pretending a right, as having first invaded it. His colleague having previously expostulated without success, and knowing that his secret intrigues and largesses had entirely attached the army to himself, went alone to the camp of Lepidus, deprived him of all his authority, and banished him to Circæum.

The Roman world was now governed by a duumvirate; a partnership of authority which, it was evident, could not last long. While Antony, advancing to old age, acted the part of a heedless dissipated youth, enslaved to love and pleasure, the youthful Octavianus was the cool and prudent statesman, making his advantage of every false step of his colleague, and playing the game of ambition with the skill of a master. He took pains to ingratiate himself with the people of Rome, whose gratitude he in some measure deserved by the restoration of peace and plenty to all Italy. His prudent and generous action of throwing into the fire unopened a number of letters from senators, found among Pompey's papers, seemed an earnest of a milder spirit of government. He likewise solemnly declared his intention of resigning his unconstitutional power as soon as Antony should return from his Parthian war. In the mean time he accepted of the important dignity of perpetual tribune of the people, which rendered his person sacred and inviolable.

He now only waited a pretext to declare open war against Antony, and this was soon afforded him by his treatment of his wife Octavia, the sister of Octavianus. But he deferred it for a while, being then employed in quelling an insurrection of the Illyrians. The following year was taken up in preparations against Antony. Antony ordered Canidius with his army to march into Europe; while he and Cleopatra followed to Samos, to prepare for carrying on the war with vigor. The kings who attended him endeavoured to gain his favor more by their entertainments than their warlike preparations; the provinces strove rather to please him by sacrificing to his divinity, than by their alacrity in his defence. In short, his best friends now began to forsake him. His delay at Samos, and afterwards at Athens, where he carried Cleopatra to receive new honors, was extremely favorable to the arms of Octavianus; who was at first scarcely in a disposition to oppose him, had he gone into Italy; but he soon found time to put himself in a condition for carrying on the war, and shortly after declared it against him in form. All Antony's followers were invited over to join him, with great promises of rewards. Their armies were suitable to the empire they contended for. The one was followed by all the forces of the east; the other by all the strength

of the west. Antony's forces composed a body of 100,000 foot and 12,000 horse; his fleet amounted to 500 ships of war. The army of Octavianus mustered only 80,000 foot, but equalled his adversary's in number of cavalry: his fleet was but half as numerous as Antony's, however, his ships were better built, and manned with better soldiers. The great decisive engagement, which was a naval one, was fought near Actium, a city of Epirus, at the entrance of the gulf of Ambracia. Antony ranged his ships before the mouth of the gulf; and Octavianus drew up his fleet in opposition. The two land armies, on opposite sides of the gulf, were drawn up only as spectators. The battle began on both sides with great ardor; nor was there any advantage on either side, till of a sudden Cleopatra fled from the engagement attended by sixty sail; what increased the general amazement was to behold Antony himself following soon after. Yet the engagement continued with great obstinacy till five P.M. when Antony's forces submitted. The land forces soon after followed the example of the navy; and all yielded without striking a blow the fourth day after the battle. See *ROME, ANTONIUS, and CLEOPATRA*.

After the death of Antony, and after having settled the affairs of Egypt, Octavianus left Alexandria in the beginning of September, in the year of Rome 720, with a design to return through Syria, Asia Minor, and Greece, to Italy. On his arrival at Antioch he found there Tirdates, who had been raised to the throne of Parthia, in opposition to Phrahates, and ambassadors from Phrahates, who were come to solicit the assistance of the Romans against each other. Octavianus gave a friendly answer both to Tirdates and the ambassadors of Phrahates, without intending to help either; but with a design to animate the one against the other, and thus to weaken both. After this, having appointed Messala Corvinus governor of Syria, he marched into Asia, and took up his winter quarters. He spent the winter in settling the several provinces of Asia Minor and the adjacent islands; and early in spring passed into Greece, whence he set out for Rome, which he entered in the month Sextilis, afterwards called August, in three triumphs, which were celebrated for three days together. And now Octavianus was at the height of his wishes, sole master of the whole Roman empire. But, to persuade the people that they still enjoyed their ancient government, he continued the old magistrates, with the same name, pomp, and ornaments; but they were to have only subordinate military power, and their old jurisdiction of deciding finally all causes, except such as were capital; and, though some of these last were left to the governor of Rome, yet the chief he decided himself. He likewise won the hearts of the populace by the continued cheapness of provisions and plentiful markets; and he frequently entertained them with shows and sports. Having settled all affairs in the capital he passed into Gaul, towards the close of the year B.C. 27, with a design of proceeding to the reduction of the British islands; but, on his arrival at Narbonne, he received information

that the Salassians, at the foot of the Alps, and the Cantabrians and Austrians in Spain, had shaken off the Roman yoke: he therefore discontinued his progress, and marched in person into Spain, for the purpose of subduing those nations that had revolted. The conquest of the Salassians he committed to his generals. In the year B.C. 23 Octavianus married his daughter Julia to his nephew Marcellus; and in the course of the year he was seized with a dangerous disorder, which threatened his life, of which he was cured by his physician Antonius Musa. When his life was thought to be in danger he had delivered his ring to Agrippa, thus intimating that he deemed him to be a proper successor. Marcellus, who was generally regarded as his intended successor, was disgusted by this preference; but the death of this prince, who was greatly regretted by the Roman people, made way for the introduction of Agrippa to court, and from this time he continued the most confidential friend of Octavianus. At this time the administration of the empire was conducted with great equity and moderation; and many instances are recorded in which he exercised great lenity and self-denial. In the year B.C. 22 he declined the office of dictator and of censor, which were offered him by the senate, and in his general conduct he affected to appear no otherwise than as a private citizen.

Rome being now at peace, Augustus determined to visit the eastern part of the empire; but, as it was necessary to invest some person with authority in Rome during his absence, he appointed Agrippa for this purpose; and, in order to annex additional dignity to his character, he gave him in marriage his daughter Julia, the widow of Marcellus. In his progress through the eastern provinces, during the years B.C. 21 and 20, the emperor recovered from Phraates, king of Parthia, the Roman standards and captives that had been taken from Crassus; he placed Tigranes on the throne of Armenia; and at Samos, to the inhabitants of which he granted the liberty and use of their own laws, he received ambassadors from the remotest part of India. Augustus, after his return, directed his attention to various abuses which needed reform, and to the enactment of regulations that contributed to the perfection of government. He reduced the number of senators from 1000 to 600, and fixed at a higher rate the fortune that was requisite for qualifying a person to be elected of that body; and, that no persons who were eminently fit for the office, might be excluded, he made up their deficiencies of fortune by his own liberality. In the year of Rome 747, B.C. 17, he celebrated the secular games with extraordinary splendor. About this time he also adopted his two grandsons Caius and Lucius; the children of Agrippa and Julia. Having received from Gaul many complaints against the attendants whom he had appointed to levy the tribunes and imposts, and particularly against Licinius, he visited that country; but the principal aggressor, Licinius, contrived to soothe his displeasure by giving him a large portion of the treasures which he had amassed. Upon his return from Gaul, B.C. 13, the death of Lepidus

afforded him an opportunity of assuming the office of supreme pontiff; and, in the first exercise of this authority, he collected all books of divination, of which more than 2000 were committed to the flames. The books of the Sibyls, however, were preserved and entrusted to the custody of the priests. The death of Agrippa was, at this time, a very distressing event to Augustus; but it served to advance Tiberius in the family of the emperor, who by an unwarrantable act of tyranny caused him to be divorced from a wife to whom he was affectionately attached, and to marry the widowed Julia.

The war with Germany now began to be pursued with ardor. That martial people had some time before defeated Lollius, proconsul of Gaul; but Drusus marching into their country with a powerful army obtained great successes in four campaigns against their confederate tribes, and carried his arms as far as the Elbe. His brother, Tiberius, likewise subdued the Pannonians and Dacians. But the joy occasioned by these victories was damped by the death of Drusus, as he was returning to the banks of the Rhine. A peace soon after ensued; and the temple of Janus was again shut for the third time in this reign, in which state it continued twelve years. Before this event Augustus had lost his beloved sister Octavia; and soon after his favorite minister Mæcenas died, who had, indeed, for some time been less in his confidence than formerly. The emperor's intrigues with Terentia, the wife of the minister, are alleged as the cause of their coolness. During these years Augustus received many warm and unequivocal demonstrations of the affection of the people; and, after enjoying the imperial authority for twenty years, he was unanimously requested to accept it for ten years more.

The young Cæsars, grandsons to the emperor, now began to come forwards on the scene; and their early ambition gave him much disquiet. The jealousies that arose between them and Tiberius so disgusted the latter that he retired to Rhodes. In order to grace the solemnity of the assumption of the toga by his elder grandson, Caius Augustus accepted the consulate a twelfth time; and the year before its close, was rendered memorable by the birth of Christ, which event the best critics date four years before the vulgar era. Three years afterwards he was consul the thirteenth time, when Lucius Cæsar took the toga. In this year his domestic peace received a severe wound by the discovery of the scandalous disorders of his daughter Julia, of which he alone seems to have been long before ignorant. The indignation he conceived at this disgrace induced him to treat with great severity herself, and all her gallants and confidants, some of whom he put to death, and banished others.

Some troubles in Armenia, which succeeded, caused Caius Cæsar to be sent into the east, where he remained some years; but at length, A. D. 3, he received a wound which proved fatal. His brother Lucius had died some time before at Marseilles. Octavianus therefore recalled Tiberius from his unhonored residence at Rhodes, and adopted him, some months after the death of Caius. He also adopted his remaining grandson,

Agrippa Posthumus; but the intractable disposition and gross understanding of this youth caused him afterwards to annul the adoption and send him into exile. A daughter of Julia, of the same name, followed her mother's example, and some years afterwards was similarly punished. The poet Ovid was, it is said, in an unknown manner involved in her crime, and was on that account exiled to the mouth of the Danube, whence all his adulation could not procure his recall. These unworthy descendants were the source of bitter affliction to Augustus, who never named them without a sigh, and often repeated a verse from Homer, expressing a wish that he had lived in celibacy and died childless.

The year 4 was distinguished by an act of clemency which confers great honor on the character of Augustus:—Cinna, grandson of Pompey, a man of rank and great opulence, but of little merit, had formed a conspiracy against the emperor's life. Every thing was prepared for its execution, when the whole was disclosed by one of the persons engaged in it. Octavianus, by the advice of Livia, sent for Cinna to his closet, and after enumerating all the favors he had conferred upon him, charged him with the ingratitude of his design, at the same time repeating so many circumstances of the plot that Cinna could not doubt of its discovery. He proceeded to say that, being still more desirous of having him for a friend than punishing him as an enemy, he freely forgave him for all that was past, and should rely upon his future fidelity. Cinna, penetrated with compunction, and overcome by the emperor's goodness, was converted into one of his most zealous friends. Augustus named him consul for the next year; and Cinna, at his death, appointed the emperor his sole heir. Such was the effect of this conduct that this was the last conspiracy formed against him.

Various domestic regulations, and war renewed in Germany and Pannonia, which exercised the military talents of Tiberius and Germanicus, are the principal events of some succeeding years. The encouragement of matrimony, and suppression of celibacy, was a point much labored by the emperor; and a famous law, called the Papian-Poppæan (from the consuls of the year) was passed for this purpose, appointing great privileges and exemptions for the married, and penalties and disabilities for the single.

The year 9 was rendered black in the Roman annals by the destruction of Varus and three entire legions in Germany, where Arminius had formed a powerful confederacy against the power of Rome. The standards and two of the eagles fell into the hands of the enemy, who took a pride in aggravating the loss by every species of insult and indignity. This disaster nearly overcame all the fortitude of Augustus, accustomed to glory and prosperity. He put on mourning, suffered his hair and beard to grow, and frequently exclaimed, in a paroxysm of grief and despair, 'Varus, restore me my legions!' The sense of danger from a martial and inveterate foe was added to that of disgrace. Tiberius, however, by his military skill, repressed the ravages of the Germans, and in a great measure wiped off the ignominy. By his conduct he obtained the favor

and confidence of Octavianus to such a degree that he was elevated to an equal share of the imperial authority. One of the most remarkable of the remaining acts of Augustus was a tyrannical law rendering all libels and defamatory writings criminal, and subjecting the authors to the penalties of high treason.

His advanced age and declining health now rendered him studious of repose, and he devolved the principal cares of empire upon Tiberius. It is said, however, that he manifested a returning affection to his grandson Agrippa Posthumus, which alarmed Livia and her son; and Livia has been suspected of hastening the death of the emperor, on this account, by poison. But the progress of his malady is a sufficient refutation of this mere suspicion. It was a weakness of the stomach and bowels; and he was seized with it as he was conducting Tiberius towards Illyrium. On his return towards Rome his complaint increased, and obliged him to stop at Nola, where he took to his bed and patiently waited the approach of death. On the last day of his life he called for a mirror; he had his head dressed; and then calling his friends to his bed-side, asked them whether they did not think he had acted his part pretty well in the comedy of human life? and then addressed them in a Greek verse, with which they generally closed their plays:

Δοτε κροτον, και παντες υμεις μετα χαρας κτυπησα.

Clap your hands, and let all applaud with joy.

After this kind of comic adieu, he ordered every body to retire, and died in Livia's arms, saying, *Livia, conjugii nostri memor, vive et vale.* His death took place on the 10th of August A. D. 14, A. U. C. 767, and in the seventy-sixth year of his age. The duration of his power, if we reckon from the time of the triumvirate, of which he took possession the 27th of November, in the year of Rome 711, B. C. 43, was about fifty-six years. If we reckon from the battle of Actium, fought the 2d of September, in the year of Rome 721, B. C. 31, when his sole possession of the Roman empire properly commences, Augustus will then appear to have enjoyed the sovereign power about forty-four years.

Crevier states the true time of his becoming emperor to have been the 7th of January, in the year of his seventh consulship, which, according to his reckoning, was the 725th of Rome, and, referring his death to the 765th of Rome, he governed as prince and emperor forty years, seven months, and thirteen days. 'All the rest,' he says, 'was manifest usurpation and tyranny.' Josephus, and others after him, compute the beginning of the reign of Augustus from the year in which Cæsar was killed, A. U. C. 710, B. C. 44, and make its duration fifty-seven years, six months, and some odd days. Ptolemy in his canon, and St. Clement of Alexandria, date the commencement of his reign in the year after the battle of Actium, A. U. C. 724, and compute its duration to be forty-three years.

Before the funeral of Augustus his will was presented to the senate-house by the vestal virgins, in whose custody it had been deposited, and read aloud by Polybius, one of his freedmen. By this will, made sixteen months before his

death, Tiberius and Livia were appointed his first heirs, his grand-children and their children his second, and the great men of Rome his third heirs. Livia was adopted into the Julian family, and honored with the title of Augusta. He bequeathed as a legacy 40,000,000 of sesterces (about 5,000,000 of livres) to the Roman people; 3,500,000 (437,500 livres) to the tribes, that is 100,000 (12,500 livres) to each; to each of his guards 1000 sesterces (125 livres); to each of the soldiers appointed to guard the city 500 sesterces (sixty-two livres); and to each legionary soldier 300 sesterces (thirty-seven livres).

Gibbon has given the following sketch of the character and history of Augustus:—'The tender respect of Augustus for a free constitution, which he had destroyed, can only be explained by an attentive consideration of the character of that subtle tyrant. A cool head, an unfeeling heart, and a cowardly disposition, prompted him, at the age of nineteen, to assume the mask of hypocrisy, which he never afterwards laid aside. With the same hand, and probably with the same temper, he signed the proscription of Cicero and the pardon of Cinna. His virtues, and even his vices, were artificial, and according to the various dictates of his interest, he was at first the enemy, and at last the father of the Roman world. When he framed the artful system of the imperial authority his moderation was inspired by his fears. He wished to deceive the people by an image of civil liberty, and the armies by an image of civil government.

'In the exercise of that sovereign and absolute power which he acquired, by means which none can attempt to justify, and which he contrived most effectually to secure by apparent moderation and self-denial, he seems to have been solicitous for making the people contented and happy; and in many respects he was entitled to the character of a wise and equitable governor. 'As a compensation for liberty, he gave his subjects security, ease, prosperity, and all the advantages of high civilisation, with as little as possible of the severity of restraint and coercion. He filled Rome and all Italy with improvements of every kind: made highways, constructed harbours, raised edifices for use and convenience, and could boast that he received a capital of brick, and left one of marble. He so encouraged letters that one of the great ages of excellent human productions takes its name from him.' Those whom he encouraged by his liberality repaid him with an adulation which was not honorable to themselves, and which made no addition to his reputation. The love of flattery, however, is not charged upon him as one of his predominant foibles. In private life he had many estimable qualities. Affectionate to his family and friends, condescending and indulgent to his domestics and dependents, frugal and sober with regard to every indulgence, one excepted, which regarded himself, he commanded affection and respect. But his disposition to gallantry and licentiousness in his conduct towards the female sex exposed him to just censure and reproach; nor did the counsel of his friends, nor the wisdom of experience, avail to the due restraint of his cri-

minal passions. Sometimes indeed, it has been said, his intrigues were the result of that policy which directed his general conduct, as they served to discover secrets of state, and to obtain information concerning any plot or sedition that might have been formed by the husbands of those wives with whom he was connected. In other respects he paid a high regard to external decorum; and, whatever might have been his sentiments with regard to religion in early life, he appears in maturer and more advanced age to have been much inclined to superstition.

OCTA'VO, *adj.* & *n. s.* Lat. *octavo*. Applied to a page or leaf constituting the eighth part of a sheet.

They accompany the second edition of the original experiments, which were printed first in English in *octavo*. *Boyle.*

Lord C—'s works most resplendently bound in *octavo*, form a conspicuous ornament to his book shelves.

The rest is all but leather and prunella.

Byron.

OCTEN'NIAL, *adj.* } Lat. *octennium*, *octo-*
OCTOG'ENARY. } *geni.* Happening every
eighth year; lasting eight years: octogenary is,
of eighty years of age.

OCTO'BER, *n. s.* Lat. *october*. The eighth month in the year; also a name given to ale brewed in that month.

October is drawn in a garment of yellow and carnation; upon his head a garland of oak leaves, in his right hand the sign scorpio, in his left a basket of services. *Peacham.*

Nor wanting is the brown *October* drawn
Mature and perfect, from his dark retreat
Of thirty years, and now his honest front
Flames in the light refulgent, not afraid
Even with the vineyard's best produce to vie.

Thomson.

OCTOBER, in chronology, was the eighth month of Romulus's year, which the name implies; but the tenth in the kalendar of Numa, Julius Cæsar, &c. The senate gave this month the name Faustinus, in compliment to Faustina, the wife of the emperor Antoninus; Commodus would have it called Invictus; and Domitian named it Domitianus. This month was sacred to Mars, and under his protection.

OCTOBRIS EQUUS, a horse annually sacrificed to Mars in October, because the horse is a warlike animal. A race was run with chariots drawn by two horses, previous to the sacrifices, and he that ran quickest was adjudged to be the victim.

OCTONARY, *adj.* } Lat. *octonarius*, *octu-*
OCTUPLE. } *plus.* Belonging to the
number of eight; eightfold.

OCTONOCULAR. Latin *octo* and *oculus*. Having eight eyes.

Most animals are binocular; spiders for the most part *octonocular*, and some *senocular*. *Derham.*

OCTOPETALOUS, *adj.* Gr. *οκτω* and *πεταλον*. Having eight flower leaves.

OCTOSTYLE. Gr. *οκτω* and *στυλος*. In architecture, the face of a building having eight columns.

OCULAR, *adj.* } Fr. *oculaire*, of Lat.
OCULARLY, *adv.* } *oculus*. Relating to, or
OCULATE, *adj.* } seen by, the eye: ocu-
OCULIST, *n. s.* } larly, visibly by the eye:
OCULUS BELI, *n. s.* } oculate is, having eyes;
 having perception by the eye: oculist, he who
 studies or professes to cure diseases of the eye:
oculus belli, Woodward will define.

Prove my love a whore,
 Be sure of it; give me the *ocular* proof,
 Or thou hadst better have been born a dog.

Shakespeare.

If there be a speck in the eye, we take it off; but
 he were a strange *oculist* who would pull out the eye.

Bacon.

He that would not believe the menace of God at
 first, it may be doubted whether before an *ocular*
 example he believed the curse at first. *Brown.*

The same is *ocularly* confirmed by Vives upon
Id.

The *oculus belli* of jewellers, probably of Pliny, is
 an accidental variety of the agate kind; having a
 grey horny ground, circular delineations, and a spot
 in the middle, resembling the eye; whence its name.
Woodward.

OCULUS BELI, in li.hology, one of the se-
 mipellucid gems, of a grayish-white color, varie-
 gated with yellow and with a black central nu-
 cleus: it is of a roundish form, and its varia-
 gations very beautifully represent the pupil and
 iris of the eye: whence the name. It seems to
 be a species of opal.

OCUMARA, a bay of Venezuela, Colombia,
 five leagues east of Porto Cabello, and about
 twenty-eight miles S.S.E. of the city of Ca-
 racas. Its port is good and is defended on the
 east by a battery mounting eight pieces of cannon.
 The town, at the distance of one league from the
 port, is watered by a river of the same name,
 which discharges itself into the bay.

OCYUM, basil, a genus of the gymno-
 spermia order, and didynamia class of plants;
 natural order forty-second, verticillatæ: CAL.
 upper lip orbiculated, inferior one quadrifid:
 cor. resupinated, with one lip quadrifid, the
 other undivided; the exterior filament sends out
 a reflected process at the base. There are eight
 species, all natives of warm climates, rising from
 six inches to two feet in height, and having a
 strong aromatic smell, resembling that of cloves.
 One species is used in the kitchen in soups and
 sauces. It rises about ten inches high, sending
 out branches by pairs opposite, from the bottom;
 the stalks and branches are four-cornered; the
 leaves are oval, spear-shaped, ending in acute
 points, and are indented on their edges; the
 whole plant is hairy, and has a strong scent of
 cloves, too powerful for most persons, but to some
 it is very agreeable. These plants are propagated
 by seeds, will thrive in this country in the open
 air, and will even ripen their seeds if placed in
 a stove or airy glass-case.

OCZAKOV, a town of the government of
 Cherson, European Russia, near the mouth of
 the river Dnieper. This place was never of great
 size; and, since the building of Odessa, its trade
 and population have greatly dwindled; but the
 Russians and Turks have often disputed its pos-
 session. In 1737 it was attacked by the former
 under count Munich, and carried by assault.

Being afterwards abandoned, it was fortified by
 the Turks; and in 1788 attacked again by a
 Russian army under prince Potemkin, who did
 not take it till after a delay of six months, and a
 great sacrifice of lives. The restoration of this
 place to Turkey by Russia, formed the alleged
 motive for the interference of the British go-
 vernment against the latter power in 1790. It
 is fifty-four miles west by south of Cherson.

ODA-BACHI, or **ODDABASSI**, an officer in the
 Turkish soldiery, equivalent to a serjeant or cor-
 poral among us. The common soldiers and ja-
 nissaries, called *oldachis*, after having served a
 certain term of years, are always preferred and
 made *biquelairs*; and of *biquelairs* in time be-
 come *odabachis*, i. e. corporals of companies, or
 chiefs of certain divisions, whose number is not
 fixed being sometimes ten and sometimes
 twenty. Their pay is six doubles per month;
 and they are distinguished by a large felt, a foot
 broad and above a foot long, hanging on the
 back, with two long ostrich feathers.

ODD, *adj.* } Arab. *uhud*; Swed. *udda*;
ODD'LY, *adv.* } Goth. *eitt* (one). Sole; single;
ODD'NESS, *n. s.* } not divisible by two; not even
ODDS, *n. s.* } or twofold; hence singular;
 particular; unusual; uncouth; unnoticed; strange;
 unlucky (see the instance from Shakespeare); but
 some learned gossips in 'luck' consider the odd
 a lucky number: oddly and oddness follow all
 the above senses: odds is used to express in-
 equality; excess on either side of a comparison;
 more than even in a wager; more likely than
 otherwise; hence advantage; superiority; also,
 from the notion of strangeness, uncouthness, it
 signifies difference amounting to dispute; de-
 bate; quarrel.

The odd man to perform all three perfectly is,
 Joannes Sturmius. *Ascham's Schoolmaster.*

The case is yet not like, but there appeareth great
 odds between them. *Spenser on Ireland.*

Between these two cases there are great odds.
Hooker.

This is the third time; I hope
 Good luck lies in odd numbers. *Shakespeare.*

The trust Othello puts him in,
 On some odd time of his infirmity,
 Will shake this island. *Id. Othello.*

There are yet missing some few odd lads that you
 remember not. *Id. Tempest.*

How oddly will it sound, that I
 Must ask my child forgiveness. *Id.*

I will lay the odds that ere this year expire,
 We bear our civil swords and native fire
 As far as France. *Id. Henry IV.*

The fox, the ape, and the humble bee,
 Were still at odds, being but three;
 Until the goose came out of door,
 And staid the odds by adding four. *Shakespeare.*

Her madness hath the oddest frame of sense,
 Such a dependency of thing on thing,
 As e'er I heard in madness.

Shakespeare. Measure for Measure.

The account of the profits of Ulster, from the
 fifth year of Edward III. until the eighth, do amount
 but to nine hundred and odd pounds.

Davies on Ireland.

Shall I give him to partake
 Full happiness with me? or rather not,
 But keep the odds of knowledge in my power
 Without co-partner? *Milton's Paradise Lost.*

And tho' the sword, some understood,
In force had much the *odds* of wood,
'Twas nothing so; both sides were balanced
So equal, none knew which was valiant'st.

Hudibras.

What verity there is in that numeral conceit, in the lateral division of man by even and *odd*; ascribing the *odd* unto the right side, and the even unto the left; and so, by parity or imparity of letters in men's names, to determine misfortunes. *Browne.*

Cromwell, with *odds* of number and of fate,
Removed this bulwark of the church and state.

Waller.

The year, without regard to days, ends with an *odd* day and *odd* hours, *odd* minutes, and *odd* seconds of minutes; so that it cannot be measured by any even number of days, hours, or minutes. *Holder.*

Coveting to recommend himself to posterity, Cicero begged it as an alms of the historians, to remember his consulship; and, observe the *oddness* of the event, all their histories are lost, and the vanity of his request stands recorded in his own writings.

Dryden.

The dreams of sleeping men are made up of the waking man's ideas, though for the most part *oddly* put together. *Locke.*

All these, thus unequally furnished with truth, and advanced in knowledge, I suppose of equal natural parts; all the *odds* between them has been the different scope that has been given to their understandings to range in. *Id.*

When I broke loose from writers who have employed their wit and parts in propagating of vice, I did not question but I should be treated as an *odd* kind of a fellow. *Spectator.*

Mr. Locke's Essay would be a very *odd* book for a man to make himself master of, who would get a reputation by critical writings. *Id.*

Sixteen hundred and *odd* years after the earth was made, it was destroyed in a deluge of water.

Burnet's Theory.

Since every man by nature is very prone to think the best of himself, and of his own condition, it is *odds* but he will find a shrewd temptation. *South.*

No fool Pythagoras was thought;
He made his list'sing scholars stand,
Their mouth still covered with their hand:
Else, may be, some *odd* thinking youth,
Might have refused to let his ears
Attend the musick of the spheres. *Prior.*

As masters in the clare obscure,
With various light your eyes allure:
A flaming yellow here they spread;
Draw off in blue, or charge in red;
Yet from these colours *oddly* mixed,
Your sight upon the whole is fixed. *Id.*

One man is pressed with poverty, and looks somewhat *oddly* upon it. *Collier on the Spleen.*

A knave is apprehensive of being discovered; and his habitual concern puts an *oddness* into his looks. *Collier.*

This blue colour, being made by nothing else than by reflection of a specular superficies, seems so *odd* a phenomenon, and so difficult to be explained by the vulgar hypothesis of philosophers, that I could not but think it deserved to be taken notice of.

Newton's Opticks.

Patients have sometimes coveted *odd* things which have relieved them; as salt and vinegar. *Aruthnot.*

Fossils are very *oddly* and elegantly shaped, according to the modification of their constituent salts, or the cavities they are formed in. *Bentley.*

So proud I am no slave,
So impudent I own myself no knave,
So *odd*, my country's ruin makes me grave. *Pope.*

The presbyterian party endeavoured one day to introduce a debate about repealing the test clause, when there appeared at least four to one *odds* against them. *Swift.*

They had seen a great black substance lying on the ground very *oddly* shaped. *Id.*

My wife fell into a violent disorder, and I was a little discomposed at the *oddness* of the accident. *Id.*

To counterpoise this hero of the mode,
Some for renown are singular, and *odd*;
What other men dislike is sure to please
Of all mankind these dear antipodes. *Young.*

SIR BENJ.—Oh lud, ma'am, how very *odd*, but that is the reason it was believed at once. *Sheridan.*

ODE, n. s. Gr. ὠδή; Latin *ode*. A lyric poem; a poem set to music. See below.

A man haunts the forest that abuses our young plants with carving Rosalind on their barks; hangs *odds* upon hawthorns, and elegies on brambles, all forsooth deifying the name of Rosalind.

Shakespeare.

O run, prevent them with thy humble *ode*,
And lay it lowly at his blessed feet. *Milton.*

He would an elegy compose,
On maggots squeezed out of his nose;
In lyric numbers wrote an *ode* on
His mistress eating a black pudden.

Butler's Hudibras.

What work among you scholar gods!
Phœbus must write his am'rous *odes*;
And thou, poor cousin, must compose,
His letters in submissive prose. *Prior.*

However, I have some *odes* and love-elegies, which, when I am favoured with the lady's name for whom they are to be written, I intend to give to the public.

Sheridan.

Laugh when I laugh, I seek no other fame,
The cry is up, and scribblers are my game;
Speed Pegasus, ye strains both great and small,
Ode, epic, elegy, have at ye all. *Byron.*

ODE. Among the ancients the ode signified no more than a song, but with the moderns they are reckoned different compositions; the ode being usually appropriated to grave, lofty, and solemn subjects. Horace has pointed out the subjects proper for both, in few words:—

Gods, heroes, conquerors, Olympic crowns,
Love's pleasing care, and the free joys of wine,
Are proper subjects for the Lyric song.

It was also employed, not only to praise the Almighty for bounties received, but to solicit him in time of trouble, as is plain from the odes written by king David, Asaph, &c., and collected by Ezra into the books of Psalms. Many other nations imitated the Israelites in songs of praise and petitions addressed to their deities. This afterwards gave rise to the custom of the heathen poets invoking the Muses; still ridiculously kept up by modern Christian poets, as if these ideal deities of Parnassus had a real existence.

This fancied inspiration led the ancient lyric poets to indulge in a more unbounded liberty in this than in any other species of poetry; soaring in sudden transitions, bold digressions, and lofty excursions, sometimes away from their subject altogether. But Pindar, the most daring and lofty of all the lyric poets, in his sublimest flights, and amidst all his raptures, returning to his subject again, has preserved harmony, and often uniformity in his versification; yet so great is his variety of measures that the traces of

ness are hardly perceptible; and this is one of the excellencies for which he is admired, and which, though seemingly void of art, requires so much, that he has seldom been successfully imitated.

ODENATUS, a celebrated prince of Palmyra. He very early inured himself to bear fatigues, and, by hunting leopards and wild beasts, accustomed himself to the labors of a military life. He was a faithful friend to the Romans; and, when Aurelian was taken prisoner by Sapor king of Persia, Odenatus solicited his release, by writing to the conqueror, and by sending him presents. The Persian tyrant was offended at this liberty, tore the letter, and ordered the presents to be thrown into a river; and commanded Odenatus to appear before him, on pain of being devoted to instant destruction. Odenatus despised this haughty summons, and opposed force by force. He obtained considerable advantages over the troops of Sapor, and took his wife prisoner, with a great booty. In return for these services Gallienus, then emperor, named Odenatus his colleague, and gave the title of Augustus to his children and of Augusta to his wife, the celebrated Zenobia. On his return from this expedition he marched against the Goths or Scythians, who had invaded Asia, and obliged them to make a hasty retreat. Shortly after this he fell a victim to domestic treason. His nephew Maonius, when hunting with him, presumed to throw his javelin before that of his uncle; and though reproved repeated the offence. Odenatus, provoked at this show of insolence, took away his horse, a mark of infamy among the barbarians, and ordered the youth into confinement. The offence was soon forgotten, and Maonius restored, but the punishment was remembered, and he caused his uncle to be assassinated in the midst of an entertainment, at Emessa, about A.D. 267, and Zenobia succeeded him. See **PALMYRA**.

ODENSEE, a town of Denmark, the capital of Funen, is situated on a river which runs into a large bay of that island about a mile from the town. It is a bishop's see, and though not large is of note for its manufactures, chiefly of woollens, leather, and soap. Here are an old palace, cathedral, and several churches worth notice. The Danish language is spoken with great purity, and education is well attended to. At a diet held here, in 1528, the Protestant discipline of the Danish church was settled. Population 6000. Eighty-six miles W. S. W. of Copenhagen, and sixty-eight N. N. E. of Sleswick.

ODEON, or **ODEUM**, in ancient architecture Gr. ὀδεῖον, from ὀδῆ a song, a name given among the Greeks to a species of theatre in which the poets and musicians submitted their works to the approval of the public, and disputed for prizes. This, however, it is probable was not the original object for which Pericles built that at Athens, which served as a magazine wherein to deposit all the paraphernalia used in religious and other solemn processions, and had likewise another destination, namely that of offering under its portico a shelter to the spectators assembled in the theatre of Bacchus (by the side of which it was erected) in case of surprise from bad weather:

It was not, apparently, until a later period that the odeon became itself a theatre or saloon for the purposes of music and declamation. Sometimes, even, it is said to have been used by the Archontes, as a council-house in which they dispensed justice.

The form of the odeons resembled that of other theatres, except that they were inferior in point of extent, and were covered with a roof. The inside of that built by Pericles, before alluded to, was filled with seats and ranges of pillars, and on the outside the roof descended shelving downwards from a point in the centre, with many bendings, in imitation of a famous pavilion of the king of Persia. Vitruvius is of opinion that the roof of this building was constructed of the masts or sail-yards of Persian ships which the Athenians had taken in their war with that people.

ODER, a considerable river of Germany and the Prussian states, rises in Moravia, about eighteen miles north-east of Olmutz, enters Silesia, and flows through that province, Brandenburg, and Pomerania, where it forms the large maritime lake called the Haff, and runs into the Baltic by three mouths, the Peene, the Swine, and the Divensa. These streams form here two large islands called Usedom and Wollin. In Silesia this river has a very rapid course; but, on reaching the level ground, this impetuosity diminishes; but it here frequently overflows its banks. It becomes navigable for small boats at Ratisbon, and vessels of fifty tons reach Breslau: it receives numerous tributaries, and communicates by canals with both the Elbe and the Vistula. Breslau, Frankfort, and Stettin are on its banks.

ODERICO (Gasper Lewis), a learned Genoese antiquary and medallist, entered early into the society of the Jesuits, and going to Rome became professor of theology. He was admitted a member of the Etruscan academy of Cortona, under the name of Theodemio Ostracino. On the suppression of his order he retired to his native city, where he was made conservator of the university library. In 1787 he went to Turin with his brother, to conduct some negotiations, and remained there six years. The revolution deprived him of his office at Genoa, but on the reorganisation of the university he was replaced, and chosen a member of the Institute. He died December 10th, 1803, of apoplexy, aged seventy-eight. He published several valuable works on ancient medals and inscriptions; and left in MS. *Notizie istoriche sulla Taurica fino all' anno 1475*, written at the request of the empress Catherine.

ODEYPOOR, a fertile Hindoo principality in the province of Ajmeer, of which it occupies the south-eastern quarter, and situated between 24° and 26° of N. lat. It yields sugar, indigo, cotton, and the grains of India: it also produces mines of iron and sulphur. It formerly bore the appellation of Mewar; and its chief, who is of the Rajpoot, or military tribe, is descended of the most ancient and honorable family in Hindostan, frequently denominated in history the Ranahs of Chitore. The present territories of this prince are estimated at 110 miles in length by seventy in breadth. The lands are held on a sort

of feudal system, every Rajpoot being a soldier by profession; but, owing to the frequent inroads of the Mahrattas, the revenues have been greatly diminished. The cultivators of the soil are Hindoos, of the tribes of Brahmin, Jaut, Bheel, and Rajpoot; the weapons of the latter, which he frequently carries into the fields with him, while ploughing, &c., are a lance, sword, matchlock, or bow and arrow. The cattle here are smaller than in the neighbouring countries; but they breed a number of sheep and camels.

ODEYPOOR, the capital of the above district, is situated on the south side of the Banass, in an amphitheatre of hills. It can only be approached through three narrow defiles, barely wide enough to admit a carriage. When, in the beginning of the fourteenth century, Chitore, the former capital, was taken by the Mahometans, the royal family took refuge in this place, and the alliance of the Ranah has been always sought by the neighbouring Hindoo princes. Through his alliance with the British he has been enabled to throw off the Mahratta yoke. Long. $74^{\circ} 5' E.$, lat. $25^{\circ} 28' N.$

ODESSA, a thriving modern sea-port of Southern Russia, in the government of Cherson, stands on a bay of the Black Sea between the mouths of the Dniester and Dnieper. Russia, it is well known, particularly after her acquisitions in south-east Poland, had long looked for an establishment in this direction. At the peace of Jassy Catherine II. fixed in 1792 on this place, then called Kodjabeg, and consisting of only a few houses. But without having a river it has a fine bay, with sufficient depth of water almost to the edge for large ships of war. Its bottom is of fine sand or gravel, and it is hardly ever frozen. The public works were quickly constructed, and the emperor Alexander followed up the views of Catharine, and greatly benefited the new town by the judicious selection of the duke of Richelieu, at that time a French emigrant nobleman, as its governor. Under his superintendence a number of excellent establishments were set on foot, under the patronage of the government. In 1804 the population had risen to 15,000; and when Dr. Lyall was here in 1824 to 40,000.

Odessa stands in lat. $46^{\circ} 29' 30'' N.$, and long. $30^{\circ} 45' 22''$, as astronomically ascertained, on the declivity of a considerable eminence in the south-west of the bay of Adschai, and in the midst of a number of fertile plains. The streets are laid out with great regularity and generally intersect each other at right angles; some are very long, but all of them unpaved: the houses are not generally contiguous but separated by a portion of garden ground. They are neatly built of stone, with roofs of wood, or sheets of iron, the stone of which they are constructed being the same as the rock on which the town is built,—a semi-indurated limestone, exhibiting throughout its entire mass an assemblage of small cockle-shells, tinged with an iron oxide. Odessa contains seven churches, an admiralty court, a custom-house, hospital, theatre, several inns, a lyceum, and schools for trade and navigation, and for the instruction of girls. The air is pure and remarkably wholesome; but it labors under the want of

fresh water. A large export trade in corn is conducted with England, France, Spain, Italy, the Levant, and Germany. The articles of importation are wines, liqueurs, tobacco, cotton stuffs, cloth, perfumes, shawls, oil, spices, porcelain, and paper. Other exports latterly have been butter, caviare, tallow, hog's-lard, ironmongery from Tula, furs, &c. About 800 vessels arrive annually; 400 of which are British. The villages in the neighbourhood produce the rarities in the south of Russia, of butter and cheese, potatoes, and remarkably fine melons. The mutton here is also very fine. Fuel is scarce; and bundles of weeds, and cow-dung, are used as a substitute.

The Greek inhabitants are the most numerous: and are chiefly retail merchants and workmen. The Russians are principally servants: the most wealthy and powerful are the French, English, and Germans. Jews abound, but they are mostly poor. The corn brought hither from the Ukraine and neighbouring provinces is conveyed chiefly in carts or waggons drawn by oxen, which travel in companies, and stop at intervals, to let the oxen feed in the steppes or vast natural pastures of the road, so that the expense of carriage is trifling. In summer several hundred waggons arrive in the town in a single day. Other articles produced in the Ukraine, and exported at Odessa, are tallow, hides, flax, and timber. Brewing and distilling are carried on on a large scale; and there are manufactures of woollens, silk, gunpowder, and soap. The great disadvantages hitherto have been the want of water, of mechanics for the town, and of farmers for the surrounding district. The government has spared no expense to procure all of these; and those who fix on the country round Odessa are allowed a house, a pair of oxen, a plough, a little money, and an exemption, during twenty-five years, from all taxes and military service.

ODIN, in Saxon mythology, called also in the dialect of the Anglo-Saxons Woden, or Wodan, a name given by the ancient Scythians to their supreme god.

ODIN, in Saxon history, a name assumed about A. A. C. 70 by Sigge, a Scythian prince, who conquered the northern nations, made great changes in their government, manners, and religion, enjoyed great honors, and had even divine honors paid him. According to the account given of this conqueror by Snorro, the ancient historian of Norway, and his commentator Torsæus, Odin was a Scythian, who withdrew himself, with many others in his train, by flight, from the vengeance of the Romans, under Pompey; and, having officiated as priest in his own country, he assumed the direction of the religious worship, as well as the civil government, of the nations which he conquered. Having subdued Denmark, Sweden, and Norway, he retired to Sweden where he died. Dr. Henry gives this account of him: 'Odin is believed to have been the name of the one true God among the first colonies who came from the east and peopled Germany and Scandinavia, and among their posterity for several ages. But at length a mighty conqueror, the leader of a new army of adventurers from the east, over-run the north of Europe, erected a great empire, assumed the name of Odin, and claimed the ho-

nors which had been formerly paid to that deity. From thenceforward this deified mortal, under the name of Odin or Wodin, became the chief object of the idolatrous worship of the Saxons and Daues in this island, as well as of many other nations. Having been a mighty and successful warrior, he was believed to be the god of war, who gave victory, and revived courage in the conflict. Having civilised, in some measure, the countries which he conquered, and introduced arts formerly unknown, he was also worshipped as the god of arts and artists. He was at the same time a priest, a soldier, a poet, a monarch, and a victor. He imposed upon the credulity of his superstitious countrymen, and made them believe that he could raise the dead, and that he was acquainted with futurity. When he had extended his power and increased his fame by conquest and by artifice, he determined to die in a different way from other men. He assembled his friends, and with the sharp point of a lance he made in his body nine different wounds in the form of a circle; and, when expiring, he declared that he was going to Scythia, where he should become an immortal god. He added that he would prepare bliss and felicity for those of his countrymen who lived a virtuous life, who fought with bravery, and who died like heroes in the field of battle. These injunctions had the wished-for effect: his countrymen superstitiously believed him, and constantly recommended themselves to his protection when they engaged in battle; and they entreated him to receive the souls of such as fell in war. In a word, to this Odin his deluded worshippers impiously ascribed all the attributes which belong only to the true God; to him they built magnificent temples, offered many sacrifices, and consecrated the fourth day of the week, which is still called by his name Woden's day, or Wednesday, in England and in all the other countries where he was formerly worshipped. Notwithstanding all this, the founders of all the kingdoms of the Anglo-Saxon heptarchy pretended to be descended from Wodin, and some of them at the distance only of a few generations. His wife's name was Frea. See MYTHOLOGY. Gräter, with great boldness, insists that the island Sams, mentioned in the Edda, is the Samos of the Archipelago; and, from some faint resemblance between the Gothic cosmogony and that of a Samian philosopher, he infers Odin to have been a pupil of Melissus; and thus he throws back his antiquity to a period which would make it probable that the Scythian kings of Herodotus are the heroes deified in Gothic song. Mallet defends the equally wild conjecture that the arms of Pompey occasioned Odin to migrate from the Euxine to the Baltic. In this case, Pliny and Tacitus would have met with traces of his progress among the nations whom they describe. Extensive recent conquests, terminating in the imposition of a new religion, could not but live in the memory even of barbarians. It is therefore most probable that Odin is posterior to these writers, and that the Anglo-Saxon historians are correct, who describe Hengist as fifth in descent from Odin, and who have preserved the intervening pedigree. An interval of 125 years would then be

sufficient to allow between Odin himself and his grandson Vecta's great-grandson, Hengist. This would place Odin in the year of Christ 325, about seventy years before Alaric, and would plausibly account for the momentous impulse which, about that time, propelled the Gothic multitudes against all the provinces of the Roman empire.

Odin is called in the Edda, and by Snorro, Runhofdi and Runomfauthr, father of letters, king of spells, as the poets phrase it; which favors the opinion that he introduced the art of writing among the Goths. Now Tacitus expressly pronounces the alphabet to have been unknown to the Germans; *litterarum secreta viri pariter ac fœminæ ignorant*; Odin, then, must have lived subsequently to this period. The oldest Runic inscriptions on stone commemorate the fortunes of soldiers who had served at Constantinople in the corps of Varangi; and the art of stone cutting in the north is therefore posterior to the transfer of the seat of empire from Rome to Constantinople. Now Odin, according to Snorro, first introduced the practice of using grave-stones: in his time, no doubt, they were simply inscribed, not engraved: but these cannot long have preceded the more permanent memorials. This circumstance, again, tends to corroborate a chronology which places Odin at the beginning of the fourth century.

De ODIO ET ATIA. The writ *de odio et atia* was anciently directed to the sheriff, commanding him to enquire whether a prisoner charged with murder was committed upon just cause of suspicion, or merely propter odium et atiam, for hatred and ill-will; and if upon the inquisition due cause of suspicion did not then appear, then there issued another writ for the sheriff to admit him to bail. This writ, according to Bracton, ought not to be denied to any man; it being expressly ordered to be made out gratis, without any denial, by magna charta, c. 26, and stat. Westm. 2. 13, Edw. I. c. 29. But the statute of Gloucester, 6 Edw. I. c. 9, restrained it in the case of killing by misadventure or self-defence; and the statute 28 Edw. III. c. 9 abolished it in all cases whatsoever; but, as the stat. 42 Edw. III. c. 1 repealed all statutes then in being contrary to the great charter, Sir Edward Coke is of opinion that the writ *de odio et atia* revived. See HABEAS CORPUS.

O'DIOUS, adj. } *Fr. odieux; Lat. odiosus,*
O'DIOUSLY, adv. } *odium.* Hateful; invidious;
O'DIOUSNESS, n. s. } *ous; exposed to, or caus-*
O'DIUM. } *ing hate: odiously and*
 odiousness follow these senses: odium, quality or state of provoking hatred; hence invidiousness; disrepute; badness of character; opprobrium.

There was left of the blood royal an aged gentleman of approved goodness, who had gotten nothing by his cousin's power but danger from him, and *odiousness* for him. *Sidney.*

Another means for raising money was, by inquiring after offences of officers in great place, who, as by unjust dealing they became most *odious*, so, by justice in their punishment, the prince acquired both love and applause. *Hayward.*

The *odium* and offences which some men's rigour

or remissness had contracted upon my government, I was resolved to have expiated. *King Charles.*

He had rendered himself *odious* to the parliament. *Clarendon.*

The seventh from thee,
The only righteous in a world perverse,
And therefore hated, therefore so beset
With foes, for daring single to be just,
And utter *odious* truth, that God would come
To judge them with his saints.

Milton's Paradise Lost.

Had thy love, still *odiously* pretended,
Been as it ought, sincere, it would have taught thee
Far other reasonings. *Milton's Agonistes.*

Harsh speech rendereth advice *odious* and unsavoury to the receiver. *Barrow.*

Let not the Trojans, with a feigned pretence
Of proffered peace, delude the Latian prince:
Expel from Italy that *odious* name. *Dryden.*

Arbitrary power no sober man can fear, either
from the king's disposition or his practice; or even
where you would *odiously* lay it, from his ministers. *Id.*

She threw the *odium* of the fact on me,
And publicly avowed her love to you. *Id.*

For ever all goodness will be most charming; for
ever all wickedness will be most *odious*. *Sprat.*

Hatred is the passion of defence, and there is a
kind of hostility included in its very essence. But
then, if there could have been hatred in the world,
when there was scarce any thing *odious*, it would
have acted within the compass of its proper object. *South.*

Projectors, and inventors of new taxes, being
hateful to the people, seldom fail of bringing *odium*
upon their master. *Davenant.*

She breathes the *odious* fume
Of nauseous steams, and poisons all the room. *Granville.*

Green fields, and shady groves, and crystal springs,
And larks, and nightingales, are *odious* things;
But smoke, and dust, and noise, and crowds, delight. *Young.*

MAR. Such reports are highly scandalous.

MRS. C. So are they child, shameful, *odious*. But
the world is so censorious no character escapes. *Sheridan.*

ODO, or ST. ODO, second abbot of Clugni in France, illustrious for learning and piety in the tenth century. The sanctity of his life contributed greatly to enlarge the congregation of Clugni; and he was so esteemed that bishops, and secular princes, usually chose him for the arbiter of their disputes. He died about the year 942, and his works are printed in the Bibliothéque of Clugni.

ODO CANTIANUS, so called as being a native of Kent in England, was a Benedictine monk in the twelfth century, in which order his learning and eloquence raised him to the dignity of prior and abbot. He was the intimate friend of archbishop Becket. He composed Commentaries on the Pentateuch and the 2nd Book of Kings; Moral Reflections on the Psalms; treatises entitled De Onere Philistim; De Moribus Ecclesiasticis; De vitis et virtutibus Animæ, &c.

ODOACER, king of the Heruli, according to Ennodius, was only a private man in the guards of the emperor Augustulus, when (A.D. 476,

under the consulship of Basilicus and Armatus) the barbarians chose him for their leader. The barbarians thought, as they often defended Italy, they had a right at least to part of it; but, upon demanding it, they were refused, and the consequence was a revolt. Odoacer is said to have been a man alike capable of commanding an army or governing a state. Having left his own country when he was very young, to serve in Italy, as he was remarkably tall, he was admitted among the emperor's guards, and continued in that station till the above year; when, putting himself at the head of the barbarians in the Roman pay, who, though of different nations, had unanimously chosen him for their leader, he marched against Orestes and his son Augustulus, who still refused to share any of the lands in Italy. The Romans, being inferior both in numbers and valor, were easily conquered: Orestes was ordered to be slain; but Augustulus was spared; and, though stripped of his dignity, was treated with humanity, and allowed a liberal sum for his support and that of his relations. Odoacer was proclaimed king of Italy, but assumed neither the purple nor any other mark of imperial dignity. He was afterwards defeated and slain by Theodoric the Ostrogoth.

ODONTALGIC, in medicine, from Gr. *οδονταλγία*, the tooth ache (*οδον*, a tooth, and *αλγος*, pain) is a term applied to all remedies for the tooth-ache. When the affection is rheumatic, blistering behind the ear, or applying flannel dipped in spirits and covered with ginger or pepper, will generally cure; but, when it proceeds entirely from the injury of a carious tooth, the pain is much more obstinate. In this case it has been recommended to touch the pained carious part of the tooth with a hot iron, or with oil of vitriol, in order to destroy the aching nerve; to hold spirits in the mouth; to put a drop of oil of cloves into the hollow of the tooth, or a pill made of camphor, opium, and oleum caryophylli. Others recommend gum mastich, dissolved in oleum terebinthinæ; others camphor alone, kept in the mouth. The great Boerhaave is said to have applied camphor, opium, oleum caryophylli, and alkohol, upon cotton. The caustic oil which may be collected from writing paper, rolled up tight, and set fire to at the end, will sometimes destroy the exposed nervous substance of a hollow tooth. The application of radix pyrethri, by its power of stimulating the salivary glands, either in substance or in tincture, has also been attended with good effects. But one of the most useful applications of this kind is strong nitrous acid, diluted with three or four times its weight of spirit of wine, and introduced into the hollow of the tooth, either by means of a hair pencil or a little cotton. When the constitution has had some share in the disease, the Peruvian bark has been recommended, and perhaps with much justice, on account of its tonic and antiseptic powers. When the pain is not fixed to one tooth, leeches applied to the gum are of great service. But very often all the foregoing remedies will fail, and the only infallible cure is to draw the tooth.

ODONTOLOGY, in anatomy. See TEETH.

ODOR, *or*ὄσμη, *n. s.*ODORATE, *adj.*

ODORIFEROUS,

ODORIFEROUSNESS, *n. s.*ODOROUS, *adj.*

odorous, yielding scent; usually yielding a sweet or agreeable scent; fragrant: odoriferousness, sweetness of scent; fragrance.

Such fragrant flowers do give most *odorous* smell, But her sweet *odour* did them all excel. *Spenser.*

Me seemed I smelt a garden of sweet flowers, That dainty *odours* from them threw around, For damais sit to deck their lovers' bowers. *Id.*

Smelling is with a communication of the breath, or vapour of the object *odorate*.

Bacon's Natural History.

True virtues, like precious *odours*, are sweeter when incensed and crushed. *Bacon.*

Democritus, when he lay a dying, sent for loaves of new bread, which, having opened and poured a little wine into them, he kept himself alive with the *odour* till a certain fast was past. *Id.*

A bottle of vinegar so buried, came forth more lively and *odoriferous*, smelling almost like a violet. *Id.*

There stood in this room presses that enclosed Robes *odoriferous*. *Chapman.*

Gentle gales,

Fanning their *odoriferous* wings, dispense Native perfumes, and whisper whence they stole These balmy spoils. *Milton's Paradise Lost.*

By her intercession with the king she would lay a most seasonable and popular obligation upon the whole nation, and leave a pleasant *odour* of her grace and favor to the people behind her. *Clarendon.*

They refer savor unto salt, and *odour* unto sulphur; they vary much concerning colour. *Browne.*

Their private roofs on *odorous* timber borne, Such as might palaces for kings adorn. *Waller.*

Smelling bodies send forth effluvia of steams, without sensibly wasting. A grain of musk will send forth *odoriferous* particles for scores of years, without its being spent. *Locke.*

The Levites burned the holy incense in such quantities as refreshed the whole multitude with its *odours*, and filled all the region about them with perfume. *Addison.*

We smell, because parts of the *odorous* body touch the nerves of our nostrils.

Chryse's Philosophical Principles.

Where silver riv'lets play through flowery meads, And woodbines give their sweets, and limes their shades,

Black kennels absent *odours* she regrets, And stops her nose at beds of violets. *Young.*

With vials full of *odours* sweet,

And harps of sweetest sound. *Watts.*

OECOLAMPADIUS (John), a celebrated German reformer, born at Reinspur in Franconia, in 1482. He studied at Heilbrun, and afterwards at Heidelberg, where he took his degree of bachelor in philosophy in his fourteenth year. His reputation induced the elector-palatine to appoint him preceptor to his son. He completed his studies at Tubingen, under Reuchlin; after which he was invited to Basil, and made D.D. At Augsburg he embraced the sentiments of Luther, and published his Confession, which containing doctrines disagreeable to the monks of his convent, he quitted it, and returned to Basil in 1522, where the council appointed him professor of divinity and city preacher. He

Fr. *odour*; Lat. *odor*. Scent; smell; fragrance; perfume. *odorate* is having a strong smell, good or bad: *odoriferous* and

translated St. Chrysostom's Commentaries upon Genesis into Latin. In the dispute between Luther and Zuinglius, respecting the eucharist, he defended the opinions of the latter, in a work which is reckoned well written. In 1528 he married, and completed the reformation of the churches of Basil and Ulm. In 1529 he assisted at the conference at Marspurg; and, returning to Basil, died of the plague in 1531, aged forty-nine. A monument is erected in the cathedral to his memory. He left a son and two daughters. His works are numerous and highly esteemed.

ECONOMICS, *n. s.*

Greek οἰκονομικός.

Household management. See **ECONOMY**.

A prince's leaving his business wholly to his ministers is as dangerous an error in politics as a master's committing all to his servant is in *oeconomicks*. *L'Estrange.*

OECONOMISTS, a sect of philosophers in France, the founder of which was Dr. Duquesnai, who had so well insinuated himself into the favor of Louis XV. that he used to call him his thinker. They were styled Oeconomists because the economy and order to be introduced into the finances, and other plans of alleviating the distresses of the people, were their constant topics. Under pretence of ameliorating the condition of the people, and instructing them, they drew several of the king's best friends in, to patronise their society and their ostensible measures; but in the mean time held private and secret meetings with all whom they could trust, at baron Holbach's; where they prepared and revised tracts for publication; in some of which they disguised their sentiments, but in others were so bold as to publish under such titles as Christianity Unmasked! &c. Their principal members were Messrs. D'Alembert, Turgot, Condorcet, Diderot, La Harpe, and La Moignon, keeper of the seals.

ECUMENICAL, *adj.* Gr. οἰκουμένης. General; universal: applied in particular to certain ecclesiastical councils.

This Nicene council was not received as an *oecumenical* council in any of the eastern patriarchates, excepting only that of Constantinople.

Stillingfleet.

We must not make a computation of the Catholic church from that part of it which was within the compass of the Roman empire, though called *ecumenical*. *Lesley.*

OECUMENIUS, a Greek author who flourished in the middle of the tenth century, and wrote a paraphrase of some of the books of the New Testament in Greek. His works were printed, along with those of Aretas, in 1631, in 2 vols. folio.

CEDEMA, *n. s.*

From Gr. οἰδημα, οἰδω, **CEDEMAT'IC**, *adj.* } to swell. A particular kind

CEDEMATOUS. } of swelling. See the instances.

It is primarily generated out of the effusion of melancholick blood, or secondarily out of the dregs and remainder of a phlegmonous or *oedematich* tumour. *Harvey.*

The great discharge of matter, and the extremity of pain, wasted her, *oedematous* swellings arose in her legs, and she languished and died. *Wiseman.*

An **CEDEMA**, or phlegmatic tumor, in medicine and surgery, is a tumor attended with paleness and cold, yielding little resistance, retaining

the print of the finger when pressed with it, and accompanied with little or no pain. It has no certain situation in any particular part of the body, since the head, eye-lids, hands, and sometimes part, sometimes the whole, body is afflicted with it. When this last is the case, the patient is said to be troubled with a cachexy, leucophlegmatia, or dropsy. See *MEDICINE*.

OEDENBURG, or Soprony-Varmegye, a palatinate of Hungary, adjacent to Austria, the lake of Neusiedl, and the river Raab. Its area is 1300 square miles. Towards the east it is flat, but the rest is intersected by ranges of mountains, so that it affords a great variety of soil. Its climate is, however, mild; and it produces much rye, wheat, and fruits. Near the capital, and in the vicinity of Rust, is produced a red wine, in great request. The mineral products are coal and lime, which are both exported. Population 165,000, composed of a mixed race, of German and Magyar descent, with Croats, and some Jews.

OEDENBURG, or Soprony (the Roman Sopronium), the capital of the palatinate of this name, stands in a pleasant district, between Hungary and Austria Proper, and is neatly built. It has one Lutheran and two Catholic churches, a cathedral chapter, a Catholic and Lutheran gymnasium, and is almost the only place in Hungary that has a manufacture of fine woollen. It possesses also a sugar refinery, and manufactures of glass and potash. But Oedenburgh derives its chief importance from its markets for corn and cattle. The number yearly sold is 40,000 head of cattle, and 80,000 hogs. Of the latter a large proportion are driven from the frontiers of Turkey. Inhabitants 12,500, partly of Hungarian, partly of German descent. Thirty-seven miles S. E. of Vienna.

OEDER (George Louis), an eminent German physician and botanist, born at Anspach in 1728, studied at Gottingen under Haller. Having practised as a physician, at Sleswick, he was in 1752 invited to the botanical chair at Copenhagen. The first part of his *Flora Danica* appeared in 1763. He also published, in 1769, a *Memoir on the Civil and Political State of the Peasantry*. Count Bernstorff consulted him; and under Struensee he was appointed counselor of finance, and president of the council of revenues for Norway. On the fall of that minister he removed from Copenhagen, and was made bailli of the duchy of Oldenburgh, where he established a fund for the benefit of widows. He died the 28th of October, 1791. Besides the works referred to, he published *Elementa Botanica*, 1762—64, 2 vols. 8vo.; *Nomenclator Botanicus*, 1769, 8vo.; *Figures of Plants growing spontaneously in Denmark and Norway*, 1766, folio; *Observations on a Bank for Widows*, Copenhagen, 1771, 8vo.; and many memoirs in periodical journals. Linnæus, in honor of this botanist, gave the name of *Oedera* to a genus of plants of the Cape of Good Hope.

OEDERA, in botany, a genus of the polygamia segregata order, and syngenesia class of plants; *cal.* are multiflorous: the *cor.* tubular, hermaphrodite, and one or two feminine ones ligulate; the receptacle is chaffy; the pappus with numerous chaff.

ÆDIPUS, in fabulous history, a son of *Laius*, king of Thebes, and *Jocasta*. *Laius*, the father of *Ædipus*, was informed by the oracle, as soon as he married *Jocasta*, that he must perish by the hands of his son. This dreadful intelligence awakened his fears, and, to prevent the fulfilling of the oracle, he resolved never to approach *Jocasta*; but his resolutions were violated in a fit of intoxication. The queen became pregnant, and *Laius* ordered his wife to destroy her child as soon as born. The mother did not obey, yet she gave the child to one of her domestics, with orders to expose him in the mountains. The servants bored the feet of the child, and suspended him with a twig, by the heels, to a tree on mount *Cithæron*, where he was soon found by one of the shepherds of *Polybus*, named *Phorbas*, king of Corinth. The shepherd carried him home, and *Peribæa*, the wife of *Polybus*, who had no children, educated him as her own child. The accomplishments of the infant, who was named *Ædipus* on account of the swelling of his feet (*oidein*, to swell, and *ποδες*, the feet), soon became the admiration of the age. His companions envied him, and one of them told him that he was an illegitimate child. On this he went to consult the oracle of Delphi, and was there told not to return home; for if he did he must necessarily be the murderer of his father, and the husband of his mother. This answer terrified him; he knew no home but the house of *Polybus*, and therefore resolved not to return to Corinth. He travelled towards *Phocis*, and, in his journey, met in a narrow road *Laius* on a chariot with his armor-bearer. *Laius* ordered *Ædipus* to make way for him. *Ædipus* refused, and a contest ensued, in which *Laius* and his armor-bearer were both killed. *Ædipus*, ignorant of the rank of the men whom he had killed, continued his journey, and was attracted to Thebes by the fame of the *Sphinx*, whose cruelty had become an object of public concern; and, as the successful explanation of an enigma would end in the death of the *Sphinx*, *Creon*, who at the death of *Laius* had ascended the throne of Thebes, promised his crown and *Jocasta* to him who succeeded in the attempt. The enigma proposed was this:—What animal in the morning walks upon four feet, at noon upon two, and in the evening upon three? This was left for *Ædipus* to explain, and he said to the monster that man, in the morning of life, walks upon his hands and his feet; when he has attained the years of manhood, he walks upon his two legs; and in the evening he supports his old age with the assistance of a staff. The monster, mortified at the true explanation, dashed his head against a rock and perished. *Ædipus* then married *Jocasta*, by whom he had two children, *Eteocles* and *Polynices*. An enquiry at length into the death of *Laius* disclosed to him the parricide and incest of which he had been unintentionally guilty. Struck with horror at the unintentional criminality in which he had been involved, he tore out his eyes, as unworthy to behold the light, and taking sanctuary in the grove of the furies in Attica, there ended his miserable life. *Jocasta* also put an end to her life, and, to complete the tragedy, their sons were distinguished by the inveteracy of their

mutual hatred. The death of *Edipus* is placed by chronologists about the year 1228 B. C.

OELAND, is a long narrow island of the Baltic, separated from the coast of East Gothland by the Strait of Calmar, from two to three leagues broad. The east coast of the island is bold and clean, but the west is lined with dangers. An elevated ridge, called *Alwar*, runs through its whole length, which is twenty-five leagues, and its breadth only one and a half to two. The base of the island is a calcareous reddish stone with green and gray veins, besides which it possesses aluminous schistus, free-stone, blocks of granite, porphyry, rock crystal, and a great quantity of petrified shells, and coralligenous substances. All the elevated ground is stony and barren, producing only a scanty pasture for sheep. The rivulets which descend from these elevations fertilise their declivities as well as the border of level ground towards the sea, where are produced the oak, beech, hazle, and walnut, besides pasture for a considerable number of horses, horned cattle, and sheep. The horses are very small but active and hardy. The island has some wild deer and boars. The population, in 1800, was 22,605 souls, whose chief industry, besides raising cattle, is cutting building-stone, burning lime, and drawing the aluminous schistus from the mines, all of which are sent to the continent. There is no town on the island, but *Borgholm* is an ancient and royal castle on the west, surrounded with round towers at the angles, and high walls, without which is a village.

The southern channel into the strait of Calmar is between the island of Oeland and a group of rocks called the *Utlippers* or *Out-lookers*; between these latter and the main there is no ship channel, the space being filled with rocks. Nearly in the middle of the strait, towards its northern extremity, is an insular rock almost perpendicular, 230 feet high, and surrounded by reefs. In its crevices grow some oaks, beeches, and birch, and its only inhabitants are wild goats and sea-birds. Its proper name in Swedish is *Blokulla*, or the Blue Mountain, but, as it is celebrated in the popular tales of the country as the resort of sorcerers, the superstitious seamen, believing this a name of ill omen, call it the *Virgin's Mountain*.

OELL'AD, n. s. Fr. *ocillade*, *oeil*. A glance; wink.

She gave *ocillads* and most speaking looks
To noble Edmund. *Shakespeare. King Lear.*

OELS, a principality of Silesia, now part of the government of Breslau, belonging to the duke of Brunswick. It has an area of 740 square miles, with 85,000 inhabitants, and is said to yield an income of £15,000 a year.

OELS, a town of Prussian Silesia, the capital of the above principality, is situated on a small river of the same name, sixteen miles E. N. E. of Breslau. It is surrounded with walls, has a palace where the prince formerly resided, one Catholic and five Protestant churches, a free-school, public library, and museum of natural history. Population 3800.

OENANTHE, water dropwort, a genus of the digynia order and pentandria class of plants;

natural order forty-fifth, umbellatæ. The florets are difform; those of the disc sessile and barren; the fruit crowned with the calyx. There are five species; of which the most remarkable is the

O. crocata, or hemlock drop-wort, growing frequently on the banks of ditches, rivers, and lakes, in many parts of Britain. The root and leaves are strong poison; several persons have perished by eating it, through mistake, for water parsnips or for celery, which last it resembles pretty much in its leaves. Lobel calls this plant *enanthe aquatica cicutæ facie*. It grows in great plenty all over Pembroke-shire, and is called by the inhabitants five-fingered root: it is much used by them in cataplasms, for the felon or worst kind of whitlow. They eat some parts of it, but carefully avoid the roots and stalk. These indeed are most pernicious, and prove instantly fatal, unless a proper remedy is applied. This plant is so extremely like celery, and so apt to be mistaken for it, that it cannot be enough guarded against.

Mr. Howard, a surgeon, at Haverford West, relates the case of eleven French prisoners who had the liberty of walking in and about the town of Pembroke. Three of them, being in the fields a little before noon, dug up a large quantity of this plant, which they took to be wild celery, to eat with their bread and butter for dinner. After washing it they all three ate, or rather tasted of the roots. As they were entering the town, without any previous notice of sickness at the stomach, or disorder in the head, one of them was seized with convulsions. The other two ran home, and sent a surgeon to him. The surgeon endeavoured first to bleed and then to vomit him; but those endeavours were fruitless, and he died presently. Ignorant of the cause of their comrade's death, and of their own danger, they gave of these roots to the other eight prisoners, who ate of them with their dinner. A few minutes afterwards the remaining two who gathered the plants were seized in the same manner as the first, of which one died; the other was bled, and a vomit with great difficulty forced down, on account of his jaws being as it were locked together. This operated, and he recovered, but was some time affected with dizziness in his head, though not sick, or the least disordered in his stomach. The other eight, being bled and vomited immediately, were soon well. Stanpaart Vander Wiel mentions two cases of five fatal effects of eating the poisonous root, both of which were attended with great heat in the throat and stomach, sickness, vertigo, and purging; they both died in the course of two or three hours after eating the root. The Dutch physicians make mention of similar mischief from the use of the same root; and Sir W. Watson cites an instance of a person who was poisoned by eating the leaves of the plant boiled in pottage. Most brute animals are equally affected by this poison with man.

OENEUS, in fabulous history, a king of Caledonia in Ætolia, son of Parthaon, grandson of Neptune, and father of MELEAGER, TYDEUS DEJANIRA, &c. See these articles. He was driven from his throne by the sons of his brother

Agrius, but restored by his grandson **Diomedes**, and died at **Oene**.

OENOMAUUS, in fabulous history, the son of **Mars**, by **Stérope**, the daughter of **Atlas** and father of **Hippodamia**, the wife of **Pelops**. See **PELOPS**.

OENONE, a nymph of **Mount Ida**, daughter of the river **Cebrenus**, and wife of **Paris**, before he was known to be the son of king **Priam**. Being endued with the spirit of prophecy, she foretold to him that his voyage to **Greece** would be attended with the ruin of his family and country; and that he would return to her for aid at the hour of his death; all which happened, and **Oenone** killed herself on his body. See **PARIS**.

OENOPTÆ, in Grecian antiquity, a kind of censors at **Athens**, who regulated entertainments.

OENOS, from *Οἶνος*, vinum, wine, in ornithology, a name given to the stock-dove, or wood-pigeon, called also by some vinago, from its wine color; somewhat larger than the common pigeon, but of the same shape and general color. Its neck is of a fine changeable hue, as differently opposed to the light; and its breast, shoulders, and wings, are of a fine purplish hue, or red wine color. Its legs are red, and feathered a little below the joint. See **COLUMBA**.

OENOTHERA, tree primrose, a genus of the monogynia order, and octandria class of plants; natural order seventeenth calycanthemæ: CAL. is quadrid; the petals four: the CAPS. cylindric beneath; the seeds naked. There are seven species; the most remarkable are these:—

1. *O. biennis*, the common biennial tree primrose, has a long, thick, deeply striking root; crowned with many large, oval, spear-shaped, plane, spreading leaves; upright, thick, firm, rough, hairy stems, rising three or four feet high; garnished with long, narrow, lanceolate, close-sitting leaves, irregularly; and at all the axillas, from the middle upwards, large bright yellow flowers.

2. *O. fruticosa*, the shrubby, narrow-leaved, perennial tree-primrose, has long thick roots; upright under-shrubby like red stems, two or three feet high: spear-shaped, lightly indented leaves; and at the axillas pedunculated clusters of yellow flowers, succeeded by pedicellated, acute-angled capsules.

3. *O. octovalvis*, the eight-valved, smooth, biennial tree primrose, has upright, firm, somewhat hairy stems, rising a yard high; oblong, spear-shaped, pointed, plane, smooth leaves; and at the axillas large bright yellow flowers.

4. *O. pumila*, the low perennial tree primrose, has fibrous roots, crowned with many oval, spear-shaped, close-sitting leaves; slender herbaceous stems from ten to twelve inches long; garnished with spear-shaped, blunt, smooth leaves, having very short foot-stalks; and at the axillas smallish bright yellow flowers, succeeded by acute angled capsules. All these plants flower very profusely in June and July, coming out almost half the length of the stalks from the axillas; and, as the stalk advances in stature, new flowers are produced, succeeding those below; in which order the plants continue flowering from about Midsummer till October: each flower is moderately large and conspicuous, con-

sisting of four plane petals, which with the calyx form a very long tube below, and spreading above, generally expand most towards the evening; and are succeeded by plenty of seed in autumn. These plants, though exotics from **America**, are all very hardy, prosper in any common soil and situation, and have been long in the **English** gardens, especially the three first sorts; but the *œnothera biennis* is the most commonly known. They are proper to be employed as plants of ornament for embellishing the pleasure garden; they may be placed any where, and will effect a very agreeable variety three or four months with their plentiful blow of flowers. The biennial kinds must be raised annually from seed, for they totally perish after they have flowered. But the perennials, once raised, continue for years by the root.

OENOTRI, the people of **Oenotria**. These **Oenotrians** were called aborigines; and, after they had been engaged for many years in a war with the **Siculi**, entered into an alliance with a colony of the **Pelasgi**, who came from **Thessaly** into **Italy**, after having been driven from the former country.

OENOTRIA, an ancient name of **Italy**; so called from the **Oenotri** (**Virgil**); who inhabited between **Pæstum** and **Tarentum** (**Ovid**), originally **Arcadians** (**Dionysius Halicarnassæus**), who came under the conduct of **Oenotrus**, son of **Lycæon**, seventeen generations before the war of **Troy**, or 459 years, at twenty-seven years each generation, and gave name to the people. **Cato** derives the name from **Oenotrus**, king of the **Sabines** and **Etruscans**; but **Varro** from a king of the **Latins** of the same name, and **Servius** from the **Greek** name for wine, for which **Italy** was famous; of which opinion also is **Strabo**.

O'ER. Contracted from over. See **OVER**.

OESËL, an island of the **Baltic**, belonging to **Russia**, at the mouth of the gulf of **Riga**. Its length is about seventy miles; its breadth various, being at one place above fifty, and at another not above two or three miles: its area is 1144 square miles. It contains the small town of **Arensberg**, the chief place of a circle in the government of **Riga**. **Oesel** is in general level, but the soil is poor: when manured, however, it produces wheat, rye, barley, and in good seasons oats and peas. The forests are also extensive, and the stone quarries fine. Many blocks have been extracted from them for statuary. The fisheries on the coast are also productive. Population, including the small adjoining islands of **Moen** and **Runoe**, 35,000.

OESOPH'AGUS, *n. s.* Of *Gr.* *οἶσος*, wicker, and *φαγω*, to eat. (From the basket-like texture of the part). The gullet.

Both run by one another, till at the ninth the *œsophagus* turns again to the left, pierces the midriff, and is continued to the left orifice of the stomach.

Quincy.

Wounds penetrating the *œsophagus*, and *aspera arteria*, require to be stitched close, especially those of the *œsophagus*, where the sustenance and saliva so continually presseth into it. *Wiseman's Surgery.*

OESOPHAGUS. See **ANATOMY**.

OESTRUS, in entomology, a genus of insects belonging to the order of **diptera**. It has no

mouth; but three punctures, without trunk or beak: antennæ taper, proceeding from a lenticular joint. This is one of the most curious genera of insects. They are distinguished into several species, named from the different places wherein they deposit their eggs. Some, knowing that their eggs cannot be hatched but under the skins of living creatures, such as bulls, cows, reindeer, stags, and camels, fix upon them at the instant of laying their eggs. From the hinder part of their body issues a whimble of wonderful structure. It is a scaly cylinder, composed of four tubes, which draw out like the pieces of a spying-glass; the last is armed with three hooks, and is the gimblet with which the œstri bore through the tough hide of horned cattle. The animal seems to experience no pain from the puncture, unless the insect, plunging too deep, attacks some nervous fibre; in which case the beast runs about, and becomes furious. The eggs being hatched, the grub feeds on the matter of the wound. The place of its abode forms upon the body of the quadrupeds a bunch sometimes above an inch high. When full grown, the larva breaks through the tumor, and slides down to the ground, in the cool of the morning, that it may neither be overpowered by the heat of the day, nor chilled by the cold of the night: it then digs itself a burrow, into which it retires. Its skin grows hard, and turns to a very solid shell. There it is transformed to a chrysalis, and afterwards to a winged insect. The shell wherein the œstrus is enclosed is of so strong a texture, that it could not make its way out, if at one of the ends there were not a small valve, fastened only by a very slight filament. The first push the œstrus makes, the door gives way, the prison opens, and the insect wings its way to woods and places frequented by cattle. See ENTOMOLOGY.

OETA, in ancient geography, a mountain of Thessaly, extending from Thermopylæ west to the Sinus Ambracius, and crossing at right angles the mountainous country stretching out between Parnassus on the south and Pindus on the north. At Thermopylæ it is very rough and high, rising and ending in sharp and steep rocks, affording a narrow passage between it and the sea from Thessaly to Locris (Strabo), with two paths over it; the one above Trachis, very steep and high; the other through the country of the *Enianes*, much easier and readier for travellers: by this it was that Leonidas was attacked in rear by the Persians. (Pausanias.) Here Hercules laid himself on the funeral pile (Silius Italicus, Ovid); the spot thence called Pyra, according to Livy, who says, that the extreme mountains to the east are called Oeta; and hence the poets allege that day, night, sun, and stars arose from Oeta (Seneca, Silius Italicus, Catullus, Virgil's Culex): circumstances which show the height of this mountain. It is now called Banina.

OF, *prep.* Sax. *of.* Isl. *of.* Concerning; relating or belonging to; from; among; by or produced by; according to: denoting power; causality; ability; choice; qualities or properties; composition; extraction; adherence; motive; form or manner; proportion: 'of late' seems to mean 'in late time;' 'of old,' 'in old time.'

It was called *Corcyra of Corcyra* the daughter of *Æopua*. *Sandys's Travels.*

I was friendly entertained of the English consul. *Sandys.*

The captain of the Helots, with a blow whose violence grew of fury, not of strength, or of strength proceeding of fury, struck Palladius upon the side of the head. *Sidney.*

As if our Lord, even of purpose to prevent this fancy of extemporal and voluntary prayers, had not left, of his own framing, one which might remain as a part of the church liturgy, and serve as a pattern whereby to frame all other prayers with efficacy, yet without superfluity of words. *Hooker.*

I cannot instantly raise up the gross

Of full three thousand ducats. *Shakspeare.*

He borrowed a box of the ear of the Englishman, and swore he would pay him again when he was able. *Id.*

Your Highness shall repose you at the Tower.

—I do not like the Tower of any place. *Id.*

Tubal, a wealthy Hebrew of my tribe, Will furnish me. *Id. Merchant of Venice.*

The chariot was all of cedar, gilt and adorned with crystal, save that the fore-end had pannels of sapphires set in borders of gold, and the hinder end the like of emeralds of the Peru colour. *Bacon.*

Like heaven in all, like earth in this alone, That tho' great states by her support do stand, Yet she herself supported is of none, But by the finger of the Almighty's hand. *Davies.*

The senate

And people of Rome, of their accustomed greatness, Will sharply and severely vindicate Not only any fact, but any practice 'Gainst the state. *Ben Jonson's Catiline.*

The quarrel is not now of fame and tribute, Or of wrongs done unto confederates, But for your own republic. *Ben Jonson.*

The most renowned of all are those to whom the name is given Philippinæ. *Abbot.*

He was a man of a decayed fortune, and of no good education. *Clarendon.*

O miserable of happy! is this the end Of this new glorious world, and me so late The glory of that glory, who now become Accursed, of blessed! *Milton's Paradise Lost.*

The Venice glasses would crack of themselves. *Boyle.*

Of late, divers learned men have adopted the three hypostatical principles. *Id. on Colours.*

They do of right belong to you, being most of them first preached amongst you. *Tillotson.*

All men naturally fly to God in extremity, and the most atheistical person in the world, when forsaken of all hopes of any other relief, is forced to acknowledge him. *Id.*

Of himself is none, But that eternal infinite and one, Who never did begin, who ne'er can end; On him all beings, as their source, depend. *Dryden.*

He, to his natural endowments of a large invention, a ripe judgment, and a strong memory, has joined the knowledge of the liberal arts. *Id.*

Our sovereign Lord has pondered in his mind The means to spare the blood of gentle kind; And, of his grace and inborn clemency, He modifies his first severe decree. *Id.*

Tancred, whose delight

Was placed in his fair daughter's daily sight, Of custom, when his state affairs were done, Would pass his pleasing hours with her alone. *Id.*

In days of old there lived, of mighty fame,
A valiant prince, and Theseus was his name. *Id.*

Mother, says the thrush, never had any such a
friend as I have of this swallow. No, says she, nor
ever mother such a fool as I have of this same thrush.

L'Estrange.

The rousing of the mind with some degrees of
vigour, does set it free from those idle companions.

Locke.

How many are there of an hundred, even amongst
scholars themselves? *Id.*

This cannot be understood of the first disposition
of the waters, as they were before the flood.

Burnet.

Peace, of all worldly blessings, is the most valuable.

Smallridge.

No particle of matter, nor any combination of
particles; that is, no bodies can either move of
themselves, or of themselves alter the direction of
their motion. *Cheyne.*

We are not to describe our shepherds as shepherds
at this day really are, but as they may be conceived
then to have been, when the best of men followed
the employment. *Pope.*

To cultivate the advantages of success, is an affair
of the cabinet; and the neglect of this success may
be of the most fatal consequence to a nation.

Swift.

Howe'er it was civil in angel or elf,
For he'er could have filled it so well of himself. *Id.*

The common materials which the ancients made
their ships of, were the wild-ash, the ever-green oak,
the beech, and the alder. *Arbuthnot on Coins.*

While heard from dale to dale,

Waking the breeze resounds the blended voice
Of happy labor, love, and social glee. *Thomson.*

This truth at least let Satire's self allow,
No dearth of bards can be complained of now:
The loaded press beneath the labor groans,
And printers' devils shake their weary bones.

Byron.

It is with men of their wit as with women of
their beauty. Tell a woman she is fair, and she will
not be offended that you tell her she is cruel.

Canning.

OFF, *adv., prep., & interj.* } Sax. *of*; Goth.,
OFF'ING, *n. s.* } Mæz. Goth., Teut.,
Belg., Dan., and Isl. *af*; Lat. *ab*. From; out
of; opposed to *on*; and denoting generally dis-
junction; separation; breach of continuity,
agreement, or promise; absence; distance; dis-
appointment; opposition. 'Off-hand,' means
unstudied; quickly performed: 'to come off,'
to escape or recede from a contract by accident
or subterfuge: 'to get off' is to escape: 'to go
off' desert or abandon; take fire and be dis-
charged: 'off' also signifies a state of being,
separately considered, as 'he is well or ill off'
means he is in a good or bad state or condition:
as an interjection, off commands away, or to de-
part; and expresses disgust or abhorrence.

Philoclea, whose delight of hearing and seeing
was before a stay from interrupting her, gave herself
to be seen unto her with such a lightening of beauty
upon Zelmane, that neither she could look on, nor
would look off. *Sidney.*

Since the wisdom of their choice is rather to have
my cap than my heart, I will practise the insinuating
nod, and be off to them most counterfeitedly.

Shakespeare. Coriolanus.

Where are you, Sir John? come, off with your
boots. *Shakespeare.*

West of this forest, scarcely off a mile,
In goodly form comes on the enemy. *Id.*
About thirty paces off were placed harquebusiers.
Knolles.

I continued feeling again the same pain; and
finding it grow violent I burnt it, and felt no more
after the third time; was never off my legs, nor kept
my chamber a day. *Temple.*

See

The lurking gold upon the fatal tree; .
Then rend it off. *Dryden.*

Several starts of fancy off hand look well enough.
L'Estrange.

Competitions intermit, and go off and on as it
happens, upon this or that occasion. *Id.*

A piece of silver coined for a shilling, that has
half the silver clipped off, is no more a shilling than
a piece of wood which was once a sealed yard is still
a yard, when one half of it is broke off. *Locke.*

The questions no way touch upon puritanism,
either off or on. *Sanderson.*

Cicero's Tusculum was at a place called Grotto
Ferrate, about two miles off this town, though most
of the modern writers have fixed it to Freccati.

Addison on Italy.

Truth, guide some genuine bard, and aid his hand
To drive this pestilence from off the land. *Byron.*

OFFA, or UFFA, an Anglo-Saxon monarch,
king of Mercia, who succeeded Ethelbald, A.D.
755. He treacherously murdered Ethelbert,
king of the East Angles, and took possession of
his kingdom. As an atonement he gave the tenth
of his goods to the poor, went on a pilgrimage
to Rome, instituted the tax called Peter pence,
and built the monastery at St. Albans. He also
erected the wall which bears his name. See
ENGLAND. He died in 794.

OFFAL, *n. s.* Belgic *afal*. Off and fall,
i. e. that which falls off, or is refuse; waste, par-
ticularly waste or refuse food; coarse flesh; car-
rion; any refuse.

What trash is Rome! what rubbish and what
offal! *Shakespeare.*

I should have fatted all the region kites
With this slave's offal. *Id. Hamlet.*

If we come into a barn floor and see some few
grains scattered amongst a heap of chaff, we do not
call it a corn heap, the quantity of the offal devours
the mention of those insensible grains. *Hall.*

Cramm'd, and gorg'd, nigh burst

With suck'd and glutted offal.

Milton's Paradise Lost.

If a man bemoan his lot,
That after death his mould'ring limbs shall rot,
A secret sting remains within his mind;
The fool is to his own cast offals kind. *Dryden.*

To have right to deal in things sacred was ac-
counted an argument of a noble and illustrious de-
scendant; God would not accept the offals of other
professions. *South.*

He let out the offals of his meat to interest, and
kept a register of such debtors in his pocket-book.

Arbuthnot.

They commonly fat hogs with offal corn.

Mortimer.

OFFENBACH, a mean town of Germany, in
the grand duchy of Hesse-Darmstadt, the chief
place of the principality of Isenburg-Birstein.
It is partly walled and divided into the Old,
the New, and the French district. It has three Pro-
testant churches, a synagogue, a ducal palace,
and 8000 inhabitants. This is the only manu-

facturing town in the duchy, and is noted for its sauff and tobacco, wax, japanned goods, musical instruments, carriages, and trinkets. The printing of books is also carried on extensively; and the wine produced in the vicinity forms a good article of traffic. It stands on the Maine, four miles E. S. E. of Frankfort.

OFFENCE', *n. s.*

OFFENCE'FUL, *adj.*

OFFENCE'LESS, *adj.*

OFFEND', *v. a. & v. n.*

OFFEN'DER, *n. s.*

OFFEN'DRESS, *n. s.*

OFFEN'SIVE, *adj.*

OFFEN'SIVELY, *adv.*

OFFEN'SIVENESS, *n. s.*

Fr. offence; Latin

offendo. Crime; vice;

transgression; injury;

attack; act of wicked-

ness, or causing injury

or disgust; the disgust

caused; displeasure or

anger: offenceful is,

disgustful; displeas-

ing; injurious: offenceless, harmless; unoffending: to offend, to transgress; violate rules; make angry; disgust; displease; attack; injure: as a neuter verb, be criminal; cause anger; commit transgression or sin (taking *against* after it): an offender is a criminal, he who has committed a crime or an injury; offendress, an unusual feminine noun of the same signification: offensive is causing anger or displeasure; pain or injury; assailable; not defensive: offensively and offensiveness follow these senses.

All that watch for iniquity are cut off, that make a man an offender for a word. *Isa. xxix. 21.*

Giving no offence in any thing, that the ministry be not blamed. *2 Cor. vi. 3.*

Whosoever shall keep the whole law, and yet offend in one point, he is guilty of all. *James ii.*

I am young and unkonning as thou wast, and, as I trow, with love offended most of any living creature. *Chaucer.*

He was fain to defend himself, and withal so to offend him, that by an unlucky blow the poor Philoxenus fell dead at his feet. *Sidney.*

Earnest in every present humour, and making himself brave in his liking, he was content to give them just cause of offence when they had power to make just revenge. *Id.*

Courtesy, that seemed incorporated in his heart, would not be persuaded to offer any offence, but only to stand upon the best defensive guard. *Id.*

It shall suffice to touch such customs of the Irish as seem offensive and repugnant to good government. *Spenser.*

Since no man can do ill with a good conscience, the consolation which we herein seem to find is but a meer deceitful pleasing of ourselves in error, which must needs turn to our greater grief, if that which we do to please God most, be for the manifold effects thereof offensive unto him. *Hooker.*

In the least thing done offensively against the good of men, whose benefit we ought to seek for as our own, we plainly shew that we do not acknowledge God to be such as indeed he is. *Id.*

The emperor himself came running to the place in his armour, severely reproving them of cowardice who had forsaken the place, and grievously offended with them who had kept such negligent watch. *Knolles' History of the Turks.*

Thou hast stolen that which after some few hours Were thine without offence. *Shakespeare. Henry IV.*

It seems your most offenceful act

Was mutually committed. *Shakespeare.*

You are but now cast in his mood, a punishment more in policy than in malice; even so as one would beat his offenceless dog to affright an imperious lion. *Id. Othello.*

If much you note him

You shall offend him, and extend his passion.

Feed and regard him not. *Id. Macbeth.*

All vengeance comes too short

Which can pursue the offender. *Shakespeare.*

Virginity murders itself, and should be buried in highways out of all sanctified limit, as a desperate offendress against nature. *Id.*

The pleasures of the touch are greater than those of the other senses; as in warming upon cold, or refrigeration upon heat: for, as the pains of the touch are greater than the offences of other senses, so likewise are the pleasures. *Bacon.*

It is an excellent opener for the liver, but offensive to the stomach. *Id. Natural History.*

Thither with speed their hasty course they plyed, Where Christ the Lord for our offences died. *Fairfax.*

So like a fly the poor offender dies;

But, like the wasp, the rich escapes and flies.

We enquire concerning the advantages and disadvantages betwixt those military offensive engines used among the ancients, and those of these latter ages. *Wilkins.*

A lady had her sight disordered, so that the images in her hangings did appear to her, if the room were not extraordinarily darkened, embellished with several offensively vivid colours. *Boyle.*

Cheaply you sin, and punish crimes with ease, Not as the' offended, but the offenders please. *Dryden.*

I have given my opinion against the authority of two great men, but I hope without offence to their memories; for I loved them living, and reverence them dead. *Id.*

If, by the law of nature, every man hath not a power to punish offences against it, I see not how the magistrates of any community can punish an alien of another country. *Locke.*

The muscles of the body being preserved sound and limber upon the bones, all the motions of the parts might be explicated with the greatest ease and without any offensiveness. *Grew's Museum.*

The bishops therefore of the church of England did no ways offend by receiving from the Roman church into our divine service, such materials, circumstances, or ceremonies, as were religious and good. *Whita.*

By great and scandalous offences, by incorrigible misdemeanours, we may incur the censure of the church. *Pearson.*

Gross sins are plainly seen, and easily avoided, by persons that profess religion. But the indiscreet and dangerous use of innocent and lawful things, as it does not shock and offend our consciences, so it is difficult to make people at all sensible of the danger of it. *Law.*

The conscience of the offender shall be sharper than an avenger's sword. *Clarissa.*

Some particular acrimony in the stomach sometimes makes it offensive, and which custom at last will overcome. *Arbutnot.*

How shall I lose the sin yet keep the sense, And love the' offender, yet detest the offence? *Pope.*

Our language is extremely imperfect, and in many instances it offends against every part of grammar. *Swin.*

The watchful guests still hint the last offence, The daughter's petulance, the son's expence, Improve his heady rage with treacherous skill, And mould his passions till they make his will. *Johnson.*

Conscience is a great ledger book in which all our

offences are written and registered, and which time reveals to the sense and feeling of the *offender*.

Sheridan.

OFFER, *v. a., v. n., & n. s.*
OFFERER, *n. s.*
OFFERING,
OFFERTORY,
OFFERTURE.

Fr. offrir, offre;
Lat. offero. To
present; exhibit
any thing with
a view to its

being taken: hence to give, and to attempt or propose any thing; to sacrifice; immolate; devote; or present, as an act of worship (taking up emphatically): to bid; propose as a price or reward: as a neuter verb, to be present or at hand; to present itself; make an attempt (taking at): an offer is, an advance; a proposal; attempt or endeavour; price bid; tribute or acknowledgment: an offerer, he who in any of the foregoing senses offers: offering, the thing or subject matter offered: offertory, the act of offering: offerture, an old synonyme of offer; overtur.

Which hath not nede ech dai, as preestis firste for hisse owne gyltis to *offre* sacrifices, and afterwarde for the peple, for he dide this thyng in *offryng* himself conys.

Wiclif.

They *offered* unto the Lord, of the spoil which they had brought, seven hundred oxen.

2 Chronicles.

When thou shalt make his soul an *offering* for sin, he shall see his seed.

Isaiah liii. 10.

Lysimachus armed about three thousand men, and began first to *offer* violence.

2 Mac. iv. 40.

But trewly to tellen atte last,
He was in chirche a noble ecclesiast;
Wel coude he rede a lesson or a storie,
But alder best he sang an *offertorie*. *Chaucer.*

In all the parish wif ne was ther non,
That to the *offering* before hir shulde gone;
And, if thei did, certain so wroth was she,
That she was out of alle charitee. *Id.*

No thought can imagine a greater heart to see and contemn danger, where danger would *offer* to make any wrongful threatening upon him. *Sidney.*

Fair streams that do vouchsafe in your clearness to represent unto me my blubbered face, let the tribute *offer* of my tears procure your stay awhile with me, that I may begin yet at last to find something that pities me. *Id.*

If the mind of the *offerer* be good, this is the only thing God respecteth. *Hooker.*

Force compels this *offer*.

And it proceeds from policy, not love
—Mowbray, you overween to take it so;
'This *offer* comes from mercy, not from fear.

Shakspeare.

Plucking the entrails of an *offering* forth,
They could not find a heart within the beast. *Id.*

Many motions, though they be unprofitable to expel that which hurteth, yet they are *offers* of nature, and cause motions by consent; as in groaning, or crying upon pain. *Bacon.*

We came close to the shore, and *offered* to land. *Id.*

He went into St. Paul's church, where he made *offertory* of his standards, and had orisons and Te Deums sung. *Id.*

Thou hast prevented us with *offertures* of thy love, even when we were thine enemies.

King Charles.

One *offers*, and in *offering* makes a stay;
Another forward sets, and doth no more. *Daniel.*
I hope they will take it well that I should *offer* at a new thing, and could forbear presuming to meddle

where any of the learned pens have ever touched before.

Cromart.

The administration of the sacrament he reduced to an imitation, though a distant one, of primitive frequency, to once a month, and therewith its anciently inseparable appendant, the *offertory*. *Fell.*

Nor, shouldst thou *offer* all thy little store,
Will rich Iolas yield, but *offer* more. *Dryden.*

Whole herds of *offered* bulls about the fire,
And bristled boars and woolly sheep expire. *Id.*
I would treat the pope and his cardinals roughly,
if they *offered* to see my wife without my leave. *Id.*

The gloomy god

Stood mute with awe, to see the golden red;
Admired the destined *offering* to his queen,
A venerable gift so rarely seen. *Id.*

Write down and make signs to him to pronounce them, and guide him by shewing him by the motion of your own lips to *offer* at one of those letters; which being the easiest, he will stumble upon one of them. *Holder.*

In that extent wherein the mind wanders in remote speculations, it stirs not one jot beyond those ideas which sense or reflection have *offered* for its contemplation. *Locke.*

Servants, placing happiness in strong drink, make court to my young master, by *offering* him that which they love. *Id.*

It is in the power of every one to make some essay, some *offer* and attempt, so as to shew that the heart is not idle or insensible, but that it is full and big, and knows itself to be so, though it wants strength to bring forth. *South's Sermons.*

When he commanded Abraham to sacrifice Isaac, the place of the *offering* was not left undetermined, and to the *offerer's* discretion. *Id.*

I enjoined all the ladies to tell the company, in case they had been in the siege, and had the same *offer* made them as the good women of that place, what every of them would have brought off with her, and have thought most worth the saving.

Addison's Spectator.

One sees in it a kind of *offer* at modern architecture, but, at the same time that the architect has shown his dislike of the Gothic manner, one may see that they were not arrived at the knowledge of the true way. *Id. on Italy.*

I'll favour her,

That my awakened soul may take her flight,
Renewed in all her strength, and fresh with life,
An *offering* fit for heaven. *Id. Cato.*

When a man is called upon to *offer up* himself to his conscience, and to resign to justice and truth, he should be so far from avoiding the lists, that he should rather enter with inclination, and thank God for the honour. *Collier.*

It contains the grounds of his doctrine, and *offers* at somewhat towards the disproof of mine.

Atterbury.

The Arians, Eunomians, and Macedonians, were then formally and solemnly challenged by the Catholics to refer the matter in dispute to the concurring judgment of the writers that lived before the controversy began; but they declined the *offer*.

Waterland.

Some nymphs there are, too conscious of their face;
These swell their prospects, and exalt their pride,
When *offers* are disdained, and love denied. *Pope.*

When stock is high, they come between,
Making by second hand their *offers*;
'Then cunningly retire unseen,
With each a million in his coffers. *Swift.*

Without *offering* at any other remedy, we hastily engaged in a war, which hath cost us sixty millions. *Id.*

Inferior offerings to thy god of vice,
Are duly paid in saddles, cards, and dice. *Young.*

The lover too shuns business and alarms,
Tender idolater of absent charms.

Saints offer nothing in their warmest prayers,

That he devotes not with a zeal like theirs :

'Tis consecration of his heart, soul, time ;

And every thought that wanders is a crime.

Cowper.

OFFERINGS, JEWISH. The Hebrews had several kinds of offerings, which they presented at the temple. Some were free-will offerings, and others were of obligation. The **FIRST-FRUIITS** (see that article), the tithes, the sin-offerings, were of obligation ; the peace-offerings, vows, offerings of wine, oil, bread, salt, &c., made to the temple or to the ministers of the Lord, were offerings of devotion. The Hebrews called all offerings in general corban. But the offerings of bread, salt, fruits, and liquors, as wine and oil, which were presented to the temple, they called *mincha*. The sacrifices are not properly offerings, and are not commonly included under that name. The offerings of grain, meal, bread, cakes, fruits, wine, salt, and oil, were common in the temple. Sometimes these offerings were alone, and sometimes they accompanied the sacrifices. Honey was never offered with the sacrifices ; but it might be offered alone in the quality of the first fruits. These were the rules that were observed in the presenting of those offerings, called in Hebrew *mincha* or *kerbon mincha* ; in the Septuagint, offerings of sacrifice ; and the same by St. Jerome, *oblationem sacrificii* ; but by our translators meat offerings (Lev. ii. 1, &c.) There were five sorts of these offerings : 1. Fine flour or meal. 2. Cakes of several sorts, baked in an oven. 3. Cakes baked upon a plate. 4. Another sort of cakes, baked upon a *gridiron*, or plate with holes in it. 5. The first fruits of the new corn, which were offered either pure and without mixture, or roasted or parched in the ear or out of the ear. The cakes were kneaded with olive oil, or fried with oil in a pan, or only dipped in oil after they were baked. The bread offered to be presented upon the altar was to be without leaven ; for leaven was never offered upon the altar, nor with the sacrifices : but they might make presents of common bread to the priests and ministers of the temple. The offerings now mentioned were appointed on account of the poorer sort, who could not go to the charge of sacrificing animals. Those that offered only oblations of bread or of meal offered also oil, incense, salt, and wine, which were in a manner the seasoning of it. The priest in waiting received the offerings from the hand of him that offered them ; laid a part of them upon the altar, and reserved the rest for his own subsistence, as his right. Nothing was burnt quite up but the incense, of which the priest kept back nothing for his own share. When an Israelite offered a loaf to the priest, or a cake, the priest broke the loaf or cake into two parts, setting that part aside that he reserved to himself, and broke the other into crumbs ; poured oil upon it, salt, wine, and incense ; and spread the whole upon the fire of the altar. If these offerings were accompanied by an animal for a sacrifice,

it was all thrown upon the victim, to be consumed along with it. If the offerings were the ears of new corn, either wheat or barley, these ears were parched at the fire or in the flame, and rubbed in the hand, and then offered to the priest in a vessel ; over which he put oil, incense, wine, and salt, and then burnt it upon the altar, first having taken as much of it as of right belonged to himself. The greatest part of these offerings were voluntary, and of pure devotion. But when an animal was offered in sacrifice, they were not at liberty to omit these offerings. Every thing was to be supplied that was to accompany the sacrifice, and which served as a seasoning to the victim. There were some cases in which the law required only offerings of corn, or bread : for example, when they offered the first fruits of their harvest, whether they were offered solemnly by the whole nation, or by the devotion of private persons. As to the quantity of meal, oil, wine, or salt, which was to go along with the sacrifices, we do not find that the law determined it. The priest threw a handful of meal or crumbs upon the fire of the altar, with wine, oil, and salt in proportion, and all the incense. All the rest belonged to him ; the quantity depended upon the liberality of the offerer. Moses appoints an *assaron*, or the tenth part of an *ephah* of meal, for those that had not wherewithal to offer the appointed sin-offering. (Lev. v. 11, xiv. 21.) In the solemn offerings of the first fruits of the whole nation, they offered an entire sheaf of corn, a lamb of a year old, two tenths of fine meal mixed with oil, and a quarter of a hin of wine for the libation. (Lev. xxiii. 10, 11, 12, &c.) In the sacrifice of jealousy (Numb. v. 15), when a husband accused his wife of infidelity, the husband offered the tenth part of a *satum* of barley-meal, without oil or incense, because it was a sacrifice of jealousy, to discover whether his wife was guilty or not. The offerings of the fruits of the earth, of bread, of wine, oil, and salt, are the most ancient of any that have come to our knowledge. Cain offered to the Lord of the fruits of the earth, the first fruits of his labor (Gen. iv. 3, 4) ; Abel offered the firstlings of his flocks, and of their fat.

|-------------------------------------|---|
| OFFICE, <i>n. s. & v. a.</i> | } <i>Fr. office ; Lat. officium.</i> Agency ; charge ; business ; particularly public business or agency ; magistracy ; employment in the service of the state ; devotion ; formulary of devotion ; place of business : to office is used by Shakespeare for to perform ; do : officer is, a public agent or servant ; particularly a military servant of the state ; also one who has the charge of apprehending criminals : officered is, furnished with officers : official is, appropriate or conducive to some assigned office ; also, as a noun substantive, an ecclesiastical officer described in the extract from Ayliffe : officiality is, charge, state or quality : to officiate is, to yield or give in course of office ; to discharge an office : officinal, used in a shop or druggist's office, applied to medicinal plants and drugs. |
| OFFICER, <i>n. s.</i> | |
| OFFICERED, <i>adj.</i> | |
| OFFICIAL, <i>adj. & n. s.</i> | |
| OFFICIALITY, <i>n. s.</i> | |
| OFFICIATE, <i>v. a. & v. n.</i> | |
| OFFICIAL, <i>n. s.</i> | |

Full thredbar was his overest courtessy,
For he hadde gotten him yet no benefice,
He was nought worldly to have an *office*.

Chaucer

You have contrived to take
From Rome all seasoned *offices*, and to wind
Yourself into a power tyrannical. *Shakespeare.*

This gate
Instructs you how t' adore the heavens, and bows you
To morning's holy *office*. *Id. Cymbeline.*

Wolves and bears,
Casting their savageness aside, have done
Like *offices* of pity. *Id. Winter's Tale.*
Methought this staff, mine *office*-badge in court,
Was broke in twain. *Id. Henry VI.*

What shall good old York see there,
But empty lodgings and unfurnished walls,
Unpeopled *offices*, untrodden stones? *Shakespeare.*

The thieves are posset with fear
So strongly, that they dare not meet each other;
Each takes his fellow for an *officer*. *Id.*

The tribunes
Endue you with the people's voice. Remains
That in the *official* marks invested, you
Anon do meet the senate. *Id. Coriolanus.*

I will begone, altho'
The air of Paradise did fan the house,
And angels *officed* all. *Shakespeare.*
Empson and Dudley, though they could not but
hear of these scruples in the king's conscience, yet as
if the king's soul and his money were in several
offices, that the one was not to intermeddle with the
other, went on with as great rage as ever. *Bacon.*

The next morning there came to us the same *officer*
that came to us at first to conduct us to the stranger's
house. *Id.*

A poor man found a priest over-familiar with his
wife, and, because he spake it abroad and could not
prove it, the priest sued him before the bishop's
official for defamation. *Camden.*

No minister *officiating* in the church can with a
good conscience omit any part of that which is com-
manded by the aforesaid law. *Sanderson.*

Whosoever hath children and servants, let him
take care that they say their prayers before they be-
gin their work; the Lord's prayer, the ten command-
ments, and the creed, is a very good *office* for them,
if they are not fitted for more regular *offices*. *Taylor.*

The sun was sunk, and after him the star
Of Hesperus, whose *office* is to bring
Twilight upon the earth. *Milton's Paradise Lost.*

All her numbered stars that seem to roll
Spaces incomprehensible, for such
Their distance argues, and their swift return
Diurnal, merely to *officiate* light
Round this opacous earth, this punctual spot. *Milton.*

In this animal are the guts, the stomach, and
other parts *official* unto nutrition, which, were its
aliment the empty reception of air, their provisions
had been superfluous. *Brown.*

Who of the bishops or priests that *officiate* at the
altar, in the places of their sepulchres, ever said, We
offer to thee Peter or Paul? *Stillingfleet.*

If it should fall into the French hands, all the
princes would return to be the several *officers* of his
court. *Temple.*

Is it the magistrate's *office* to hear causes or suits
at law, and to decide them? *Kettleworth.*

Since he has appointed *officers* to hear it, a suit at
law in itself must needs be innocent. *Id.*

You who your pious *offices* employ,
To save the reliques of abandoned Trov. *Dryden.*

If he did not nimbly ply the spade,
His surly *officer* ne'er failed to crack
His knotty cudgel on his tougher back. *Id.*
The wolf took occasion to do the fox a good *office*.
L'Estrange.

Birds of prey are an emblem of rapacious *officers*.
A superior power takes away by violence from them,
that which by violence they took away from others. *Id.*

What could we expect from an army *officer'd* by
Irish papists and outlaws? *Addison's Freeholder.*

To prove curates no servants is to rescue them
from that contempt which they will certainly fall into
under this notion; which, considering the number
of persons *officiating* this way, must be very prejudi-
cial to religion. *Collier.*

In this experiment the several intervals of the
teeth of the comb do the *offices* of so many prisms,
every interval producing the phenomenon of one
prism. *Newton's Opticks.*

The *office* of an *officialty* to an archdeacon.
Ayliffe.

Official is that person to whom the cognizance of
causes is committed by such as have ecclesiastical
jurisdiction. *Id.*

The bad disposition he made in landing his men,
shews him not only to be much inferior to Pompey
as a sea *officer*, but to have had little or no skill in
that element. *Arbuthnot.*

And make the symbols of atoning grace
An *office*-key; a picklock for a place. *Cowper.*

I hope I shall not depart from the simplicity of
official language in saying, that the majesty of justice
ought to be approached with solicitation. *Warren Hastings.*

Will they thank the noble lord for reminding us
how soon these lofty professions dwindled down to
little jobbing pursuits for followers or dependants, as
unfit to fill the *offices* procured for them, as the *offices*
themselves were unfit to be created? *Sheridan.*

He thinks that my right honourable friend, if in
office, would renounce the principle he has avowed. *Id.*

It is certainly true, that that charter was brought
from Brazil, who has filled, and still continues to
fill, an *office* of high trust from this country. *Canning.*

OFFICE, in the canon law, is used for a bene-
fice that has no jurisdiction annexed to it.

OFFICES, in architecture, denote all the apart-
ments appointed for the necessary occasions of
a palace or great house; as kitchen, pantries,
confectionaries, &c.

An OFFICER, in the army, is any person
entrusted with command. *General officers* are
those whose command is not limited to a single
troop or regiment, but extends to a body of
forces composed of several regiments; such are
the general, lieutenant-general, major-general,
and in some armies brigadier-general. *Staff-*
officers are the quarter-master-general, and the
adjutant-general, brigade officers, and aides-
de-camp; also the quarter-masters, adjutants,
the physicians, surgeons, and chaplains. *Com-*
missioned officers in our service are those ap-
pointed by the king's commission; such are all
from the general to the cornet and ensign, both
inclusive; and in the blues, or royal horse
guards, the quarter-master bears the king's com-
mission. Those persons are also called com-
missioned officers that act under the signature
of the lord-lieutenants of counties, or under that

of the colonel or commandant of a regiment, as in the militia, volunteer, and yeomanry corps. *Warrant officers*, those who have no commissions, but only warrants from such boards, or persons, as are authorised by the king to grant them. *Brevet officer*, one who, in doing duty with other corps, takes rank according to the commission which he holds from the king, and which is superior to the one for which he actually receives pay, or by which he can do duty in his own. A captain, for instance, in the sixty-second regiment of foot, who has the rank of brevet-major in the army, may, when that corps does brigade duty, command every captain on service with him. *Non-commissioned officers* are serjeant-majors, quarter-master serjeants, serjeants, corporals, drum and fife majors; who are nominated by their respective captains, and appointed by the commanding officers of regiments, and by them reduced without a court-martial. *Orderly non-commissioned officers* are those who are orderly, or on duty, for that week; who, on hearing the drum beat for orders, are to repair to the place appointed to receive them, and to take down in writing, in the orderly book, what is dictated by the adjutant, or serjeant-major: they are then immediately to show these orders to the officers of the company, and afterwards warn the men for duty.

OFFICERS, GREAT, OF THE CROWN, are, the lord high-steward, the lord high-chancellor, the lord high-treasurer, the lord high-president of the council, the lord privy seal, the lord chamberlain, the lord high-constable, and the earl-marshal; each of which see under its proper article.

OFFICERS, STAFF, are such as, in the king's presence, bear a white staff or wand; and at other times, on their going abroad, have it carried before them by a footman bare-headed; such are the lord-steward, lord-chamberlain, lord-treasurer, &c. The white staff is taken for a commission; and at the king's death each of these officers breaks his staff over the hearse made for the king's body, and thus lays down his commission, and discharges all his inferior officers.

OFFICIAL is also a deputy appointed by an archdeacon as his assistant, who sits as judge in the archdeacon's court.

OFFICIAL, in the canon law, an ecclesiastical judge, appointed by a bishop, chapter, abbot, &c., with charge of the spiritual jurisdiction of the diocese.

OFFICIOUS, *adj.* } Fr. *officieux*; Latin
OFFICIOUSLY, *adv.* } *officiosus*. Kind; per-
OFFICIOUSNESS, *n. s.* } forming good offices;
opportunately or obtrusively kind: hence im-
pertinent; meddling: the adverb and noun-sub-
stantive follow these senses.

You are too *officious*
In her behalf that scorns your services.

Shakespeare.

At Taunton they killed, in fury, an *officious* and
eager commissioner for the subsidy. Bacon.

Yet, not to earth are those bright luminaries
Officious; but to thee, earth's habitant. Milton.

In whom is required understanding as in a man,
courage and vivacity as in a lion, service and minis-

terial *officiousness* as in the ox, and expedition as in
the eagle. Browne.

The most corrupt are most obsequious grown,
And those they scorned *officiously* they own. Dryden.

Let thy goats *officiously* be nurst,
And led to living streams to quench their thirst. Id.

I shew my *officiousness* by an offering, though I
betray my poverty by the measure. South.

Cato, perhaps
I'm too *officious*; but my forward cares
Would fain preserve a life of so much value. Addison.

OFFING, or *OFFIN*, in the sea language, is that
part of the sea, a good distance from shore,
where there is deep water, and no need of a
pilot to conduct the ship: thus; if a ship from
shore be seen sailing out to seaward, they say,
she stands for the offing; and, if a ship, having
the shore near her, have another a good way
without her, or towards the sea, they say, that
ship is in the offing.

OFFSET, *n. s.* Off and set. Sprout; the
shoot of a plant.

They are multiplied not only by the seed, but
many also by the root, producing *offsets* or creeping
under ground. Ray.

Some plants are raised from any part of the root,
others by *offsets*, and in others the branches set in the
ground will take root. Locke.

OFFSCOURING, *n. s.* Off and scouring.
Recrement; part rubbed off in scouring or
cleansing.

Thou hast made us as the *offscouring* and refuse in
the midst of the people. Lamentations iii. 45.

Being accounted, as St. Paul says, the very filth
of the world, and the *offscouring* of all things. Kettlewell.

OFFSPRING. Off and spring. Propaga-
tion: more generally that which is propagated;
children; descendants; production.

All things coveting to be like unto God in being
ever, that which cannot hereunto attain personally
doth seem to continue itself by *offspring* and propa-
gation. Hooker.

When the fountain of mankind
Did draw corruption, and God's curse, by sin;
This was a charge, that all his heirs did bind,
And all his *offspring* grew corrupt therein. Davies.

Tho' both fell before their hour,
Time on their *offspring* hath no power;
Nor fire nor fate their bays shall blast,
Nor death's dark vale their days o'ercast. Denham.

To the gods alone
Our future *offspring*, and our wives are known. Dryden.

His principal actor is the son of a goddess, not to
mention the *offspring* of other deities. Addison.

OFT, *adv.* } Sax. *oft*; Teut. *oft*, *often*.
OFTEN, } Frequent: this both *oft* and
OFTENTIMES, } often signify; and, as Dr. John-
OFTTIMES, } son observes, the latter was
probably a long time the plural of the former: of-
times and oftentimes are, frequently; many times.

In labours more abundant, in stripes above mea-
sure, in prisons more frequent, in deaths *oft*. 2 Corinthians ii. 28.

Use a little wine for thy stomach's sake, and thine
often infirmities. 1 Timothy v. 23.

Is our faith in the blessed Trinity a matter needless, to be so *oftentimes* mentioned and opened in the principal part of that duty which we owe to God, our public prayer? *Hooker.*

The queen that bore thee,
Oftener upon her knees than on her feet,
 Died every day she lived. *Shakespeare. Macbeth.*
 A lusty black-browed girl, with forehead broad
 and high,
 That *often* had bewitched the sea gods with her eye. *Drayton.*

Who was ever so wise as not sometimes to be a fool in his own conceit, *oftentimes* in the conceit of others? *Hall.*

It may be a true faith, for so much as it is; it is one part of true faith, which is *oft* mistaken for the whole. *Hawmand.*

Oftentimes nothing profits more
 Than self-esteem, grounded on just and right,
 Well managed. *Milton's Paradise Lost.*

These sort of speeches, issuing from just and honest indignation, are sometimes excusable, *oftentimes* commendable. *Barrow.*

Oftentimes before I hither did resort,
 Charmed with the conversation of a man
 Who led a rural life. *Dryden and Lee.*

Who does not more admire Cicero as an author, than as a consul of Rome, and does not *oftener* talk of the celebrated writers of our own country in former ages, than of any among their contemporaries? *Addison's Freshholder.*

The difficulty was, by what means they could ever arrive to places *often times* so remote from the ocean. *Woodward.*

It is equally necessary that there should be a future state, to vindicate the justice of God, and solve the present irregularities of Providence, whether the best men be *oftentimes* only, or always the most miserable. *Atterbury.*

Favours to none, to all she smiles extends,
Oft she rejects, but never once offends. *Pope.*

The sun
 Sheds weak and blunt his wide refracted ray,
 Whence glaring *oft* with many a broadened orb
 He frights the nations. *Thomson.*

Some men employ their health, an ugly trick,
 In making known how *oft* they have been sick,
 And give us in recitals of disease
 A doctor's trouble, but without the fees. *Cowper.*

OG. Heb. אֶבֶן, i.e. a cake. A king of Beshan, of a most gigantic stature. His bedstead was of iron, and was nine cubits long and four broad; which, according to some calculations, is sixteen feet five inches long, and above seven feet three inches broad. The learned Calmet, however, makes it only fifteen feet four inches long, and six feet ten inches broad. Wolfius makes Og more than thirteen feet high. The rabbis pretend that he lived before the flood, and preserved himself during the time of it, by mounting on the outside of the ark and receiving food from Noah, &c. When he heard of the defeat of Sihon, king of the Amorites, by Moses, he collected all his troops and attacked the Israelites at Edrei; but his numerous host was routed, himself killed, and his country conquered. The Ammonites some time afterwards carried off his iron bedstead. Num. xxi.; Deut. iii. 1—14.

OGÉ, a creole, or quarteroon, of St. Domingo, was, at the commencement of the revolution, established at Cape François in commerce. His affairs having drawn him to Paris, he was there

admitted into the society of Amis des Noirs, and warmly solicited the National Assembly in favor of his brethren. Meeting with little attention he returned to St. Domingo, resolved to adopt some more efficacious means for their freedom. In the quarter of Dondon, where he was born, he began by inviting all the people of color and negro slaves to join him, and an insurrection took place in November, 1790, in the Grande Riviere. The insurgents at first demanded nothing but freedom and equality; but their cause was ere long disgraced by crime. These, however are said not to be fairly attributable to their leader, but to his lieutenant Chavaannes. Troops of the national guard and of the line being sent against the blacks, they were obliged to give way; and Ogé, with a few of his followers, took refuge in the Spanish territories. Here he was given up by the governor to the French, tried before the superior council at Cape François, and condemned, with his lieutenant, to be broken on the wheel. Ogé, on hearing this sentence, took a measure of black seed in his hand, and covered them with a few white grains: he then shook them together, and said to his judges, 'Where are the whites?'

OGÉE, n. s. } A sort of moulding in ar-
 OGIVE. } chitecture, consisting of a round
 and a hollow, almost in the form of an S, and is the same with what Vitruvius calls cima. Cima reversa is an oggee with the hollow downwards.

OGEECHÉE, a river of Georgia, United States, which rises near the Apalachian Mountains, passes by Lexington, Louisville, and Georgetown, flows south-east nearly parallel with the Altamaha, into Ossabaw Sound, at Hardwick. Length 200 miles.

OGHAMS, a particular kind of steganography, or writing in cypher, practised by the Irish; of which there were three kinds: the first was composed of certain lines and marks, which derived their power from their situation and position, as they stand in relation to one principal line over or under which they are placed, or through which they are drawn; the principal line is horizontal, and serves for a rule or guide, whose upper part is called the left, and the under side the right: above, under, and through which line, the characters or marks are drawn, which stand in the place of vowels, consonants, diphthongs, and triphthongs. Some authors have doubted the existence of this species of writing in cypher, called ogham among the Irish; but several MSS. in this character still exist.

OGILBY (John), an eminent writer, born in or near Edinburgh, November 17th, 1600. His father having spent his estate, and being prisoner in the King's Bench, could contribute little to his education; however, he obtained some knowledge in the Latin grammar, and afterwards so much money as to procure his father's discharge from prison, and to bind himself an apprentice to a dancing-master in London; when, by his dexterity in his profession, he obtained money to buy out the remainder of his time, and to set up for himself. But, being afterwards appointed to dance in the duke of Buckingham's grand mask, he strained a vein in the inside of his leg,

which occasioned his being ever after somewhat lame. When Thomas earl of Strafford was made lord-lieutenant of Ireland he was entered as a dancing-master in his family, and made one of the earl's troop of guards; at which time he composed a humorous piece called the Character of a trooper. He was soon after appointed master of the revels in Ireland, and built a theatre at Dublin. About the end of the war in England, he left Ireland, and, being shipwrecked, came to London in a necessitous condition; but soon after walked to Cambridge, where, being assisted by several scholars, he became so complete a master of the Latin tongue, that in 1649 he published a translation of Virgil. He soon after learned Greek; and in 1660 published, in folio, a translation of Homer's *Iliad*, with Annotations. In 1662 he went into Ireland, where he was made master of the revels by patent. He then built another theatre in Dublin, which cost him about £1000. He published at London, in folio, a translation of Homer's *Odyssey*, with Annotations; and afterwards wrote two heroic poems, entitled the *Ephesian Matron*, and the *Roman Slaves*. He next composed the *Charolics*, an epic poem, in twelve books, in honor of king Charles I., but this was lost in the fire of London; when his house in White Friars was burnt down, and his whole fortune, except about £5, destroyed. He however, got his house rebuilt, set up a printing-office, was appointed cosmographer and geographic printer, and printed several large works, translated or collected by himself and his assistants, particularly his *Atlas*. He died in 1676.

OGIVE, in architecture, an arch or branch of a Gothic vault; which, instead of being circular, passes diagonally from one angle to another and forms a cross with the other arches. The middle, where the ogives cross each other, is called the key; being cut in form of a rose, or a cul de lampe. The members or mouldings of the ogives are called nerves, branches, or reins; and the arches which separate the ogives, double arches.

OGLE, *v. a. & n. s.* *Belgic oogh, ooghtler*; *Lat. oculus*. To survey wistfully; regard with a kind of sly fondness; one who thus gazes at an object.

From their high scaffold with a trumpet cheek,
And *ogling* all their audience, then they speak.

Dryden.

If the female tongue will be in motion, why should it not be set to go right? Could they talk of the different aspects and conjunctions of planets, they need not be at the pains to comment upon *oglings* and clandestine marriages.

Addison.

Upon the disuse of the neck-piece, the tribe of *oglers* stared the fair sex in the neck rather than in the face.

Id.

Jack was a prodigious *ogler*; he would *ogle* you the outside of his eye inward, and the white upward.

Arbutnot.

Whom is he *ogling* yonder! himself in his looking-glass.

Id.

SRA ANTH. Z—ds, sirrah! the lady shall be as ugly as I choose: she shall have a hump on each shoulder; she shall be as crooked as the crescent; her one eye shall roll like the bull's in Cox's museum; she shall have a skin like a mummy, and the beard of a Jew—she shall be all this, sirrah!—yet

I will make you *ogle* her all day, and sit up all night to write sonnets on her beauty.

Sherriden.

OGLETHORPE, a county in the north-west part of Georgia. Population 12,297. Chief town, Lexington.

OGLETHORPE (James Edward), a British officer, of a very ancient family in Yorkshire, born about 1698. He entered early into the army, and was made a captain-lieutenant in the queen's grenadiers in 1715. He obtained the rank of colonel, August 25th, 1737; of major-general, March 30th, 1745; lieutenant-general, September 13th, 1747; and of general, February 22d, 1765. He was elected M. P. for Haslemere in Surrey in 1722, and continued to represent that borough till 1754. In 1729, finding a gentleman, whom he went to visit in the Fleet prison, loaded with irons and otherwise barbarously used, he engaged in the philanthropic enquiry into the state of the jails, and was appointed chairman of the Committee of Enquiry by the House of Commons. In 1732 he was appointed governor of Georgia, in the settlement of which he engaged with that ardor which marked all his undertakings; and, after overcoming numberless difficulties, proved successful, though at the expense of large sums of his private fortune, which, it is said, were never repaid. In 1734 he returned to England, and was chosen deputy governor of the African Company; and in 1735 carried back with him to Georgia Messrs. John and Charles Wesley, with the pious intention of instructing the Indians. Returning to England, he raised a regiment, which he carried over to Georgia in 1738. In 1740 he attacked the Spaniards, took two forts, and besieged St. Augustine, but without success. In 1742 the Spaniards attacked the new settlement, but were repulsed. In 1745 he accompanied the duke of Cumberland into Scotland, which was his last military expedition. In 1754 he married Elizabeth Wright, an heiress, and spent the rest of his life in easy retirement at her seat of Cranham Hall in Essex; where he died, June 30th, 1785.

O'GLIO, *n. s.* *Span. olla*; *Port. olla*; or *Ital. alla* (a stewpan). A dish of medleys, or various kinds of meat; a hotchpotch, mental or literal.

These general motives of the common good, I will not so much as once offer up to your lordship, though they have still the upper end; yet, like great *oglios*, they rather make a shew than provoke appetite.

Suckling.

Where is there such an *oglio* or medley of various opinions in the world again, as those men entertain in their service, without any scruple as to the diversity of their sects and opinions?

King Charles.

He that keeps an open house, should consider that there are *oglios* of guests, as well as of dishes, and that the liberty of a common table is as good as a tacit invitation to all sorts of intruders.

L'Estrange.

OGLIO, a river of Austrian Italy, which has its source in the Alps, flows through the lake of Isco, traverses the plains between the Brescian and the Cremonese, and joins the Po near Borgoforte, eight miles from Mantua. It is navigable in the lower part of its course to Ponte-vico, and receives in its progress the Cherio, the

Milla, the Chiese, and a number of smaller streams. It gave name to a department of the late kingdom of Italy.

OGYGIA, the island of Calypso (Homer); placed by Pliny in the Sinus Scylaceus, in the Ionian Sea, opposite to the promontory Lacinium; by Mela who calls it Eac, in the strait of Sicily: others place it at the promontory Circæum, and call it the island of Circæ.

OH! *interj.* A note of pain, sorrow, or wonder.

He,
Like a full corned boar, a churning on,
Cried oh! and mounted.

Shakespeare. Cymbeline.

Oh me! all the horse have got over the river, what shall we do?
Walton's Angler.

My eyes confess it,
My every action speaks my heart aloud;
But oh the madness of my high attempt
Speaks louder yet! *Dryden's Spanish Fryar.*

Oh Sophonisba, Sophonisba, oh! *Thomson.*

Oh! that the present hour would lend
Another despot of the kind
Such chains as his were sure to bind. *Byron.*

Oh marked from birth, and nurtured for the skies,
In youth with more than learning's wisdom wise.

Canning.

OHETEROA, an island of the South Pacific, discovered by captain Cook, about twelve miles in circumference, without either harbour or anchorage. It has only a bay on the west coast, which is foul and rocky. The inhabitants are active and well made, of a dark brown complexion. Their clothing is of bark curiously colored: some wear bonnets, adorned with feathers. It has no coral reef, and is in long. 150° 47' W., lat. 22° 27' S.

OHIO, a river of the United States, formed by the union of the Alleghany and the Monongahela, at Pittsburg. It separates Virginia and Kentucky on the south from the states of Ohio and Indiana, and the Illinois territory, on the north; and, after a W. S. W. course of 949 miles, joins the Mississippi, 193 miles below the Missouri, in long. 88° 58' W., lat. 37° N. From Pittsburg to its mouth, by a direct line, it is only 614 miles. The river varies in breadth from 400 to 1400 yards. At Cincinnati it is 534 yards, which may be regarded its mean breadth. It has an inland navigation. Its current is very gentle, and nowhere broken by any considerable falls, except at Louisville. The whole descent here, in two miles, is twenty-two feet and a half; but the current is not so broken but that boats have, in many instances, ascended the falls. A canal is contemplated around these falls.

The annual range from high to low water is upwards of fifty feet, and its extreme range about sixty feet. When lowest it may be forded in several places above Louisville. It is frozen over almost every winter near Pittsburg, and has been frozen about 400 miles below Pittsburg. The

navigation is generally suspended eight or ten weeks, during the winter, by floating ice. Its current, when at mean height, is estimated at three miles an hour; when very low, two miles. The river contains 100 islands, but there are none between the states of Ohio and Kentucky. Steam boats are now employed on this river with great advantage. The principal towns on the Ohio, below Pittsburg, are Steubenville, Wheeling, Marietta, Gallipolis, Maysville, Cincinnati, Louisville, and Jeffersonville.

The length of the Ohio, from Pittsburg to the Mississippi, as measured, according to its meanders, by captain Hutchins, is 1188 miles. But, according to the public surveys on the north bank, it is only 949 miles. The following table of distances is taken from Dr. Drake, and is founded chiefly on those surveys. This table differs considerably from that of Hutchins:—

| | Miles. | Whole dist. |
|-------------------------------|--------|-------------|
| From Pittsburg to | | |
| Big Beaver River | 30 | 30 |
| Little Beaver River | 13 | 43 |
| Steubenville | 26 | 69 |
| Wheeling | 26 | 95 |
| Marietta | 83 | 178 |
| Great Kenhawa River | 87 | 265 |
| Big Sandy River | 47 | 312 |
| Scioto River | 40 | 352 |
| Maysville | 50 | 402 |
| Little Miami River | 56 | 458 |
| Cincinnati | 7 | 465 |
| Great Miami River | 20 | 485 |
| Kentucky River | 48 | 533 |
| Louisville | 54 | 587 |
| Salt River | 23 | 610 |
| Anderson's River | 98 | 708 |
| Green River | 52 | 760 |
| Wabash River | 61 | 821 |
| Shawneetown | 10 | 831 |
| Cave-in-rock | 20 | 851 |
| Cumberland River | 40 | 891 |
| Tennessee River | 12 | 903 |
| Fort Massie | 8 | 911 |
| Mississippi | 38 | 949 |

OHIO, one of the United States of North America, is bounded north by Michigan territory, east by Pennsylvania, south by the river Ohio, which separates it from Virginia and Kentucky, and west by Indiana. Long. 80° 35' to 84° 47' W., lat. 38° 30' to 42° N.: 216 miles long, and 216 broad; containing 39,128 square miles. Population in 1800 45,365; in 1810 230,760; and in 1815 it was estimated at 324,070. The number of militia in 1816 was 49,427.

Columbus is the seat of government; but Cincinnati is much the largest town. The other most considerable towns are Chillicothe, Steubenville, Zanesville, Marietta, Dayton, New Lancaster, New Lisbon, St. Clairsville, Urbana, Lebanon, Circleville, and Gallipolis. There are besides a number of other flourishing towns.

The Counties, number of Towns, population for 1810, and 1815, and the Chief Towns are exhibited in the following Table.

| Counties. | Towns. | Population. 1810. | Population. 1815. | Chief Towns. |
|----------------------|--------|----------------------|----------------------|------------------|
| Adams | 9 | 9,434 | 10,410 | West Union. |
| Ashtabula | | | 3,200 | Jefferson. |
| Athens | 4 | 2,791 | 3,960 | Athens. |
| Belmont | 11 | 11,097 | 12,200 | St. Clairsville. |
| Brown | | | | Ripley. |
| Butler | 9 | 11,150 | 11,890 | Hamilton. |
| Champaign | 9 | 6,303 | 10,460 | Urbana. |
| Clark | | | | Springfield. |
| Clermont | 8 | 9,965 | 12,240 | Williamsburg. |
| Clinton | 3 | 2,674 | 4,600 | Wilmington. |
| Columbiana | 17 | 10,878 | 13,600 | New Lisbon. |
| Coshocton | | | 3,000 | Coshocton. |
| Cuyahoga | 4 | 1,459 | 2,500 | Cleveland. |
| Dark | | | 1,500 | Greenville. |
| Delaware | 7 | 2,000 | 5,000 | Delaware. |
| Fairfield | 15 | 4,361 | 13,660 | New Lancaster. |
| Fayette | 4 | 1,854 | 3,700 | Washington. |
| Franklin | 8 | 3,486 | 6,800 | Franklinton. |
| | | | | COLUMBUS. |
| Gallia | 12 | 4,181 | 6,000 | Gallipolis. |
| Geauga | 8 | 2,917 | 3,000 | Chardon. |
| Guernsey | 9 | 3,051 | 4,800 | Cambridge. |
| Green | 6 | 5,870 | 8,000 | Xenia. |
| Hamilton | 11 | 15,258 | 18,700 | Cincinnati. |
| Harrison | | | 7,300 | Cadiz. |
| Highland | 7 | 5,760 | 7,300 | Hillsborough. |
| Huron | | | 1,500 | Huron. |
| Jackson | | | | Jackson. |
| Jefferson | 15 | 17,260 | 15,000 | Steubenville. |
| Knox | 5 | 2,149 | 3,000 | Mount Vernon. |
| Licking | 7 | 3,852 | 6,400 | Newark. |
| Logan | | | | Belville. |
| Madison | 6 | 1,603 | 2,100 | New London. |
| Medina | | | | Mecca. |
| Miami | 6 | 3,941 | 5,910 | Troy. |
| Monroe | | | 1,200 | Woodsfield. |
| Montgomery | 7 | 7,722 | 13,700 | Dayton. |
| Morgan | | | | |
| Muskingum | 11 | 10,036 | 11,200 | Zanesville. |
| Perry | | | | Somerset. |
| Pickaway | 10 | 7,124 | 9,260 | Circleville. |
| Pike | | | | Piketon. |
| Portage | 9 | 2,995 | 6,000 | Ravenna. |
| Preble | 7 | 3,304 | 5,509 | Eaton. |
| Richland | | | 3,900 | Mansfield. |
| Ross | 16 | 15,514 | 18,000 | Chillicothe. |
| Scioto | 9 | 3,399 | 3,870 | Portsmouth. |
| Stark | 7 | 2,734 | 6,625 | Canton. |
| Trumbull | 19 | 8,671 | 10,000 | Warren. |
| Tuscarawas | | 3,045 | 3,880 | N. Philadelphia. |
| Warren | 5 | 9,925 | 12,000 | Lebanon. |
| Washington | 12 | 5,991 | 3,800 | Marietta. |
| Wayne | | | 7,100 | Wooster. |
| 52 | 320 | 230,760 | 322,790 | |

There have been twenty-nine banks chartered in this state; and charters have been granted for three institutions, styled universities, in this state, at Athens, Cincinnati, and Oxford. The Ohio university at Athens has commenced its

operations. There is a respectable literary seminary also at Cincinnati, and academies have been established at Athens, Burton, Chillicothe, Dayton, Lebanon, Marietta, Putnam, Steubenville, Tallmadge, Worthington, and Xenia. In but

few of these, however, are kept regular classical schools. Common schools are encouraged more or less throughout the state.

The number of ministers of the several denominations of Christians in Ohio, in 1817, was stated as follows:—Presbyterians forty-eight; Methodists thirty-four; Baptists thirteen; New Lights of the Christian church nine; Seceders six; Episcopalians three; Congregationalists three. The number of meetings of Friends in this state and Indiana was stated at fifty-nine.

The legislature is composed of a senate and house of representatives. The latter, who must not exceed seventy-two, nor be less than thirty-six in number, are elected annually. The senators, who must equal one third, but not exceed one-half of the number of representatives, are chosen biennially. The governor is elected biennially by the people. The annual elections are held on the second Tuesday in October. This state sends six members to congress.

The rivers which flow into Lake Erie on the north are Maumee, Sandusky, Huron, Vermilion, Black, Cuyahoga, Grand, and Ashtabula; those in the south flowing into the Ohio are the Muskingum, Hockhocking, and Little and Great Miami. The Au-Glaize and St. Mary's in the western part of the state are branches of the Maumee.

The interior and northern parts of the country bordering on Lake Erie are generally level, and in some places marshy. Nearly one-third of the eastern and south-eastern part is very hilly and broken. The hills are exceedingly numerous, but they seldom rise into considerable mountains. Immediately upon the banks of the Ohio, and several of its tributaries, are numerous tracts of interval or meadow land, of great fertility. In the interior, on both sides of the Scioto, and on the Great and Little Miami, are perhaps the most extensive bodies of level and rich land in the state. In many parts there are large prairies, particularly on the head waters of the Muskingum and Scioto, and between the Scioto and the two Miamies. Some of these prairies are low and marshy, producing large quantities of coarse grass, from two to five feet high; some of which is of a tolerably good quality: other prairies are elevated, and are frequently called barrens; not always on account of their sterility, for they are often fertile. The most elevated tracts of country between the rivers are the wettest and most marshy in the state; and the driest land is that which borders on the various streams of water. Among the forest trees are oak of various species, maple, hickory, beech, birch, poplar, sycamore, ash, pawpaw, buckeye, cherry, &c.

Wheat is the staple production. Other sorts of grain, various kinds of fruit, grass, hemp, and flax, are extensively cultivated. From seventy to 100 bushels of Indian corn, it is said, have in many instances been produced in a year from one acre.

Coal is found in great quantities in the eastern parts. Iron ore has been discovered and wrought pretty extensively in several places, particularly on the south of Licking River, four miles west of Zanesville, on Brush Creek, and in some other places. Salt springs are found on some of the eastern waters of Muskingum, and on Salt

Creek, twenty-eight miles south-east of Chilli-cothe, where there are considerable salt works.

The summers are warm and pretty regular, though somewhat subject to tornadoes. Spring and autumn are very pleasant; and the winters generally mild. In some parts near the marshes and stagnant waters the inhabitants are subject to the fever and ague; but the climate generally is accounted remarkably healthy. The north-west part of the state, amounting in extent to nearly 8000 square miles, remains in the possession of the Indian tribes.

OHIO, a county in the north-west part of Virginia, bounded north-west and west by the Ohio, north by Brooke county and Pennsylvania, east by Pennsylvania, south-east by Monongalia and Harrison counties, and south-west by Wood county. Population 8175. Chief town Wheeling. Also a county in the west part of Kentucky, on the Ohio. Population 3792. Chief town Hartford.

OHITTAHOO, an island of the South Pacific, about nine miles in length and twenty-one in circuit. A ridge of hills runs through its length. It is divided by deep and fertile valleys, adorned with trees, and watered by brooks and cascades. On the western side are several coves. That in which the Europeans usually anchor is situated in long. 139° 8' W., lat. 9° 55' S. This island, and the three which lie nearest it, were discovered in July 1595 by Alvaro Mendana, who named them, in honor of the viceroy of Peru, Las Marquesas de Mendocana.

OHLAU, a town of Prussian Silesia, on the river Ohlau, fourteen miles south-east of Breslau. A large quantity of tobacco is raised in the environs. Population 2800.

OHRDRUFF, a town of Saxe-Gotha, the chief place of the county of Gleichen, a territory belonging to the prince of Hohenlohe. It stands at the commencement of the forest of Thuringia, on the Ohr. It is surrounded with a wall, and has a considerable number of manufacturing establishments, such as paper, saw and oil mills: the weaving of woollen and linen is also carried on. Its bleachfields are of some extent. Inhabitants 4200. Ten miles south of Gotha.

OIL, *n. s. & v. a.* Sax. *ael*; Fr. *huile*; Ital. *oglio*; Latin *oleum*; Gr. *elaion*. The expressed juice of the olive; any unctuous expressed juice of this kind: to lubricate or cover with oil: oil-color is a color made by grinding various substances in oil: oiliness, unctuousness; oily quality: oil-man and oil-shop are the man who deals in oils, and place where they are sold: oily means consisting of, containing or resembling oil: oily-grain and oily-palm are plants.

Being pure oil olive beaten for the light. *Erad.*
This oily rascal is known as well as Paul's;
Go call him forth. *Shakespeare. Henry IV.*
Basil hath fat and succulent leaves; which oiliness, if drawn forth by the sun, will make a very great change. *Bacon.*
The cloud, if it were oily or fatty, will not discharge; not because it is thick faster, but because air preyeth upon water and flame, and fire upon oil. *Id. Natural History.*

The men sell a rubbing of armour, which a great while had lain *oiled*. *Watton.*

Flame is grosser than gross fire, by reason of the mixture with it of that viscous *oily* matter, which, being drawn out of the wood and candle, serves for fuel. *Digby.*

Smoke from unctuous bodies, and such whose *oiliness* is evident, he nameth *nidor*. *Browne.*

Amber will attract straws thus *oiled*, it will convert the needles of dials, made either of brass or iron, although they be much *oiled*, for in those needles consisting free upon their center there can be no adhesion. *Id. Vulgar Errors.*

Oilcolours, after they are brought to their due temper, may be preserved long in some degree of softness, kept all the while under water. *Boyle.*

After this expressed *oil*, we made trial of a distilled one; and for that purpose made choice of the common *oil* or spirit. *Id.*

Chyle has the same principles as milk, viscosity from the caseous parts, an *oiliness* from the butyrateous parts, and an acidity from the tartareous. *Floyer.*

The flesh of animals which live upon other animals is most antacid; though offensive to the stomach sometimes by reason of their *oiliness*. *Arbuthnot on Aliments.*

In most birds there is only one gland; in which are divers cells, ending in two or three larger cells, lying under the nipple of the *oil* bag. *Derham.*

Oil with chemists called sulphur is the second of their hypostatical, and of the true five chemical principles. It is an inflammable, unctuous, subtle substance, which usually rises after the spirit. The chemists attribute to this principle all diversity of colours. There are two sorts of *oil*; one of which will swim upon water, as *oil* of aniseed and lavender, which the chemists call *essential*; and another kind, which probably is mixt with salts, and will sink in water, as the *oil* of guaiacum and cloves. *Harris.*

Swift *oils* many a spring which Harley moves. *Swift.*

A curious artist long inured to toils
Of gentler sort, with combs, and fragrant *oils*,
Whether by chance, or by some god inspired,
So toucht his curls, his mighty soul was fired.

Young.

—So, warm and buoyant in his *oily* mail,
Gambols on seas of ice the unwieldy whale;
Wide waving fins round floating islands urge
His bulk gigantic through the troubled surge.

Darwin.

Oils are defined by modern chemists to be proper juices of a fat or unctuous nature, either solid or fluid, indissoluble in water, combustible with flame, and volatile in different degrees. They are never formed but by organic bodies, and all substances in the mineral kingdom which present oily characters have originated from the action of vegetable or animal life. Oil then is a term which comprizes a great multitude of unctuous liquids, which, when dropped upon paper, sink into it, and make it semi-transparent; or, in common language, give it a greasy stain. Many of these have been known from a very remote period, and especially those which are appropriated to burning in lamps, since we know that lamps furnished with this material were in use as far back as the epoch of Abraham. The olive plant was very early cultivated, and oil extracted from it in Egypt. Cecrops introduced it into Greece from Sais, a town of Lower Egypt, where it had long been cultivated, and taught

Vol. XV.

the Athenians the method of obtaining the oil; and from Greece the use of olive oil has progressively spread over all Europe.

It is, however, a singular circumstance that Homer makes no mention of the use of lamps, and constantly describes his heroes as lighted by torches of wood; from which circumstance we may safely collect that the Greeks did not appropriate oil to this purpose till a period subsequent to the Trojan war.

In the comprehensive sense in which the term is employed in modern chemistry, it has been necessary to arrange the substances which it comprises under different heads. Thus unctuous vegetable oils comprehend those which are usually known under the name of fixed, expressed, or heavy oils. Fixed oil is mostly procured from the fruits or seeds of vegetables, by expression, or by decoction with water. When pure it is inodorous, and almost perfectly insipid; but is often mixed with the mucilaginous or extractive matter of the vegetable from which it is extracted; from which it acquires taste and odor, and by which the oils of particular vegetables are distinguished from each other. Cold-drawn oil is more pure than when expressed with the aid of heat, or extracted by decoction. Fixed oils are thick and unctuous, lighter than water, congeal by exposure to cold, and some are even concrete in the usual temperature. Fixed oil is insoluble in water or alcohol. Exposed to warm air it absorbs oxygen, becomes thick and colored, acquires a disagreeable odor, and a sharp unpleasant taste, changing to what is called rancescence. It boils at 600° of Fahrenheit, is changed into vapor which is readily inflamed, and is thereby converted into water and carbonic acid. Without materially raising its temperature it burns imperfectly in a common lamp, giving out a considerable quantity of smoke, which consists of carbonaceous matter and empyreumatic oil. With a very slender wick, or a cylindrical one properly managed, it is almost totally converted into water and carbonic acid, as in the combustion of its vapor. By distillation, in close vessels, it loses its mildness and unctuousity, becomes more limpid and volatile, and a portion of carbonaceous matter is left in the retort. Transmitted through an ignited tube it is converted into carbonic acid and hydro-carbonic gas. Sulphuric acid renders it black; part of the oxygen from the acid combines with the hydrogen of the oil, carbonaceous matter is deposited, and a thickish liquid, having a hepatic smell, is formed, which has not hitherto been analysed, but which may probably contain sulphur, or its oxide, combined with a part of the oil, in a state similar to petroleum. Nitric acid thickens expressed oil; and when empyreumatic or rancid, from expression by heat or otherwise, readily sets it on fire. Oxymuriatic acid thickens it, and in some instances renders it concrete. All these changes deserve minute investigation.

Water seems to be incapable of combining with fixed oil in any proportion. If the two fluids are strongly shaken together in a half filled phial, the oil is broken into very minute globules, and thus gives the water the appearance of thin milk or whey; but, after standing for a few se-

L

conds, the whole of the oil rises to the surface, and the two liquors remain as clear and distinct as at first. That a considerable attraction, however, subsists between the water and the oil is manifest from the well known fact that if a drop of oil be let fall into a basin of water it does not retain its globular form, but immediately spreads itself into a thin iridescent film, with which the whole surface of the water is covered.

The method of procuring oils by expression is very simple: thus if either sweet or bitter almonds, that are fresh, be pounded in a mortar, the oil may be forced out with a press, not heated: and in the same manner should the oil be pressed from linseed and mustard. The avoiding the use of heat, in preparing those oils intended for internal medicinal use, is of great importance, as heat gives them a very prejudicial rancidness. This method holds of all those vegetable matters that contain a copious oil in a loose manner, or in certain cavities or receptacles; the sides of which being broken or squeezed makes them let go the oil they contain; and thus the zest or oil of lemon peel, orange peel, citron peel, &c., may be readily obtained by pressure, without the use of fire. But how far this method of obtaining oils may be applied to advantage seems not hitherto considered. It has been commonly applied to olives, almonds, linseed, rapeseed, beech mast, ben-nuts, walnuts, bay-berries, mace, nutmeg, &c., but not, that we know of, to juniper berries, cashew-nuts, Indian cloves, pine-apples, and many other substances that might be enumerated both of foreign and domestic growth. It has, however, been of late successfully applied to mustard-seed, so as to extract a curious gold-colored oil, leaving a cake behind fit for making the common table mustard. Certain dry matters, as well as moist ones, may be made to afford oils by expression, by grinding them into a meal, which being suspended to receive the vapor of boiling water will thus be moistened so as to afford an oil in the same manner as almonds; and thus an oil may be procured from linseed, hemp-seed, lettuce-seed, white poppy-seed, &c. Oils obtained by expression should be suffered to deplete themselves by standing in a moderately cool place, to separate from their water, and deposit their feces; from both which they ought to be carefully freed. And if they are not thus rendered sufficiently pure they may be washed well with fresh water, then thoroughly separated from it again by the separating glass, whereby they will be rendered bright and clear.

In the arts fixed oils are of the most extensive utility. They are employed in the fabrication of soaps, for mixing colors in painting, for some kinds of varnish, and for defending substances from the action of air and moisture. The greater or less period of time these unctuous substances have been subjected to the action of fire, the greater or less is their degree of thickness and consistency. The oil of walnuts is especially serviceable to the painter in grinding and diluting his colors; and that of the aspic (a species of lavender) has also been strongly recommended for the purpose of rendering the colors already mixed smoother, firmer, and more siccative. The oil of the white poppy, extracted from the plant

of that name, is clearer and whiter than any other. That produced from flax is of a deep yellow, and very fat. M. Millan speaks of boiling this or walnut oil with litharge and onions until the latter are reduced to cinder: this composition, he says, is useful to mix with black, brown, and other colors which have little body and do not dry readily.

Expressed oil unites, by boiling, with sulphur into a compound which has an excessively offensive odor, and a very disagreeable acrid taste, usually called balsam of sulphur. It likewise combines with phosphorus, and unites with gum, resin, and several other vegetable products. With mucilage it forms a milky compound, called in pharmacy emulsion, and with sugar what is called oleo-saccharum. The ultimate elements of expressed oil, so far as is yet known, are carbon, hydrogen, and oxygen.

Volatile or essential oil is procurable from a variety of parts of many vegetables, usually by distillation with water. A small part unites with the distilled water, and the rest swims, for the most part, on the surface, though a few of these oils are heavier than water. Sometimes this oil is contained in distinct vesicles of the vegetable, and is obtained by expression. In volatile oil the peculiar odor of each plant is generally found, from which the term essential is derived; and, although from some highly odorant vegetables very little volatile oil is procurable, and a considerable quantity from such as have little odor, it would appear that the smell emitted by odorant vegetables is produced by its natural evaporation.

Volatile oil is odorous, sapid, and pungent. It is for the most part liquid, even in low temperatures, though some congeal in moderate degrees of cold, and others are concrete in the ordinary temperatures. It dissolves sparingly in water; to which it communicates its peculiar odor, taste, and pungency; as likewise to alcohol and proof spirits, in which it is more abundantly soluble. Both these solutions are usually accomplished by distillation, but may likewise be formed by other means. That with water is called, in pharmacy, simple distilled water, or merely water of the peculiar vegetable; with proof-spirit or alcohol, it gets the name of compound distilled water, or spirit of the vegetable; when in large quantity, combined with alcohol, it is denominated essence or quintessence, and is then more readily soluble in water, and in larger proportion.

Exposed to the air, volatile oils gradually lose their peculiar odors, are thickened, and finally become concrete, resembling resins; often depositing acid crystals, and sometimes granules resembling camphor. By moderate heat, they are volatilised without change; but are partially decomposed by greater heat than is necessary for distillation. Heated in contact with air, they are more volatile, more readily inflammable, and produce more water in combustion, than fixed oils, and consequently contain a larger proportion of hydrogen. By the acids, they are oxidated, becoming black with sulphuric acid. Nitric acid, especially when mixed with sulphuric, readily sets them on fire. Dilute nitric acid, and oxymuriatic, convert them into resinous sub-

stances by oxidation. They combine with, or dissolve, sulphur, phosphorus, resin, and camphor; but combine difficultly and sparingly with the alkalies. By sugar, mucilage, and some other vegetable products, they are rendered miscible with water, in the state of emulsion. Previously united with alcohol, into what has been called essence, they are considerably soluble in water. Their ultimate elements seem the same with those of fixed oils.

Many of the essential oils being dear, it is very common to adulterate them several ways, to render them cheaper. These several ways seem reducible to three general kinds, each of which has its proper method of detection, viz. 1st, With expressed oils; 2dly, With alcohol; and, 3dly, With cheaper essential oils. If an essential oil be adulterated with an expressed oil, it is easy to discover the fraud, by adding a little spirit of wine to a few drops of the suspected essential oil, and shaking them together; for the spirit will dissolve all the oil that is essential, or procured by distillation, and leave all the expressed oil, that was mixed with it, untouched. If an essential oil be adulterated with alcohol, or rectified spirit of wine, it may be done in proportion, up to that of an equal quantity, without being easily discoverable either by the smell or taste: the way to discover this fraud is to put a few drops of the oil into a glass of fair water; and, if the oil be adulterated with spirit, the water will immediately turn milky, and, by continuing to shake the glass, the whole quantity of spirit will be absorbed by the water and leave the oil pure at top. Finally, if an essential oil be adulterated by a cheaper essential oil, this is commonly done very artfully; the method is to put fir-wood, turpentine, or oil of turpentine, into the still, along with the herbs to be distilled for their oil, such as rosemary, lavender, origanum, &c., and by these means the oil of turpentine distilled from these ingredients comes over in great quantity, and intimately blended with the oil of the genuine ingredient. The oils thus adulterated always discover themselves in time, by their own flavor being overpowered by the turpentine smell; but the ready way to detect the fraud is to drench a piece of rag, or paper, in the oil, and hold it before the fire; for thus the grateful flavor of the plant will fly off, and leave the naked turpentine scent behind.

The next class of oils are those made by infusion or decoction, wherein the virtues of some herb or flower are drawn out in the oil; as the oils of roses, chamomile, hypericum, alder, &c. However, these require to be differently treated: thus, for the scented flowers, particularly roses, insolation does best; because much boiling would exhale their more fragrant parts; but oils impregnated with green herbs, as those of chamomile and alder, require long boiling, before they receive the green color desired. In general no oils will bear to be boiled any longer than there remains some aqueous humidity, without turning black. There are many compound oils prepared in the same manner, viz. by boiling and insolation, and then straining off the oil for use. The same contrivance has likewise its use in making essences for the service of the per-

fumer; not only where essential oils cannot be well obtained in sufficient quantities, but also where they are too dear. The essential oil of jessamine flowers, honey-suckles, sweet-briar, damask roses, lilies of the valley, &c., are either extremely dear, or scarcely obtainable by distillation; and, in some of them, the odorous matter is so subtle as almost to be lost in the operation. But if these flowers be barely infused in fine oil of nuts, or oil of ben, drawn without heat and kept in a cool place, their subtle odorous matter will thus pass into the oil, and richly impregnate it with their flavor. And these essences may be rendered still more perfect by straining off the oil at first put on, and letting it stand again without heat, upon fresh flowers; repeating the operation twice or thrice.

Drying oils are formed of linseed oil, prepared by means of boiling, sometimes with and sometimes without the addition of other substances. Those commonly added to oil, in this preparation, are white vitriol, sugar of lead, seed-lac, gum mastic, gum sandarac, gum anise, gum copal, umbre, colcothar, litharge, and red-lead. A drying oil for the nicer works may be prepared by boiling two ounces of gum sandarac; white vitriol, and sugar of lead, of each one ounce; in a pint of nut or poppy oil, till the solid ingredients be dissolved, and the mixture becomes of the color of linseed oil. For coarser work, take one gallon of linseed oil, one pound of litharge of gold or silver, half a pound of white vitriol, and sugar of lead, gum arabic, and umbre, of each a quarter of a pound; boil them as long as the discoloring of the oil, which is the gradual consequence of boiling, will allow. That made for sale is prepared by boiling one gallon of linseed oil, and one pound and a half of red-lead, as long as the color will bear it. When the calxes of lead are united in small quantity with oil they diminish its fluidity, and dispose it to dry more readily. These oils are much used in painting, on account of their drying quality.

The following is a list of the plants which yield the fixed oils occurring usually in commerce:—

- | | |
|--|----------------------|
| 1. <i>Linum usitatissimum</i> | } Linseed oil. |
| et perenne | |
| 2. <i>Corylus avellana</i> | } Nut oil. |
| 3. <i>Juglans regia</i> | |
| 4. <i>Papaver somniferum</i> | Poppy oil. |
| 5. <i>Cannabis sativa</i> | Hemp oil. |
| 6. <i>Sesamum orientale</i> | Oil of sesamum. |
| 7. <i>Olea Europæa</i> | Olive oil. |
| 8. <i>Amygdalus communis</i> | Almond oil. |
| 9. <i>Gulandrin Mohrinza</i> | Oil of behen. |
| 10. <i>Cucurbita pepo et melapepo</i> | } Cucumber oil. |
| 11. <i>Fagus sylvatica</i> | |
| 12. <i>Sinapis nigra et arvensis</i> | } Oil of mustard. |
| 13. <i>Helianthus annuus et perennis</i> | |
| 14. <i>Brassica napus et campestris</i> | Rapeseed oil. |
| 15. <i>Ricinus communis</i> | Castor oil. |
| 16. <i>Nicotiana tabacum et rustica</i> | } Tobacco seed oil. |
| | |

17. *Prunus domestica* . . . Plum-kernel oil.
 18. *Vitis vinifera* . . . Grapeseed oil.
 19. *Theobroma cacao* . . . Butter of cacao.
 20. *Laurus nobilis* . . . Laurel oil.
 21. *Arachis hypogæa* . . . Ground-nut oil.

The following table contains a copious list of plants which yield volatile oils. The part of the plant from which it is extracted, and the English name of the oil, are added in separate columns.

| Plants. | Parts. | Oil of | Color. |
|--|--------------------|--------------------|-----------------|
| 1. <i>Artemisia absinthium</i> . . . | Leaves | Wormwood . . . | Green. |
| 2. <i>Acorus calamus</i> | Root | Sweet flag . . . | Yellow. |
| 3. <i>Myrtus pimenta</i> | Fruit | Jamaica pepper . | Yellow. |
| 4. <i>Anethum graveolens</i> . . . | Seeds | Dill | Yellow. |
| 5. <i>Angelica archangelica</i> . . . | Root | Angelica | |
| 6. <i>Pimpinella anisum</i> | Seeds | Anise | White. |
| 7. <i>Illicium an. atum</i> | Seeds | Stellat. anise . . | Brown. |
| 8. <i>Artemisia vulgaris</i> | Leaves | Mugwort | |
| 9. <i>Citrus aurantium</i> | Rind of the fruit | Bergamot | Yellow. |
| 10. <i>Meloleuca leucodendra</i> . . . | Leaves | Cajeput | Green. |
| 11. <i>Eugenia caryophyllata</i> . . . | Capsules | Cloves | Yellow. |
| 12. <i>Carum carui</i> | Seeds | Caraways | Yellow. |
| 13. <i>Amomum cardamomum</i> . . . | Seeds | Card-seeds . . . | Yellow. |
| 14. <i>Carlina acaulis</i> | Roots | | White. |
| 15. <i>Scandix chaerefolium</i> | Leaves | Chervil | Sulph. yellow. |
| 16. <i>Matricaria chamomilla</i> . . . | Petals | Chamomile . . . | Blue. |
| 17. <i>Laurus cinnamomum</i> | Bark | Cinnamon | Yellow. |
| 18. <i>Citrus medica</i> | Rind of the fruit | Lemons | Yellow. |
| 19. <i>Cochlearia officinalis</i> . . . | Leaves | Scurvy grass . . | Yellow. |
| 20. <i>Copaifera officinalis</i> | Extract | Copaiba | White. |
| 21. <i>Coriandrum sativum</i> | Seeds | Coriander seed . | White. |
| 22. <i>Crocus sativus</i> | Pistils | Saffron | Yellow. |
| 23. <i>Piper cubeba</i> | Seeds | Cubeb pepper . . | Yellow. |
| 24. <i>Laurus culilaban</i> | Bark | Culliban | Brown yellow. |
| 25. <i>Cuminum cymium</i> | Seeds | Cummi | Yellow. |
| 26. <i>Inula helenium</i> | Roots | Elecampane . . . | White. |
| 27. <i>Anethum feniculum</i> | Seeds | Fennel | White. |
| 28. <i>Croton eleutheria</i> | Bark | Cascarilla . . . | Yellow. |
| 29. <i>Maranta galanga</i> | Roots | Galanga | Yellow. |
| 30. <i>Hyssopus officinalis</i> | Leaves | Hyssop | Yellow. |
| 31. <i>Juniperus communis</i> | Seeds | Juniper | Green. |
| 32. <i>Lavendula spica</i> | Flowers | Lavender | Yellow. |
| 33. <i>Laurus nobilis</i> | Berries | Laurel | Brownish. |
| 34. <i>Prunus laurocerasus</i> | Leaves | Laurocerasus . . | |
| 35. <i>Levisticum logisticum</i> . . . | Roots | Loveage | Yellow. |
| 36. <i>Myristica moschata</i> | Seeds | Mace | Yellow. |
| 37. <i>Origanum majorana</i> | Leaves | Marjoram | Yellow. |
| 38. <i>Pistacia lentiscus</i> | Resin | Mastic | Yellow. |
| 39. <i>Matricaria parthenium</i> . . . | Plant | Motherwort . . . | Blue. |
| 40. <i>Melissa officinalis</i> | Leaves | Balm | White. |
| 41. <i>Mentha crispæ</i> | Leaves | | White. |
| 42. <i>Mentha piperitis</i> | Leaves | Peppermint . . . | Yellow. |
| 43. <i>Achillea millefolium</i> | Flowers | Millefoil | Blue and green. |
| 44. <i>Citrus aurantium</i> | Leaves | Neroli | Orange. |
| 45. <i>Origanum creticum</i> | Flowers | Spanish hop . . . | Brown. |
| 46. <i>Apium petroselinum</i> | Roots | Parsley | Yellow. |
| 47. <i>Pinus sylvestris et abies</i> . . . | Wood and resin . | Turpentine . . . | Colorless. |
| 48. <i>Piper nigrum</i> | Seeds | Pepper | Yellow. |
| 49. <i>Rosmarinus officinalis</i> | Plant | Rosemary | Colorless. |
| 50. <i>Mentha pulegium</i> | Flowers | Pennyroyal . . . | Yellow. |
| 51. <i>Genista canariensis</i> | Rhodium | Rhodium | Yellow. |
| 52. <i>Rosa centifolia</i> | Petals | Roses | Colorless. |
| 53. <i>Ruta graveolens</i> | Leaves | Rue | Yellow. |
| 54. <i>Juniperus sabina</i> | Leaves | Savine | Yellow. |
| 55. <i>Salvia officinalis</i> | Leaves | Sage | Green. |
| 56. <i>Santalum album</i> | Wood | Santalum | Yellow. |
| 57. <i>Laurus sassafras</i> | Root | Sassafras | Yellow. |
| 58. <i>Satureia hortensis</i> | Leaves | Satureia | Yellow. |
| 59. <i>Thymus serpyllum</i> | Leaves and flowers | Thyme | Yellow. |
| 60. <i>Valeriana officinalis</i> | Root | Valerian | Green. |
| 61. <i>Kæmpferia rotunda</i> | Root | Zedoary | Greenish blue. |
| 62. <i>Amomum zinziber</i> | Root | Ginger | Yellow. |
| 63. <i>Andropogon schænanthum</i> . . . | | Sira | Brown. |

TABLE OF VOLATILE OILS.

| Names. | Color. | Specific Gravity. | Consistency at 60°. Freezes at 14°. | Odor. |
|---------------------|---------|-------------------|-------------------------------------|----------------------------|
| Turpentine | None. | .792 | Fluid as water. | Strong. |
| Juniper | Green. | .611 | Very fluid. | Strong smell. |
| Rosemary | None. | .934 | Thin liquid. | Like the plant. |
| Mint | None. | .975 | Very fluid. | Agreeable. |
| Cloves | None. | 1.034 | Oily and very fluid. | Very fragrant. |
| Lemon | Yellow. | | Thin liquid. | Very agreeable. |
| Orange | Yellow. | .888 | Ditto. | Nearly similar. |
| Cinnamon | Yellow. | 1.035 | Oily and less liquid. | Pleasant. |
| Sassafras | None. | 1.094 | Oily. | Like the root. |
| Fennel | | .997 | Becomes solid at 50°. | |
| Tansy | | .946 | | Very strong. |
| Dill | | .994 | | |
| Caraway | None. | .94 | | Very strong and pungent. |
| Penny Royal | | .978 | | Agreeable, like the plant. |
| Cummin | | .975 | | |
| Nutmegs | None. | .948 | Like butter. | Very pleasant. |
| Aniseed | None. | | Becomes solid at 50°. | Very strong. |
| Thyme | Brown. | | Crystallises. | Like camphor. |
| Spike | Yellow. | .936 | | Very strong. |
| Lavender | None. | | Thin liquid. | Very agreeable. |
| Origanum | | .94 | | Very strong and acrid. |
| Wormwood | Green. | | | |
| Camomile | Blue. | | | |
| Hops | Green. | | Like butter. | Like the flower. |
| Parsley | Green. | | | |
| Bergamotte | Yellow. | | Not oily. Is solid at 23°. | Very pleasant. |
| Cardamom | None. | | Oily. | |
| Mace | | | Oily. | Agreeable. |
| Roses | None. | | | |
| Peppermint | Green. | | Thin liquid. | Very agreeable. |
| Savine | | | | Disagreeable. |
| Pepper | None. | | Like butter. | Very acrid. |

Several of the gum-resins, as myrrh and galbanum, yield an essential oil; and likewise the balsams, as benzoin, &c.

OIL, WHALE. See WHALE and BALANCE.

OILY PALM. See RICINUS.

OINT, *v. a.* } *Fr. oint*; of Lat. *unguo*,
OINTMENT, *n. s.* } *unctio*. To bedew or cover
with oil; to anoint (the more common word):
ointment is, unctuous matter more or less fluid;
unguent; salve.

There n'as quicksilver, litarge, ne brimston

Boras, cerus, ne oile of tartre non;

Ne ointment that wolde clense or bite,

That him might helpen of his whelkes white.

Chaucer.

Life and long health that gracious ointment gave,
And deadly wounds could heal, and rear again
The senseless corpse appointed for the grave.

Spenser.

They oint their naked limbs with mothered oil,

Or from the founts where living sulphurs boil

They mix a med'cine to foment their limbs.

Dryden.

Ismarus was not wanting to the war,

Directing ointed arrows from afar;

And death with poison armed. *Id. Æneid.*

OISE, DEPARTMENT OF THE, France, formed out of part of Beauvoisis and part of Valois, a small country once dependent on the province of the Isle of France, and taking its name from the river Oise, which crosses the eastern part. The

principal place of this prefecture is Beauvais; it is divided into four arrondissements, Beauvais, containing. 127,533 inhabitants; Clermont 85,419; Compiègne 90,142; and Senlis 72,723; making a total population of 375,817 souls on a superficial extent of 2682 square miles, yielding a territorial revenue of 25,609,000 francs. It is part of the first military division, having a royal court at Amiens, and consisting of three electoral arrondissements, which send five members to the chamber of deputies. This department is bounded on the north by that of the Somme; on the east by that of the Aisne; on the south by those of Seine-et-Marne and Seine-et-Oise, and on the west by those of the Lower Seine and the Eure.

The face of the country is intersected with hills, well cultivated plains, and rather extensive forests, of which that of Compiègne is the most remarkable. The soil is generally good, and fruitful in corn of a good quality, most of which serves for the supply of Paris; the same may be said of the vegetables, which are excellent in some of the cantons. Great quantities of hemp and rape seed, and very fine fruits, are produced here. In some parts the vine is cultivated with much care; but in general the wine is poor. There are some good pastures for cattle and sheep, the flesh of which is greatly esteemed. The soil is a fat, rich earth, cultivated with

horses, and yielding an ample supply for its inhabitants; it contains 83,320 hectares of forests (oak and birch), and 3500 of vineyards; the average produce of the hectare of arable land being estimated at thirty-nine francs, eighty centimes. Besides what has been mentioned there is abundance of game, especially hares and rabbits; also excellent fresh water fish, horses, mules, asses, pigs, poultry, and many bees. There are quarries of gray marble, free stone, mill stones, paving stone and plaster; crucible clay, potters' clay, marle, and turf.

The manufactures consist of woollen stuffs, calicoes, Holland lawns, cambrics, blond, black and white lace, printed cottons, carpets, caps, gold and silver lace, whip handles, walking sticks, turnery, ivory goods, fans, mirrors, spectacles, ropes, agricultural implements, china, delf, sulphate of iron, cotton yarn, paper, leather, and boat building. There is also a royal manufactory of tapestry. A considerable trade is carried on in corn, flour, and all the above articles. The principal rivers that water this department are, the Oise, the Aisne, and the Ourcq, navigable; the Thérain, the Avelon, the Bresche, the Nonette; and it is crossed by the great roads of Paris, Amiens, Abbeville and Rouën.

Orse, a river in France, which rises near Sélagne, in the kingdom of the Netherlands, at a short distance from the frontiers of France. It soon enters the department of the Aisne, passes by Hirson, Etrée-au-Pont, Guise, Origny, Ribemont, la Fere, Chauny, Noyon, Compiègne, Pont St. Maxence, Creil, Beaumont, l'Isle Adam, and Pontoise, and falls into the Seine, at Conflans St. Honorine. It begins to be passable for floats at Butor, and navigable at Chauny. Its navigation is very important, as it connects the canal of St. Quentin, and all the northern canals, with the Seine. In its course, which is about 165 miles, it receives the waters of the Serre, the canal of Crozat, the Aine, the Bresche, the Nonette, and several other streams.

OISEL (James), a Dutch lawyer, born in 1631. He became professor of civil law at Groningen; and wrote a treatise on ancient brass coins, entitled *Thesaurus selectorum numismatum antiquorum ære expressorum*; and several other works. He died in 1686, aged fifty-five.

OKA, a large navigable river in the central part of Russia, in Europe, which rises in the government of Orel, flows north-east, and, after receiving the Moskva, joins the Wolgà at Niznei-Novgorod. It receives a number of small streams.

OKEHAM or OAKHAM, the county town of Rutland, situate in a rich valley called the vale of Catnose, sixteen miles E. N. E. from Leicester, ninety-five from London. It consists of two parishes or manors, called the lord's hold and the dean's hold, the former being under the earls of Winchelsea, who hold annual courts, at which parish officers, &c., are chosen, the latter under the dean of Westminster, who holds a triennial court. The church is a spacious structure dedicated to All Saints, with a native chancel, side aisles, and tower, terminated by a lofty spire. Its ancient castle has long been demolished, and the building now called the castle is the hall where the assizes

are held and the public business of the county transacted; the town is well built. There are some well endowed free schools and alms houses, and an hospital. The noble mansion of the earl of Winchelsea is in the neighbourhood, near Burleigh on the hill, and is an extensive and magnificent structure, built of free-stone.

OK'ER, *n. s.* Or OCHRE, which see. A color.

And Klaius taking from his younglings cark,

Lest greedy eyes to them might challenge lay,

Busy with *oker* did their shoulders mark. *Sidney.*

Red *oker* is one of the most heavy colours; yellow *oker* is not so, because it is clearer. *Dryden.*

OKEY HOLE, a celebrated natural cavern of England, on the south side of Mendip hills. The entrance is in the fall of those hills, beset all about with rocks, and has near it a precipitate descent of nearly twelve fathoms deep, at the bottom of which there continually issues from the rocks a considerable current of water. The naked rocks above the entrance are about thirty fathoms high, and the whole ascent of the hill above is about a mile, and very steep. As you pass into this vault, you go at first upon a level; but, advancing farther, the way is rocky and uneven, sometimes ascending, and, sometimes descending. The roof of this cavern, in the highest part, is about eight fathoms from the ground, but in many places it is so low that one must stoop to get along. The breadth is not less various than the height, for in some places it is five or six fathoms wide, and in others not more than one or two. It is in length about 200 yards. At the farthest part of the cavern there is a stream of water, large enough to drive a mill, which passes all along one side of the cavern, and at length slides down about six or eight fathoms among the rocks and then, pressing through the clefts, falls into the valley. The river within the cavern is well stored with eels, and has some trouts. In dry summers a great number of frogs are seen all along this cavern, even to the farthest part of it; and on the roof are vast numbers of bats.

OKHOTZK, one of the four circles of the government of Irkoutsk, Asiatic Russia. It is a maritime territory, extending along the seas of Okhotzk, of Kamtschatka, and of Anadir, and both barren and unwholesome from the excessive moisture and thick mists. About ten or twelve miles inland there is a ridge of hills, which, though of no great elevation, arrest the influence of the sea air; and beyond them the trees grow well, and the meadows are rich.

OKHOTZK, the capital of the above circle, is built upon a long and narrow ridge, between the sea and the river Okhota, and composed chiefly of an accumulation of debris. It is upwards of three miles long, but not more than from 100 to 300 feet broad. The town contains about 130 houses, which extend in a line two-thirds of a mile long. It has a church, magazines, and a double row of shops, and is supported by being the channel of trade between Irkoutsk and Kamtschatka. The goods are conveyed down the Lena to Yakoutsck, thence up the Aldane to its confluence with the Judoma, then up the Judoma, till a short land carriage conveys them to Okhotzk. The journey from Okhotzk to Irkoutsk

is performed more easily by descending the Judoma and Aldane. In the land part of the route the goods are placed on pack horses or men's backs, as there are no waggons of any description. It can be performed only in spring, to avoid the danger of sinking in morasses. Long. 142° 44' E., lat. 59° 20' N.

OKHOTZK, SEA OF, a gulf of the Eastern Ocean, between Kamtschatka, the circle of Okhotzk, part of Chinese Tartary, and Saghalien. In its opening into the ocean are the Kurile Islands and part of Jesso.

OLATRUS (Nicolas), a Hungarian divine and historian, born at Hermanstadt. He was made chancellor of Hungary and archbishop of Stugonira. He wrote, 1. A Chronicle of his own time; 2. A History of Attila; and 3. A Description of Hungary. He died in 1568.

OLAVIDES (Paul, A. J.), a Spanish statesman and modern victim of the inquisition, was born in 1725 at Lima in Peru, of wealthy parents. At an early age he was appointed auditor of the province; but having, by the liberality of his opinions, given offence to the monks and friars, they had him sent to Spain, where he was committed to prison by the holy office, but shortly after liberated. He now took up his residence at Madrid, and was appointed agent for his Peruvian countrymen. Powerfully seconding the measures of the Spanish minister, the count d'Aranda, for the expulsion of the Jesuits, at length the government appointed him intendant of Andalusia, where he founded a new colony, which flourished greatly. But, having endeavoured to exclude as much as possible the monastic and mendicant orders, they charged him with heresy; and in Nov. 1776 he was arrested and thrown a second time into the dungeons of the inquisition. After two years' confinement he was brought up to receive his sentence. It was charged against him that he had in his library the French Encyclopedie, Bayle's Dictionary, Montesquieu's Spirit of laws, and the works of Voltaire and Rousseau, together with a letter from that philosopher to himself, containing the phrase — 'It is much to be wished that Spain possessed forty such persons as yourself.' Olavides was condemned to eight years' seclusion in a monastery to practise exercises of piety, and to be afterwards banished twenty leagues from all great cities; to be incapable of public employment, &c. But he contrived to escape from the convent, and took refuge in France and Geneva. On the death of Charles III. he was permitted to return to France, where he resided at the revolution; and under the reign of terror was imprisoned at Orleans. He employed the period of his confinement, and his subsequent leisure, in writing The Triumph of the Gospel, a work which attracted notice in his own country, and was translated into French. Its success induced those who had persecuted him to boast of his conversion, and they obtained his recall to Spain. Thither he went in 1798, and retired to his estate in Andalusia, where he died in 1803.

OLAX, in botany, a genus of the monogynia order, triandria class of plants: CAL. entire: COR. funnel-shaped and trifid; the nectarium tetraphyllous.

OLD, *adj.*

OLD-FASHIONED, *adj.*

OLD'EN,

OLD'NESS, *n. s.*

Sax. *ealb*; Dan. *ælde*; Goth. *alda*; Teut. *alt*. Ancient; of long existence or continuance; of a specified duration or length of life; past the middle of life; not new, young, or modern; (in a burlesque sense) more than enough; 'of old,' signifies from ancient times: oldfashioned, obsolete, not a-la-mode: olden, the ancient plural of old, now used only in poetry: oldness, quality of being old; old age; antiquity.

Raiment waxed not *old* upon thee.

Deuteronomy.

Then said I unto her that was *old* in adulteries, will they now commit whoredoms with her?

Ezek. xxxiii. 43.

To *old* age, since you yourself aspire,
Let not *old* age disgrace my high desire.

Sidney.

These things they cancel, as having been instituted in regard of occasions peculiar to the times of *old*, and as being now superfluous.

Hooker.

Plead you to me, fair dame? I know you not:
In Ephesus I am but two hours *old*,
As strange unto your town as to your talk.

Shakespeare.

How *old* art thou?—Not so young, sir, to love a woman for singing; nor so *old*, to doat on her for any thing. I have years on my back forty-eight.

Id. King Lear.

Blood hath been shed ere now, i' the' olden time,
Ere human statute purged the general weal.

Shakespeare.

This policy and reverence of ages makes the world bitter to the best of our times; keeps our fortunes from us till our *oldness* cannot relish them.

Id. King Lear.

When Gardiner was sent over as ambassador into France, with great pomp, he spoke to an *old* acquaintance of his that came to take his leave of him.

Camden's Remains.

Any man that shall live to see thirty persons descended of his body alive together, and all above three years *old*, makes this feast, which is done at the cost of the state.

Bacon.

He did enfold

Within an ox hide, slayed at nine years *old*,

All the' airie blasts, that were of stormie kinds.

Chapman.

Equal society with them to hold,
Thou need'st not make new songs, but sing the *old*.

Cowley.

Whether such virtue spent of *old* now failed

More angels to create. *Milton's Paradise Lost.*

The Latian king, unless he shall submit,

Own his *old* promise, and his new forget,

Let him in arms the power of Turnus prove.

Dryden.

In days of *old* there lived of mighty fame,
A valiant prince, and Theseus was his name.

Id.

Some are offended that I turned these tales into modern English; because they look on Chaucer as a dry, *old-fashioned* wit, not worth reviving.

Id.

He that changes his condition, out of impatience and dissatisfaction, when he has tried a new one, wishes for his *old* again.

L'Estrange.

The Genoese are cunning, industrious, and inured to hardship; which was the character of the *old* Ligu-
riana.

Addison.

He is one of those *old-fashioned* men of wit and pleasure, that shews his parts by raillery on marriage.

Id.

An healthy *old* fellow, that is not a fool, is the happiest creature living. *Steele.*

He must live in danger of his house falling about his ears, and will find it cheaper to build it from the ground in a new form ; which may not be so convenient as the *old*. *Swift.*

'Tis greatly wise to know, before we're told,
The melancholy news that we grow *old*. *Young.*

And then no person should be permitted to kill characters but qualified *old* maids and disappointed widows. *Sheridan.*

Thou grow'st *old* rosy wine, but on earth what appears,
Whose virtues like thine still increase with its years. *Byron.*

Story, Lord bless you, I have none to tell, sir,
Only last night a drinking at the Chequers,
This poor *old* hat and breeches, as you see, were
Torn in a scuffle. *Canning.*

OLDCASTLE (Sir John), called the good lord Cobham, was born in the reign of Edward III., and was the first author, as well as the first martyr, among the English nobility : he obtained his peerage by marrying the heiress of that lord Cobham who with so much virtue and patriotism opposed the tyranny of Richard II. By his means the famous statute against provisors was revived, and guarded against by severe penalties ; he was one of the leaders of the reforming party ; was at great expense in procuring and disper-

sing copies of Wickliffe's writings among the people, as well as by maintaining a number of his disciples as itinerant preachers. In the reign of Henry IV. he commanded an army in France, and compelled the duke of Orleans to raise the siege of Paris. In that of Henry V. he was accused of heresy, the growth of which was attributed to his influence. Being a domestic in the king's court, the king delayed his prosecution, that he might reason with him himself ; but, not being able to reclaim him to the church of Rome, he in great displeasure resigned him to its censure. He was apprehended and condemned for heresy ; but, escaping from the tower, lay concealed for four years in Wales, until the rumor of a pretended conspiracy was raised against him, and a price set upon his head. He was at last seized, and executed in St. Giles's Fields ; being hung alive in chains upon a gallows, and burned by a fire placed underneath. He wrote Twelve Conclusions, addressed to the Parliament of England.

OLDENBURG, GRAND DUCHY OF. The dominions of the duke of Oldenburg include several portions of territory in the north-west of Germany. The chief of them is Oldenburg Proper, almost surrounded by Hanover, and extending north to the shores of the German Ocean.

| | Area. | Population. |
|---|-------|-------------|
| Oldenburg Proper includes the country of Delmenhorst with the lordships of Varel, Jever, and Kniphausen | 2250 | 178,000 |
| The principality of Eutin or Lubeck | 200 | 20,000 |
| The lordship of Berkenfeld | 170 | 20,000 |
| Total | 2620 | 218,000 |

This duchy is divided into seven circles, having each a court of justice : the majority of the inhabitants are Lutherans, and well educated. The revenue is £126,000, and the contingent army 2000.

Oldenburg Proper is entirely flat, and greatly resembles Holland, many parts of the coast requiring similar dikes to prevent inundation. Here, and near the banks of the rivers, the soil is rich, but in many others it is marshy or sandy, and yields but little that is valuable. The climate is of course moist. The chief rivers are the Weser, Hunte, and Delme. The only small lake is the Dummersee. The population are chiefly employed in attending to cattle and fishing, as the country seldom grows sufficient grain to supply the wants of the inhabitants. Its common produce is grain, hemp, flax, and hops ; and a great many horses and cattle are bred. These, together with butter and cheese, are the articles of export. Amber is sometimes found on its coast, and turf is dug from the moors.

OLDENBURG, the capital of this duchy, is situated on the river Hunte. It is fortified, and, including the suburbs, has a population of about 5000. The palace of the grand duke, with three churches, three hospitals, and an observatory, are its chief public buildings. There is also a gymnasium, and a seminary for the instruction of schoolmasters. The courts of justice and government offices are situated here. It has also soap-houses, tanneries, and sugar refineries ; but

its chief trade is in wood. Few manufacturing establishments are to be found in this duchy ; and the linen, yarn, and stockings, that are made are produced by the peasants during the intervals of their other occupations. The illustrious house of Oldenburg have been allied to almost all the regal families of Europe.

OLDENBURG (Henry), a learned German, in the seventeenth century, descended from the ancient earls of Oldenburg in Westphalia. He was born in the duchy of Bremen ; and during the long parliament, in king Charles I. time, was appointed consul for his countrymen at London, after the usurpation of Cromwell : but, being discharged from that office, he was made tutor to lord Henry O'Bryan, an Irish nobleman, whom he attended to the university of Oxford, where he was admitted to study in the Bodleian library, in 1656. He was afterwards tutor to William lord Cavendish, and was acquainted with Milton the poet. During his residence at Oxford he became also acquainted with the members of that body there, who gave birth to the royal society ; upon the foundation of which he was elected fellow, and was chosen assistant secretary to Dr. Wilkins. He began the publication of the Philosophical Transactions in 1664 ; and held a correspondence with more than seventy learned persons, upon a vast variety of subjects, in different parts of the world. He was a constant correspondent of Mr. Robert Boyle, with whom he had a very intimate friendship ; and

translated several of his works into Latin. He continued to publish the Transactions, to No. XXXVI. June 25th, 1677; after which they were discontinued till January, 1678, when his successor in office, Mr. Nehemiah Grew, resumed and carried on the work. Mr. Oldenburg died at Charleton, near Greenwich, in August, 1678.

OLDENLANDIA, in botany, a genus of the monogynia order, and tetandria class of plants; natural order forty-seventh, stellatæ: the empalement of the flower is permanent, sitting upon the germen: the flower has four oval petals, which spread open, and four stamina, terminated by small summits; it has a roundish germen, situated under the flower, crowned by an indented stigma; the germen afterwards turns to a globular capsule, with two cells filled with small seeds. We have but one species of this plant in the English gardens; but Linnæus enumerates six.

OLDERMAN (John), a learned German, born in Saxony in 1686. He studied at Helmstadt, and became professor of Greek in that university in 1717. He wrote several learned dissertations, 1. *De Imperfectione Sermonis humani*; 2. *De Phraate Fluvio*, &c. He died at Helmstadt in 1723.

OLDHAM (John), an English poet in the seventeenth century, son of a nonconformist minister, was educated under his father, and then sent to Edmund Hall in Oxford. He became usher to the free-school at Croydon in Surry, and was afterwards private tutor for a considerable time. Having saved a little money, he went to London, and became acquainted with Dryden, Rochester, and the wits of his time. He lived mostly with the earl of Kingston at Holme-Pierpoint in Nottinghamshire, where he died of the small-pox in 1683, in his thirtieth year. His works chiefly consist of satires, odes, translations, paraphrases of Horace, &c., elegiac verses, imitations, parodies, familiar epistles, &c.

OLD HEAD, a cape of Ireland, in Cork, Munster, four miles south of Kinsale; it runs far into the sea, and has a light-house. A mile from its extremity was an ancient castle of the lords of Kinsale, built from one side of the isthmus to the other, which defended all the lands towards the head: this place was formerly called Duncearna, and was the old seat of the Irish kings. The isthmus, by the working of the sea, was quite penetrated through, so as to form a stupendous arch, under which boats might pass from one bay to the other. Among the rocks of this coast there are aviaries of good hawks; also sea-eagles, ospreys, &c.

OLD MAN OF THE MOUNTAIN. See ASSASSINS.

OLDYS (William), esq., Norroy king at arms, and an eminent antiquary, was born in 1687. He was a good historian, a correct writer, and well versed in English antiquities. He wrote, 1. *The British Librarian*, 8vo. 1737; 2. *The Life of Sir Walter Raleigh*, prefixed to his History of the World; 3. *Various Lives in Biographia Britannica*. He died in London April 15th, 1761. The following anagram is in one of his MSS. :—

In word and WILL I AM a friend to you,
And one friend OLD is worth a hundred new.

OLEA, in botany, the olive-tree, a genus of the monogynia order, and diandria class of plants: natural order forty-fourth, sepaliæ: cor. quadrifid, with the segments nearly ovate. The fruit is a monospermous plum. There are three species :—

1. *O. Capensis*, the Cape box-leaved olive, rises with shrubby stems, branching numerously from the bottom, six or seven feet high; small, oval, thick, stiff, shining leaves; and at the axillas small clusters of whitish flowers, succeeded by small fruit of inferior value.

2. *O. Europea*, the common olive-tree, rises with upright solid stems, branching numerously on every side, twenty or thirty feet high; spear-shaped, stiff, opposite leaves, two or three inches long, and half an inch or more broad; and at the axillas small clusters of white flowers, succeeded by oval fruit. This species is the principal sort cultivated for its fruit, the varieties of which are numerous, varying in size, color, and quality. It is a native of the southern warm parts of Europe, and is cultivated in great quantities in the south of France, Italy, and Portugal, for the fruit, to make olive oil, which is in great repute, and is transported to all parts, to the great advantage of those countries where the trees grow in the open ground: the green fruit is also in much esteem for pickling. Olive trees are easily propagated by shoots, which, when care has been taken to ingraft them properly, bear fruit in eight or ten years. Those kinds which produce the purest oil, and bear the greatest quantity of fruit, are ingrafted on the stocks of inferior kinds. Different names are given by the French to the varieties of the olive tree; and of these they reckon nineteen, whilst in Florence are cultivated no fewer than thirty-two. Olive shoots are ingrafted when in flower. If the operation has been delayed, and the tree bears fruit, it is thought sufficient to take off a ring of bark, two fingers breadth in extent, above the highest graff. In that case the branches do not decay the first year; they afford nourishment to the fruit, and are not lopped off till the following spring. Olive trees are commonly planted in the form of a quincunx, and in rows at a considerable distance from one another. Between the rows it is usual to plant vines, or to sow some kind of grain. It is observed that olives, like many other fruit trees, bear well only once in two years. The whole art of dressing these trees consists in removing the superfluous wood; for it is remarked that trees loaded with too much wood produce neither so much fruit nor of so good a quality. Their propagation in England is commonly by layers. The laying is performed on the young branches in spring. Give plenty of water all summer, and they will sometimes be rooted and fit for potting off in autumn; but sometimes they require two summers to be rooted effectually. When, however, they are properly rooted, take them off early in autumn, and pot them separately; give water, and place them in the shade till they have taken fresh root; and in October remove them into the green-house, &c. Those you intend to plant in the open ground should be kept in pots, to have occasional shelter of a garden-frame, two

or three years, till they have acquired some size, and are hardened to the full air; then transplant them into a warm border against a wall; mulch their roots in winter, and mat their tops in frosty weather. Olives have an acrid bitter, extremely disagreeable taste: pickled they prove less disagreeable. The Lucca olives, which are smaller than the others, have the weakest taste; the Spanish, or larger, the strongest; the Provence, which are of a middling size, are generally the most esteemed. When olives are intended for preservation they are gathered before they are ripe. The art of preparing them consists in removing their bitterness, in preserving them green, and in impregnating them with a brine of aromatised sea-salt, which gives them an agreeable taste. For this purpose different methods are employed. Formerly they used a mixture of one pound of quicklime with six pounds of newly sifted wood-ashes; but of late, instead of the ashes, they employ nothing but a lye. This softens the olives, makes them more agreeable to the taste, and less hurtful to the constitution. In some parts of Provence, after the olives have lain some time in the brine, they remove them, take out the kernel, and put a caper in its place. These olives they preserve in excellent oil; and, when thus prepared, they strongly stimulate the appetite in winter. Olives perfectly ripe are soft, and of a dark red color. They are then eaten without any preparation, excepting only a seasoning of pepper, salt, and oil; for they are extremely tart, bitter, and corrosive. Great drought, as well as much rain, is extremely injurious to the crop of olives. This fruit is much exposed to the attacks of a worm peculiar to itself, and which injures it so much that, after the olives are gathered, the produce of the oil extracted from them is diminished one half.—The wood of the olive tree is beautifully veined, and has a pretty agreeable smell: it is in great esteem with cabinet-makers, on account of the fine polish which it takes. It is of a resinous nature, and consequently excellent for burning. As the laurel branch is the symbol of glory, so the olive branch covered with leaves has, from the most ancient times, been the emblem of concord, the symbol of friendship and peace. The leaves of olive trees have an astringent quality. Many people use them in making gargles for inflammations of the throat. These plants in this country must be kept principally in pots, for moving to the shelter of a green-house in winter; for they are too tender to prosper in the open ground in this climate, though sometimes they are planted against a warm south wall, and sheltered occasionally from frost in winter by mulching the roots, and matting their tops; whereby they may be preserved, and will sometimes produce fruit for pickling. A very severe winter, however, often kills or greatly injures their young branches; therefore let the principal part be potted in rich earth, and placed among the green-house shrubs, and managed as others of that kind. These trees are often sent over from Italy to the Italian warehouses in London, along with orange trees, &c., where pretty large plants may be purchased reasonably, which should be managed as direct-

ed for orange trees that are imported from the same country. See CITRUS.

OLEAG'INOUS, *adj.* } Lat. *oleaginus*. Oily;
OLEAG'INOUSSNESS, *n. s.* } unctuous.

In speaking of the *oleaginousness* of urinous spirits, I employ the word most rather than all. *Boyle*.

The sap, when it first enters the root, is earthy, watery, poor, and scarce *oleaginous*. *Arbutnot.*

OLEARIUS (Adam), minister to the duke of Holstein, and secretary to the embassy sent in 1633 to the great duke of Muscovy and to the king of Persia. He spent six years in this employment; and, on his return, published a relation of his journeys, with maps and figures, at Sleswick, 1656, in folio. He wrote an Abridgement of the Chronicles of Holstein from 1448 to 1663: and was appointed librarian to the duke of Holstein, in which capacity he probably died. He has the character of an able mathematician, an adept in music, and a good orientalist, especially in the Persian language.

OLEARIUS (Godfrey), son of Godfrey Olearius, D. D., superintendent of Halle in Saxony, was born there in 1639. He became professor of Greek at Leipsic. He discharged the most important posts in the university, and, among other dignities, was ten times rector of it. His learning and industry were displayed in 106 theological disputations, sixty-one in philosophy, some programmas upon difficult points, several speeches and theological councils; which make two thick volumes; besides his Moral Theology, his Introduction to Theology which treats of cases of conscience, and his Hermeneutica Sacra. He died in 1713.

OLEARIUS (Godfrey), eldest son of the above, was a man of genius and learning, a professor in the same university, and published several works; but died young of a consumption before his father.

O'LEARY (Rev. Arthur), an eminent Irish Roman Catholic divine, born at Cork in 1729. He was a Dominican friar, and preached in his friary in Cork for many years. As a public author he ranks high in the literary world. Sir Lucius O'Brien compared him to Ganganelli. He wrote, 1. A Defence of the Divinity of Christ and the Immortality of the Soul (Cork, 1784); in a series of letters to the author of a profane work, entitled Thoughts on Nature and Religion, by Michael Servetus, but which was the impious effusion of a physician in Cork, whom O'Leary exposed to merited contempt. 2. Loyalty Asserted. 3. An Essay on Toleration. 4. Letters to Mr. John Wesley. 5. A Defence of his Conduct and Writings, during the Disturbances in Munster, in answer to Dr. Woodward, bishop of Cloyne, and Mr. Trant, who wrote under the signature of Theophilus; 1781. In this piece, on the topic of purgatory, he recommended a truce, as being a proposition that could neither be demonstratively supported nor disproved; and therefore his lordship should take the thing as he found it, as it is possible 'he may go farther and fare worse.' He was a man of great urbanity of manners: in his writings he was pleasant, humorous, and energetic. He died at London, January 8th, 1802, aged seventy-three.

OLEASTER, *n. s.* Latin *oleaster*. A species of wild olive.

OLEFIANT GAS. See **CHEMISTRY**. Index.

OLEIC ACID. When potash and hog's lard are saponified, the margarate of the alkali separates in the form of a pearly looking solid, while the fluid fat remains in solution, combined with the potash. When the alkali is separated by tartaric acid the oily principle of fat is obtained, which Mr. Chevreul purifies by saponifying it again and again, recovering it two or three times; by which means the whole of the margarine is separated. As this oil has the property of saturating bases, and forming neutral compounds, he has called it oleic acid. In his sixth memoir he gives the following table of results:—

| | | |
|------------------------------|------------|-------|
| 100 Oleic acid of human fat. | | |
| Saturate Barytes. | Strontian. | Lead. |
| 26-00 | 19-41 | 82-48 |
| 100 Oleic acid of sheep fat. | | |
| 26-77 | 19-38 | 81-81 |
| 100 Oleic acid of ox fat. | | |
| 28-93 | 19-41 | 81-81 |
| 100 Oleic acid of goose fat. | | |
| 26-77 | 19-38 | 81-34 |
| 100 Oleic acid of hog fat. | | |
| 27-00 | 29-38 | 81-80 |

Oleic acid is an oily fluid without taste and smell. Its specific gravity is 0-914. It is generally soluble in its own weight of boiling alcohol, of the specific gravity of 0-7952; but some of the varieties are still more soluble. 100 of the oleic acid saturate 16-58 of potash, 10-11 of soda, 7-52 of magnesia, 14-83 of zinc, and 13-93 peroxide of copper.

OLENUS, or **OLEN**, a Greek poet, older than Orpheus, born at Xanthe, a city of Lycia. He composed several hymns, which were sung in the island at Delos upon festival days. Olenus is said to have been one of the founders of the oracle of Delphi; to have been the first who filled at that place the office of priest of Apollo; and to have given responses in verse.

OLEOSE, *adj.* Latin *oleosus*. Oily.

Rain water may be endued with some vegetating or prolific virtue, derived from some saline or *oleose* particles it contains. *Bacon.*

In falcons is a small quantity of gall, the *oleous* parts of the chyle being spent on the fat.

Floyer on the Humours.

OLERON, ISLAND OF, France, on the coast of the Atlantic Ocean, opposite to the mouths of the Sendre and the Charente, at about three miles from the continent. It is eighteen miles long, six broad, and forty-eight in circumference, and forms part of the department of the Lower Charente, making two cantons of the arrondissement of Marennnes. It is fertile in corn, maize, beans, wood, red and white wine, and excellent vegetables. There are here numerous marshes, which furnish a beautifully white salt. This island contains the little towns of Chateau Ile, and St. Pierre d'Oleron, the boroughs of St. Denis, Dolus, St. George's, St. Trojan, and several villages, including a population of about 15,000. It is crossed from south to north, throughout almost its whole extent, by a great road, which terminates at the tower of Chasseron, an elevated lighthouse on the northern extremity

of the island. There are here brandy distilleries and dock-yards; and a considerable trade is carried on in grain, salt, wines, and brandy.

OLERON, SEA LAWS OF, certain laws relative to maritime affairs, made by king Richard I. when he was at the island of Oleron. These laws, being accounted the most excellent sea laws in the world, are recorded in the Black Book of the admiralty; and are the foundation of the maritime laws of most states in Europe. See Selden's *Mare Clausum*. See **MARITIME**.

OLEUM PALMÆ CHRISTI, commonly called castor oil, is extracted from the kernel of the fruit produced by the *Ricinus Americanus*. See **RICINUS**. This oil is much used as a purgative in medicine. It acts gently on the bowels, with little or no irritation. By many physicians it has been deemed a sovereign remedy in bilious, calculous, and nephritic complaints; but its taste is extremely nauseous, and, when frequently used, it is apt to relax the tone of the bowels. It is recommended to be given in clysters; and Dr. Canvane of Bath affirms, that when children cannot be made to swallow any medicine, if the navel and hypochondria be rubbed with this oil, it will produce one or two physical stools. He adds that in small draughts, or by clyster, or by embrocation, it is an excellent vermifuge.

OLFACT, *v. a.* } Latin *olfactus*. To smell;

OLFACTORY, *adj.* } used only, as we find, in burlesque: olfactory, having or pertaining to the sense of smell.

There is a Machiavelian plot,

Tho' every nare olfact it not. *Hudibras.*

EFFLUVIA, or invisible particles that come from bodies at a distance, immediately affect the olfactory nerves. *Locke.*

OLGA, the queen of Igor, the second monarch of Russia, who flourished about A. D. 880, having succeeded his father Ruric, who died in 878. Olga was born in Plescow, and was of the best family in that city. She bore him one son, called Swetoflaw. Igor being murdered by the Drewenses, or Drewliani, Olga revenged his death. She went afterwards to Constantinople, where she was baptised by the name of Helena. The emperor, John Zimisces, was her god-father, and fell in love with her; but she, alleging their spiritual alliance, refused to marry him. Her example made some impression upon her subjects, many of whom became converts to Christianity; but none upon her son, who reigned for a long time after her death, which happened at Pereslaw, in the eightieth year of her age, fourteen years after her baptism. The Russians rank her among their saints, and keep her festival on the 11th of July.

OLIBANUM, in pharmacy, a gummy resin, the product of the juniperus lycia Linnæi, brought from Turkey and the East Indies, usually in drops or tears like those of mastich, but larger; of a pale yellowish, and sometimes reddish color; a moderately warm pungent taste, and a strong, not very agreeable smell. This drug has received many different appellations, according to its different appearances; the single tears are called simply olibanum, or thus; when two are joined together, they have been called thus masculum, and, when very large,

thus *fœmininum*: sometimes four or five, about the bigness of filberts, are found adhering to a piece of the bark of the tree from which they exuded; these have been named thus *corticolum*; the finer powder which rubs off from the tears in the carriage, mica-thuris; and the coarser powder, manna thuris. This drug is not however, in any of its states, what is now called thus or frankincense in the shops. *Olibanum* consists of about equal parts of a gummy and resinous substance; the first soluble in water, the other in rectified spirit. With regard to its virtues, abundance have been attributed to it, particularly in disorders of the head and breast, in hæmoptoes, and in alvine and uterine fluxes: but its real effects in these cases are far from answering the promises of the recommenders. Riverius is said to have had large experience of the good effects of this drug in pleurisies, especially epidemic ones; he directs a scooped apple to be filled with a dram of *olibanum*, then covered and roasted under the ashes; this is to be taken for a dose, three ounces of *carduus* water after it, and the patient covered up warm in bed; in a short time, he says, either a plentiful sweat, or a gentle diarrhoea ensues, which carries off the disease. Geoffroy says, that he has frequently made use of this medicine after venesection, with good success.

OLID, adj. } Lat. *olidus*. Unsavory of
OLIDOUS. } smell; stinking; fœtid.

In a civet cat a different and offensive odour proceeds, partly from its food, that being especially fish, whereof this humour may be a garous excretion and *olideous* separation. *Brown.*

The fixt salt would have been not unlike that of men's urine; of which *olid* and despicable liquor I chose to make an instance, because chemists are not wont to take care for extracting the fixt salt of it. *Boyle.*

OLIFANT'S RIVER, a fine river of the district of Drakenstein, in the settlement of the Cape of Good Hope, falling into the Atlantic 200 miles north of Cape Town. The fertile valley through which it flows, between the ranges of the Bokkeveld, forms one of the divisions of Stellenbosch.

OLIGARCHY, n. s. Gr. *ολιγαρχία*. Government by a few persons; aristocracy.

The worst kind of *oligarchy* is, when men are governed indeed by a few, and yet are not taught to know what those few be whom they should obey. *Sidney.*

We have no aristocracies but in contemplation; all *oligarchies*, wherein a few men domineer, do what they list. *Burton.*

After the expedition into Sicily, the Athenians chose four hundred men for administration of affairs, who became a body of tyrants, and were called an *oligarchy*, or tyranny of the few; under which hateful denomination they were soon after deposed. *Swift.*

OLIO, n. s. Span. and Ital. *olla*. See **OGLIO**. A mixture or medley.

Ben Jonson, in his *Sejanus* and *Catiline*, has given us this *olio* of a play, this unnatural mixture of comedy and tragedy. *Dryden.*

I am in a very chaos to think I should so forget myself. But I have such an *olio* of affairs, I know not what to do. *Congreve.*

OLITORY, n. s. Lat. *olitor*. Pertaining to the kitchen garden.

Gather your *olitory* seeds. *Evelyn's Calendar.*

OLIVA (Alexander), a celebrated cardinal, and general of the Austin monks, was born at Saxoferato in 1408. He was admitted young among the Augustines, and studied at Rimini, Bologna, and Perugia; in which last university he was appointed professor of philosophy and divinity. He was successively chosen provincial, solicitor-general, vicar, and general of his order; and in 1460 was appointed a cardinal and bishop of Camerino by Pius II. He published, 1. *De Christi Ortu Sermones Centum*. 2. *De Cœna cum Apostolis Facta*. 3. *De Peccato in Spiritum Sanctum*. 4. *Orationes Elegantes*. He died at Tivoli in 1463.

OLIVA (John), a learned Italian, professor of morality at Azalo. He was patronised by Clement XI., and wrote some pieces, but his works are not interesting.

OLIVA, a sea-port town of Pomerania, on a bay of the Baltic; with a monastery; famous for a peace concluded in it between the emperor and the kings of Sweden and Poland in 1660. It is three miles, says Dr. Brookes, ten, says Mr. Crutwell, west of Dantzic. Long. 18° 29' E., lat. 54° 99' N.

OLIVA, a town of Spain, in Valencia.

OLIVARES, or **OLIVAREZ**, a town of Spain in Old Castile; eighteen miles south-east of Valladolid.

OLIVAREZ (Gasper de Guzman, count de), favorite and minister to Philip IV. of Spain; a man of great talents and boundless ambition. Philip no sooner became king than he became the subject of this his favorite. The king had abilities, but, whilst he spent his time in inactivity, the whole government was under the direction of Olivarez. The count, on the most plausible pretences, removed all such as he thought stood in his way, even to death, of which don Rodrigo Calderona was a melancholy instance, which excited universal compassion. By his imprudent conduct he provoked the resentment of the most powerful states, particularly England, France, and Holland, to conspire against Spain. Olivarez, however, never lost his credit; for, though Spain was put to the severest trials, it acquired a degree of fame which in the general opinion overbalanced its losses. Olivarez too was fortunate in making the peace; wherein he gained considerable advantage over Richelieu, so that things appeared to be still in a favorable train. But, in 1627, he again drew Spain into a war with Mantua, contrary to the sentiments of the wisest politicians; from which is justly dated its declension. He endeavoured to break the alliances of the duke of Mantua by various stratagems; but they did not succeed. He had soon after this another cause of mortification, on Richelieu (whom he considered as his enemy) being created a duke and peer of France, and admitted among the Venetian nobility. The people at length began to be displeased with his conduct; which in many instances was cruel and detestable. Spain, however, was so unusually successful, that the faults of the minister were overlooked for the

time; which rendered him more insolent and obstinate than ever. He had set his heart on the reduction of Casal in Italy, but the Spanish army was totally defeated. The revolt of the Catalans, whom he wished to deprive of their privileges, was the next consequence of his folly: he employed the Marquis de los Velez to quell this rebellion; but the cruelty of the measures used for this purpose only inflamed it the more. The revolution of Portugal, another disastrous event, was also the result of his obstinacy and rigor. The great secret, by which Olivarez had governed his master, was being the confidant of his pleasures. While he assumed a specious appearance of religion, he was not only immersed in vice himself, but encouraged it in his prince. Among other mistresses, he procured for him the fair actress Calderona. By this woman he had a son, named Don Juan of Austria, whom in the fourteenth year of his age he appointed generalissimo of the army against Portugal; while the heir apparent to the crown, Don Balthasar, was left under the tuition or custody of the countess of Olivarez; at which conduct the queen was chagrined, and the people enraged. His schemes now began to be defeated every where, and he fell under the displeasure of the emperor, the grandees, and the people all at once. His ill fortune did not, however, wholly overpower him; he was obliged to conceal himself, to avoid the rage of the populace; but he had still the confidence to publish an Apology for his conduct, which possessed a considerable share of wit and humor, tempered with spirited and masterly reasoning. This, however, did not prevent his being banished to Toro, where, worn out by infirmities, he died in 1645.

OLIVASTER, *adj.* Fr. *olivastre*. Darkly brown; tawny.

The countries of the Abyssenes, Barbary, and Peru, where they are tawny, *olivaster*, and pale, are generally more sandy. *Bacon*.

OLIVE, *n. s.* Fr. *olive*; Ital. *uliva*; Latin *olea*, *olea*. A tree yielding oil; the fruit of the tree; an ancient emblem of peace.

The seventh year thou shalt let it rest. In like manner thou shalt deal with thy vineyard, and olive yard. *Exod. s. xxiii. 11.*

To thee the heavens, in thy nativity,
Adjudget an olive branch and laurel crown,
As likely to be blest in peace and war.

Shakespeare.

In the purlieus of this forest stands

A sheepcote fenced about with olive trees. *Id.*

Their olive-bearing town. *Dryden's Æneid.*

It is laid out into a grove, a vineyard, and an allotment for olives and herbs. *Broomes.*

'The leaves are for the most part oblong and evergreen; the flower consists of one leaf, the lower part of which is hollowed, but the upper part is divided into four parts; the ovary, which is fixed in the centre of the flower cup becomes an oval, soft, pulpy fruit, abounding with a fat liquor, inclosing a hard rough stone.'

Miller.

OLIVE, in botany. See **OLEA**.

OLIVE, **WILD**. See **ELÆAGNUS**.

OLIVE OIL. The oil is undoubtedly that part of the produce of olive trees which is of greatest value. The quality of it depends on the nature

of the soil where the trees grow, on the kind of olive from which it is expressed, on the care which is taken in the gathering and pressing of the fruit, and likewise on the separation of the part to be extracted. Unripe olives give an intolerable bitterness to the oil; when they are over ripe the oil has an unguinous taste: it is therefore of importance to choose the true point of maturity. When the situation is favorable, those species of olives are cultivated which yield fine oils; otherwise they cultivate such species of trees as bear a great quantity of fruit, and they extract oil from it for the use of soaperies, and for lamps. They gather the olives about November or December. It is best to put them as soon as possible into baskets, or into bags made of wool or hair, and to press them immediately, to extract a fine oil. Those who make oil only for soaperies let them remain in heaps for some time in their storehouses; when afterwards pressed, they yield a much greater quantity of oil. Those, even, who extract oil to be used in food sometimes allow them to ferment in heaps, that they may have more oil; but this is extremely hurtful to the quality of the oil, and is the reason why fine oil is so very rare. M. Duhamel recommends not to mix sound olives with those in which a fermentation has already begun, the oil which is extracted being then of a bad quality and unfit for preservation. To have the oil in its purity, we must allow it to deposit its sediment, and then pour it off into another vessel. The oil extracted from the pulp only of olives is the most perfect which can be obtained, and will keep for several years; but that which is extracted from the kernel only, or from the nut, or from the whole olive, ground in the common way in public mills, has always more or fewer defects, loses its limpidity in a certain time, and is very apt to become rancid. Care must be taken likewise to keep it in proper vessels well shut. After all, in the course of time, olive oil loses its qualities, becomes disagreeable to the taste and smell, diminishes in fluidity, and at length thickens considerably. The refuse of the first pressing, when squeezed a second time, yields an oil, but thicker and less pure than the former. What remains after the second pressing, when mixed with a little water and placed in a pan over the fire, produces by pressure a third oil, but of a very inferior quality. What remains after all the oil is expressed is termed grignon, and is of no farther use but as fuel. The sediment, or fæces, of new oil we name, after the ancients, *amurca*; it is an excellent remedy in rheumatic affections. In Paris the wax used for shoes is commonly made of the dregs of defecated oil and smoke-black. Oil of olives is an ingredient in the composition of many balsams, ointments, plasters, mollifying and relaxing liniments. It is of an emollient and solvent nature; mitigates gripes, and the pains accompanying dysentery; and is one of the best remedies when one has chanced to swallow corrosive poisons: but it by no means prevents the fatal accidents which ensue from the bite of a snake, as has been pretended. It is an effectual cure, M. Bourgeois tells us, for the stings of wasps, bees, and other insects. A bandage soaked in the oil is immediately applied

to the sting, and a cure is obtained without inflammation or swelling. Olive oil is of no use in painting, because it never dries completely. The best soap is made of it, mixed with Alicante salt-wort and quick-lime.

OLIVE (Peter John), a French monk, was born in 1247, and died in 1297, aged fifty. After his death his body was dug up, and he was condemned as a heretic, for having advanced, in his writings, 'that the pope was the mystical antichrist; that St. Francis was the angel in the Revelations said to have the mark of the living God, and that his rule was the true gospel; that the perfect state of the church began with St. Francis; and that Christ and his apostles had no property, either in common or particular, but only the usufruct of what they enjoyed.'

OLIVENZA, or OLIVENÇA, a fortified town in the west of Spain, on the frontier of Estremadura, situated in a plain on a small river of this name, which falls into the Guadiana, nine miles north-east of the town, which belonged to Portugal until ceded to Spain at the treaty of Badajoz, in 1801. The congress of Vienna, in 1815, recommended its restoration, but without effect. The number of inhabitants is 4500. Fifteen miles south-east of Elvas, and forty-two south of Evora.

OLIVER (Isaac), an English painter, born in 1556, eminent both for history and portraits. Several of his miniatures are in the collections of our nobility and gentry. His drawings are finished to an extraordinary degree of perfection: many being copies after Parmegiano. Rubens and Vanduyck painted James I. after a miniature of Oliver's. He died in 1617.

OLIVER (Peter), the son and disciple of Isaac, was born in 1601. He arrived at a degree of perfection, in miniature portraits, superior to his father and all his contemporaries. In the collections of Charles I. and James II. there were thirteen historical subjects painted by this Oliver, of which seven are still preserved in the closet of queen Caroline at Kensington. He died in 1660.

OLIVER, a learned English Benedictine monk, born at Malmesbury, in the eleventh century. He invented artificial wings, but in attempting to fly with them from a high tower he fell and broke his leg. He died A.D. 1060.

OLIVER (William), M. D., an eminent English physician, who practised with success many years at Bath, and wrote a Treatise on the Virtues of the Bath Waters. He assisted the celebrated Nash in procuring the establishment of the Bath Hospital. He was during the greater part of his life a zealous infidel, but a short time before his death became a penitential convert to Christianity. He died in 1764.

OLIVER CROMWELL. See CROMWELL.

OLIVES, MOUNT OF. See OLIVET.

OLIVET, or MOUNT OF OLIVES, in ancient geography, was seated to the east of Jerusalem, and parted from it only by the brook Kedron and the valley of Jehoshaphat, which stretches out from north to south. It was upon this mount that Solomon, in his dotage, built temples to the gods of the Ammonites (1 Kings xi. 7), and of the Moabites, out of complaisance to his wives,

who were natives of these nations. Hence Mount Olivet is called the mountain of corruption (2 Kings xxiii. 13). Josephus says that this mountain is at the distance of five stadia or furlongs from Jerusalem, which make 625 geometrical paces, or the length of a Sabbath day's journey, says St. Luke (Acts i. 12). It had three summits, or was composed of three several mountains, ranged from north to south. The middle summit is said to be that whence our Saviour ascended into heaven. It was upon that towards the south that Solomon built temples to his idols. The summit which is most to the north is distant two furlongs from the middlemost. This is the highest of the three, and is commonly called Galilee. In the time of king Uzziah the mount of Olives was so shattered by an earthquake that half of the earth on the west fell down, and rolled four furlongs or 500 paces thence, towards the mountain which was opposite to it on the east, so that the earth blocked up the highways, and covered the king's gardens.

OLIVET (Joseph), a learned French writer, born in 1682. He entered early into the society of the Jesuits, but left it in 1715. He then went to Paris, where he became so eminent in literature that he was chosen a member of the French Academy. He published an excellent edition of Cicero's works in 9 vols. 4to. He wrote also *Histoire de l'Academie Françoise*, and several other works. He died in 1678.

OLIVETAN (Robert), a printer, related to Calvin, who printed at Neufchatel in 1535, in folio, a version of the Bible in French, the first which had been translated from the original Hebrew and Greek. It is written in an uncouth and barbarous style, and is far from being faithful. The characters in which it is printed are Gothic, and the language is no less so. It is valued only on account of its rarity and age. Olivetan survived his publication but a short time; for he was poisoned at Rome the year after, of which his translation is alleged to have been the cause. Olivetan's Bible, revised by John Calvin and N. Malingier, was reprinted at Geneva, in 1540, in 4to. This edition is still rarer than the former. It is called the Bible de l'Épée, because the printer had a sword in his sign.

OLIVEYRA (Francis Xavier de), a Portuguese knight of the order of Christ, was born at Lisbon in 1702, and at the age of fourteen admitted into a public office. In 1732 he went to Madrid, where his uncle held a diplomatic situation, and presented him to the king of Spain. He shortly after succeeded his father as secretary of embassy at Vienna; but having had a dispute with the count de Taronca, the ambassador, resigned his employment, and went to Holland in 1740. At Vienna the Lutherans had excited in his mind suspicions of the soundness of his Catholic faith, which he shows in *Memoirs of his Travels and Familiar Letters*, published in 1741 and 1742. These works were accordingly censured by the inquisition; while the author, having removed to England, made in 1746 an open profession of Protestantism. Here he published a *Pathetic Discourse* to his countrymen, on the

earthquake at Lisbon, and the following year a second discourse. In September 1762, being declared a heretic at an Auto-da-Fé, he was burnt in effigy, on which he published a book entitled *The Chevalier d'Oliveyra burnt in Effigy as a Heretic, why and wherefore? Anecdotes and Reflections on the subject laid before the Public by himself*. He died at Hackney in 1783, having written, besides the pieces above mentioned, a great number of MSS., including Oliveyriana, or Memoirs, historical and literary, 27 vols. 4to.

OLIVIER (Claude Matthew), advocate of the parliament of Aix, was born at Marseilles in 1701, and appeared at the bar with éclat. He had a chief hand in the establishment of the Academy of Marseilles, and was one of its original members. He possessed a quick and lively genius. He died in 1736, at the age of thirty-five. He published 1. *L'Histoire de Philippe roi de Macedoine, et pere d' Alexandre le Grand*, 2 vols. 12mo. 2. *Memoire sur les secours donnés aux Romains, par les Marseillois, pendant la 2de Guerre Punique*. 3. *Memoire sur les secours donnés aux Romains, par les Marseillois, durant la Guerre contre les Gaulois*.

OLIVIER (Guillaume Antoine), M. D., a modern French naturalist and traveller, was born near Frejus in 1756, and studied at Montpellier, where he received his diploma at the age of seventeen. Botany and entomology were his favorite pursuits: at the age of twenty-three he went to Paris to assist in the composition of a work on the natural history of that district. He was afterwards sent into England and Holland, to collect materials for a history of insects; and was employed on the entomological part of the *Encyclopedie Méthodique*. At the period of the revolution Olivier travelled to Persia with M. Bruguières, on a diplomatic mission planned by the minister Roland, whose death deprived the envoys of all their financial resources. Olivier returned to Paris, December, 1798, after an absence of six years, during which he visited Egypt, Greece, Turkey, Arabia, Persia. He brought home valuable collections in natural history, of which he published an account in his *Voyage dans l'Empire Ottoman, l'Egypte, et la Perse*, 3 vols. 4to., with plates. He died suddenly at Lyons, in 1814.

OLMEDO, a decayed town in the interior of Spain, and province of Valladolid, on the river Adagia. It was formerly large, and its walls are still of considerable extent; but it has now only 2000 inhabitants. Twenty miles south of Valladolid.

OLMETO, a town in the island of Corsica, with 1600 inhabitants. Nine miles south-west of Bastia.

OLMUTZ, a circle of the Austrian province of Moravia, comprising the north corner of the country adjoining to Glatz. Its area is 2020 square miles. The south part is level and fertile; the north hilly, enclosing a part of the Schneegebirge range of mountains. This circle is watered by the March, running from north to south, and contains several iron mines, an alum-work, large manufactures of woollen, linen, and linen-yarn; cotton-works, paper-mills, and glass-houses. The castle is strong, and has often

served as a state prison; eighty miles N. N. E. of Vienna. Population 347,300.

OLMUTZ, or HOLOMAUTZ, a town of Moravia, formerly the capital of the province, now only the chief town of the above circle, stands on the river March, and is strongly fortified, but the houses, though substantial, are high and gloomy, raised for the most part on square buttresses, with piazzas. The university was removed to Brunn in 1778, and its place is now supplied by a lyceum. Olmutz was long a bishop's see: this was raised to an archbishopric in 1777, and is one of the richest benefices of the empire. The principal public buildings are the hospital for lying-in women and orphans; the cathedral, in that part of the city called the Dom; a board for the management of the affairs of widows and minors; the riding academy; and an extensive public library. Olmutz has several tanneries and manufactories. One of its principal branches of trade is the sale of cattle from the south-west of Russia and Moldavia. This town was besieged in 1758 by Frederick II., but his efforts were baffled by the garrison, and the manoeuvres of marshal Daun. Population 11,000. 130 miles east by south of Prague, and 100 N. N. E. of Vienna.

OLNEY, or OULNEY, a market town and parish of Bucks, situate on the Ouse, five miles north from Newport Pagnell, and fifty-five from London. This town consists of one long street, and has long been noted for its manufacture of bone lace. The church has a beautiful spire, the only one in the county. Market day, Monday.

OLOCENTROS, in natural history, a name given by the Greeks to a small animal of the spider kind, whose bite was accounted mortal. It is the same with the solipuga, so called from its stinging or biting most violently in places or seasons where the sun had the most power, as Africa, &c. The name solifuga was a corrupt way of writing that word; and olocentros seems also a false way of writing heliocentros, which signifies the same as solipuga.

OLONETZ, an extensive government of European Russia, lying to the south of that Archangel, and to the east of Finland, between 29° 40' and 40° 20' of E. long., and 59° 40' and 65° 38' of N. lat. Its area (being equal to that of Great Britain) is 87,500 square miles: its population not more than 282,000, partly Russians, and partly Finns and Laplanders. The most remarkable rivers are the Onega, the Wug, the Kem, the Svir, the Schuja, the Vutegra, and the Vodlo. Of the lakes, by far the largest, those of Ladoga and Onega. This province has a range of low mountains in the north, extending southward from Scandinavia, called Mons Alaiunus. The rest is level; but the soil is universally poor, and but partially productive, the valleys being marshy, and the plains sandy. The climate is severe, particularly in the north, where little is produced besides moss and a few low shrubs and trees. These disadvantages prevent corn from being much cultivated, and necessitate a large annual import. There are forests on the southern mountains, and on the islands in the lake Onega, the timber of which, with the iron, marble, and vitriol of the mines, form the chief exports. Game and fish are abundant, and the

latter is exported in large quantities. The province is divided into seven circles; Petrozavodsk is the capital.

OLONETZ, a town of European Russia, in the government of the same name, eighty-four miles north-east of St. Petersburg, and 140 south of Petrozavodsk, on the river Olonza, near the lake Ladoga. It has a communication by water with St. Petersburg, and is remarkable as being the place where the first dock-yard was erected by Peter the Great. Ship-building is still carried on here. Inhabitants 2800. Long. 32° 58' E., lat. 60° 23' N.

OLOOT, a considerable manufacturing town of Catalonia, Spain, on the river Fluvia, twenty miles W. N. W. of Gerona. It has seven squares, great and small, three churches, two monasteries, and a large hospital. The manufactures are silk, woollen, and cotton stockings; raseens, serges, and coarse woollen stuffs; cottons, cotton yarn, leather, and soap. Inhabitants 15,000.

OLYMPIA, or **OLYMPIA PISATIS** according to Strabo, in ancient geography, a town of Elis, celebrated for a temple of Jupiter Olympius, before which stood a grove of wild olive trees, in which was the stadium or foot course, so called because the eighth part of a mile; and by which the Alpheus runs. Olympia was famous also for a temple of Juno, sixty-three feet long, with columns round it of the Doric order; and a Metroum or temple to the mother of the gods, a large Doric edifice, with holy treasures. These and the porticoes, a gymnasium, prytaneum, and many more public buildings, with the houses of the priests and other inhabitants, made Olympia a considerable place. The stadium was in the grove before the great temple; and near it was the hippodrome, or course for horse and chariot races. The temple of Jupiter was of the Doric order, sixty-eight feet high to the pediment, ninety-five wide, and 230 long; the cell encompassed with columns. It was erected with the country stone; the roof of Pentelic marble; the slabs disposed as tiles; the way to it up a winding staircase. The two pediments were enriched with sculpture; and one had over the centre a statue of Victory gilded, and underneath a votive buckler of gold. At each corner was a gilded vase. Above the columns were fixed twenty-one gilded bucklers, offered, at the conclusion of the Achaean war, by the Roman general Mummius. The gates of the two fronts were of brass, and over them were carved the labors of Hercules. Within the cell were double colonnades, between which was the approach to the image. The Jupiter of Olympia immortalised its maker Phidias. It was of ivory and gold, the head crowned with olive. In the right hand was a statue of Victory; in the left a flowered sceptre, composed of various metals, on which was an eagle. The sandals were of gold, as also the vestment, which was curiously embossed with lilies and animals. The throne was gold inlaid with ebony and ivory, and studded with jewels, intermixed with paintings and exquisite figures in relief. The pillars between the feet contributed to its support. Before it were walls, serving as a fence, decorated principally with the exploits of Hercules; the portion opposite to the door of a blue color. It was the office of a family descended

from Phidias, called phædruntæ, or the polishers, to keep the work bright and clean. The veil or curtain was cloth rich with the purple dye of Phœnicia, and with Assyrian embroidery, an offering of king Antiochus, and was let down from above by strings. The image appeared higher and broader than it measured. Its magnitude was such that, though the temple was very large, the artist seemed to have erred in the proportions. The god sitting nearly touched the ceiling with his head. A part of the pavement before it was of black marble, enclosed in a rim of Parian or white, where they poured oil to preserve the ivory. The altar of Jupiter Olympius was of great antiquity, and covered with ashes from the thighs of the victims, which were carried up and consumed on the top with wood of the white poplar tree. The ashes also of the prytaneum, in which a perpetual fire was kept on a hearth, were removed annually on a fixed day, and spread on it, being first mingled with water from the Alpheus. The cement was made with that fluid only; and therefore this river was esteemed the most friendly of any to the god. On each side of the altar were stone steps. Its height was twenty-two feet. Girls and women were allowed to ascend the basement, which was 125 feet in circumference. The people of Elis sacrificed daily, and private persons as often as they chose. Many deities were worshipped besides Jupiter. Pausanias has enumerated above sixty altars of various shapes and kinds. One of the unknown gods stood by the great altar. The people of Elis offered on all these monthly; laying on them boughs of olive, burning incense, and wheat mixed with honey; and pouring libations of such liquors as the ritual prescribed. At the latter ceremony sometimes a form of prayer was used, and they sung hymns composed in the Doric dialect. Olympia was situated on an eminence, between two mountains called Ossa and Olympus. Though its ancient splendor is gone, the place reminds the traveller of what it once was. It is in the Morea, and is now a small place, called Langanico, fifty miles south of Lepanto. Long. 22° 0' E., lat 37° 40' N.

OLYMPIA MALDACHINI (Donna), a woman of a very uncommon character. She flourished about the middle of the seventeenth century. She was sister-in-law to Pope Innocent X., and acquired an unlimited power over this vain and weak ecclesiastic. Her avarice and ambition were unbounded: she disposed of all benefices, which were kept vacant till she informed herself of their value: she rated an office of 1000 crowns for three years at one year's revenue, and if for life at twelve year's purchase, one half of which she required to be paid in advance: she gave audience upon public affairs, enacted new laws, and sat in council with Innocent, with bundles of memorials in her hands. It was said that they lived together in a criminal correspondence. On the election of pope Alexander VII. a number of memorials were sent in against her, and he banished her from Rome, and began to examine witnesses respecting her conduct. She was cut off, however, before the trial was finished, by the plague in 1636. Her immense property was not confiscated; the pope only reserving for his own relations about 1 000 000 of crowns.

OLYMPIAD, OLYMPIAS, the space of four years, whereby the Greeks reckoned time. The first Olympiad fell, according to the most accurate and learned computations, exactly 776 years before the first year of Christ, or 775 before that of his birth, in the year of the Julian period 3938, and twenty-two years before the building of Rome. The games were exhibited at the time of the full moon next after the summer solstice; therefore the Olympiads were of unequal length, because the time of the full moon differs eleven days every year, and for that reason they sometimes began the next day after the solstice, and at other times four weeks after. The computation by Olympiads ceased, as some suppose, after the 364th, in the year 440 of the Christian era. It was universally adopted, not only by the Greeks, but by many of the neighbouring countries; though still the Pythian games served as an epoch to the people of Delphi and to the Bœotians; the Nemean games to the Argives and Arcadians; and the Isthmian to the Corinthians and the inhabitants of the Peloponnesian isthmus. To the Olympiads history is much indebted. They have served to fix the time of many momentous events; and, indeed, before this method of computing time was observed, the history of Greece is mostly fabulous, and filled with obscurity, contradiction, and anachronism.

OLYMPIAS, a celebrated princess, daughter of Alexander I. king of Epirus, who married Philip II. king of Macedonia, by whom she had Alexander the Great. Her haughtiness, and probably her infidelity, obliged Philip to repudiate her, and to marry Cleopatra, the niece of king Attalus. Olympias and Alexander showed their disapprobation of this measure, by retiring from court. The murder of Philip soon followed (see **MACEON**) which some attribute to the intrigues of Olympias, who paid the greatest honor to her husband's murderer. She gathered his mangled limbs, placed a crown of gold on his head, and laid his ashes near those of Philip. The admiration of Alexander was in some instances offensive to Olympias; but, when the ambition of her son was concerned, she declared publicly that Alexander was not the son of Philip, but the offspring of Jupiter, who, in the form of an enormous serpent, had introduced himself into her bed. When Alexander was dead, Olympias seized the government of Macedonia; and, to establish her usurpation, she cruelly put to death Aridæus, with his wife Eurydice; Nicanor, the brother of Cassander, with 100 leading men of Macedon, who were inimical to her interest. These barbarities did not long remain unpunished: Cassander besieged her in Pydna, where she had retired with the remains of her family, and she surrendered after an obstinate siege. The conqueror ordered her to be put to death. A body of 200 soldiers were ordered to put the bloody commands into execution, but the splendor and majesty of the queen disarmed their courage. She was at last massacred by those whom she had cruelly deprived of their children, about A. A. C. 316. See **MACEON**.

OLYMPIC GAMES, solemn games among the ancient Greeks, so called from Jupiter Olympus, to whom they were dedicated and said to

have been first instituted by him, after his victory over the sons of Titan: others ascribe their institution to Hercules, the son of Alcmena; others to a Hercules of much greater antiquity; others to Pelops. But, by whomsoever they were instituted, at a period rather early they had fallen into disuse. The wars which prevailed among the Greeks had totally interrupted the religious ceremonies and exhibitions with which they had been accustomed to honor their common gods and heroes; but the Olympic games were restored by Iphitus, a descendant of Oxy-lus, to whom the province of Eleia had fallen in the general partition of the peninsula. The festival, which lasted five days, began and ended with a sacrifice to Olympian Jove. The intermediate time was chiefly filled up by the gymnastic exercises, in which all freemen of Grecian extraction were invited to contend, provided they had been born in lawful wedlock, and had lived untainted by any infamous immoral stain. The preparation for this part of the entertainment was made in the gymnasium of Elis, a spacious edifice, surrounded by a double range of pillars, with an open area in the middle. Adjoining were various apartments, containing baths and other conveniences for the combatants. The neighbouring country was adorned with porticoes, shady walks and groves, interspersed with seats and benches; the whole originally destined to relieve the fatigues and anxiety of the candidates for Olympic fame; and frequented in later times by sophists and philosophers, who were fond to contemplate wisdom, and communicate knowledge, in those delightful retreats. The order of the athletic exercises or combats was established by Lycurgus, and corresponded almost exactly to that described by Homer, in the twenty-third book of the Iliad, and eighth of the Odyssey. Iphitus appointed the other ceremonies and entertainments; settled the regular return of the festival at the end of every fourth year, in July; and gave to the whole solemnity that form and arrangement which it preserved with little variation above 1000 years; a period exceeding the duration of the most famous kingdoms and republics of antiquity. Among the benefactors of Olympia, at a much later period, was reckoned Herod, afterwards king of Judea. Seeing, on his way to Rome, the games neglected or dwindling into insignificance, from the poverty of the Eleans, he displayed a vast munificence as president, and provided an ample revenue for their future support and dignity. The care and management of the Olympics belonged for the most part to the Eleans; who on that account enjoyed their possessions without molestation, or fear of war or violence. They appointed a certain number of judges, who were to take care that those who offered themselves as competitors should perform their preparatory exercises; and these judges, during the solemnity, sat naked, having before them a crown of victory, formed of wild olive, which was presented to whomsoever they adjudged it. Those who were conquerors were called Olympionices, and were loaded with honors by their countrymen. At these games women were not allowed to be present; and if

any woman was found, during the solemnity, to have passed the river Alpheus, she was to be thrown headlong from a rock. This, however, was sometimes neglected; for we find not only women present at the celebration, but also some among the combatants, and some rewarded with the crown. The preparations for these festivals were great. No person was permitted to enter the lists, if he had not regularly exercised himself ten months before the celebration at the public gymnasium of Elis. No unfair dealings were allowed; whoever attempted to bribe his adversary was subjected to a severe fine; and even the father and relations were obliged to swear that they would have recourse to no artifice which might decide the victory in favor of their friends. No criminals, nor such as were connected with impious and guilty persons, were suffered to present themselves as combatants. The wrestlers were appointed by lot. Some little balls superscribed with a letter were thrown into a silver urn, and such as drew the same letter were obliged to contend one with the other. He who had an odd letter remained the last; and he often had the advantage, as he was to encounter the last who had obtained the superiority over his adversary. In these games were exhibited running, leaping, wrestling, boxing, and throwing the quoit, all which together were called *πενταθλον*, or *quinqertium*. There were also horse and chariot races, and contentions in poetry, eloquence, and the fine arts. The only reward that the conqueror obtained was a crown of olive. This, as some suppose, was in memory of the labors of Hercules, which were accomplished for the universal good of mankind, and for which the hero claimed no other reward but the consciousness of having been the friend of mankind. So small and trifling a reward stimulated courage and virtue, and was the source of greater honors than the most unbounded treasures. The statues of the Olympionicæ were erected at Olympia in the sacred wood of Jupiter. Their return home was that of a warlike conqueror; they were drawn in a chariot by four horses, and every where received with the greatest acclamations. Their entrance into their native city was not through the gates; to make it more grand and more solemn, a breach was made in the walls. Painters and poets were employed in celebrating their names; and indeed the victories severally obtained at Olympia are the subjects of the most beautiful odes of Pindar. The combatants were naked. A scarf was originally tied round their waist; but when it had entangled one of them, and been the cause that he lost the victory, it was laid aside. The Olympic games were observed every fifth year, or, to speak with greater exactness, after a revolution of four years, and in the first month of the fifth year; and they continued for five successive days. As they were the most ancient and most solemn of all the festivals of the Greeks, it will not appear wonderful that they drew so many people, not only inhabitants of Greece, but of the neighbouring islands and countries.

OLYMPIODORUS, a peripatetic philosopher of Egypt, born in Thebes, who flourished under Theodosius II., and wrote a history of the

eastern empire in Greek, in twenty-two books, from the seventh consulship of Honorius, and second of Theodosius, to the accession of Valentinian I. He wrote also, 2. A History of an Embassy to some of the Barbarous Nations of the North; 3. Commentaries on the Meteors of Aristotle, published by Aldus in 1550, folio; and 4. A Life of Plato.

OLYMPUS, a celebrated mountain of Macedonia and Thessaly, now called Lacha. The ancients supposed it to be the highest mountain in the world; that its top reached heaven; was the court of Jupiter, and the residence of the gods; and the poets feigned that upon it there were neither clouds, rain, nor wind, but an eternal spring.—Homer, *Iliad* 1. Virg. *Æn.* ii. vi. Ovid, *Met.* Lucan, Claudian, &c. It was also fabled to have been the scene of the battle between the gods and the giants. Its real height is about 6000 feet perpendicular; its top is always covered with snow.

OLYNTIANS, the inhabitants of Olynthus; a brave people, who, being betrayed by the Athenians, were conquered and sold for slaves by Philip II. See MACEDON.

OLYNTHUS, a celebrated city and republic of Macedon, on the isthmus of the peninsula of Pallene, once very flourishing, and able to dispute with Athens and Sparta. It was at last destroyed by Philip II. of Macedon.

OLYRA, in botany, a genus of the triandria order, and monocæia class of plants: natural order fourth, gramina: MALE CAL. biflorous and aristated glume: COR. a beardless glume: FEMALE CAL. a uniflorous, patulous, and ovate glume: style bifid: SEED cartilaginous.

OLZOFFSKI (Andrew), LL. D., an eminent Polish divine, born in 1618, and descended of an ancient family in Prussia. Having finished his studies, in law and divinity, he went to Rome, and took his degree of LL. D. He went thence to Paris, whence he attended the princess Mary Louisa, on her marriage with Ladislaus IV., king of Poland, to whom he was made Latin secretary. He attended the election of the emperor Leopold I. as ambassador from Poland, and on his return was made prebendary to the crown, bishop of Culm, and afterwards vice-chancellor, and grand chancellor. After the deaths of Ladislaus IV. and Michael, he had a great hand in procuring the election of king John Sobieski, who made him archbishop of Gnesna, and Primate of Poland. His right to the primacy being disputed by the bishop of Cracow, he published a work in defence of his right. He wrote several other tracts; and died at Dantzic, whither he had gone to settle some disputes between the senate and people, in 1678.

OMAGH, a barony in the county Tyrone, and province of Ulster, in Ireland. In this barony is a town of the same name, upon the river Ownreagh. The town, which is also the assize town of the county, is in the form of a Y, the stem being a long and regular avenue. Here is a new court-house, a gaol, large church, Roman Catholic chapel, and two Presbyterian meeting-houses. Omagh is a good market town, holds four fairs annually, is on the great road from Dublin to Londonderry, and has some very

interesting scenery, as well as ancient remains of military architecture in the vicinity. The name Omagh appears to be derived from Oigh-magh, which signifies the residence of the chief.

OMAR I., surnamed Ebn Al Khattab, successor of Abu Becr, was originally a violent opposer of the Arabian prophet. Mahomet felt this opposition, and regretted it; and it is said by prayer effected the conversion of this his dangerous antagonist. Omar had no sooner read the twentieth chapter of the Koran than he was convinced; upon which he instantly repaired to Mahomet and his followers, and declared his conversion. On the death of Abu Becr, who succeeded the impostor in the regal and pontifical dignities, Omar was raised to the throne. He conquered the Persians, and Jerusalem submitted to his power; nor does he appear to have been checked in a single instance. He was stabbed by a person of the Magian sect while performing his devotions; and, after languishing three days, died in the month of Dhu'l-hajja, and twenty-third year of the Hegira, which began A. D. 643, aged sixty-three. The Arab historians say that he reigned between ten and eleven years. His extensive conquests made the Moslem empire one of the most powerful and formidable monarchies in the world. His disposition is represented as one of the best possible, and his temperance is highly extolled.

OMAR II., the thirteenth caliph of the race of Ommiades, succeeded his cousin Solyman in 717. He laid siege to Constantinople, but was forced to raise it, and his fleet suffered much from a violent tempest. He was poisoned at Emessa, A. D. 720.

OMBI, a city of ancient Egypt, afterwards called Arsinoe and Crocodilopolis, was the capital of one of the nomes into which that country was divided, and is remarkable in the annals of idolatry for the hatred of its inhabitants to the religion of their neighbours the citizens of Tentyra. The cities and nomes of Egypt being at one time prone to rebellion, and to enter into conspiracies against monarchical government, one of their most politic kings contrived to introduce into the neighbouring nomes the worship of different animals; so that, while each revered the deity which itself held sacred, and despised that which its neighbours had consecrated, they could hardly be brought to join cordially in one common design to the disturbance of the government. In this distribution of gods, he conferred upon Ombi the crocodile, and upon Tentyra the mortal enemy of that monster, the ichneumon. The consequence was, that while the Ombites worshipped the crocodile, the Tentyrites took every opportunity of slaughtering him. Thus the mutual hatred of those cities, on account of their hostile gods, rose to such a height, that, whenever the inhabitants of the one were engaged in the more solemn rites of their religion, those of the other were sure to embrace the opportunity of setting fire to their houses, and doing them every injury in their power. And this animosity continued between the inhabitants of the two cities long after the crocodile and ichneumon had lost their divinity.

OM'BRE. *n. s.* Span. *hombre* (a man). A game of cards, played by three; supposed suitable to men.

He would willingly carry her to the play; but she had rather go to lady Centaure's, and play at ombre. *Tatler.*

When ombre calls, his hand and heart are free, And, joined to two, he fails not to make three. *Young.*

OMBRE is a game borrowed from the Spaniards, and played by two, by three, or by five persons, but generally by three. When three play, nine cards are dealt to each party; the whole pack being only forty, as the eights, nines, and tens, are thrown out. There are two sorts of counters for stakes, the greater and the less; the last having the same proportion to the other as a penny to a shilling: of the greater counters each man stakes one for the game; and one of the lesser for passing for the hand, when eldest, and for every card taken in. As to the order and value of the cards, the ace of spades, called spadillo, is always the highest trump, in whatsoever suit the trump be; the manille, or black duce, is the second; and the basto, or ace of clubs, is always the third: the next in order is the king, the queen, the knave, the seven, the six, the five, four, and three. Of the black there are eleven trumps; of the red twelve. The least small cards of the red are always the best, and the most of the black; except the duce and red seven, both of which are called the manilles, and are always second when the red is a trump. The red ace, when a trump, enters into the fourth place, and is called punto; otherwise it is only called an ace. The three principal cards are called matadores; which have this privilege, that they are not obliged to attend an inferior trump when it leads; but, for want of a small trump, the person may renounce trumps, and play any other card; and, when these are all in the same hand, the others pay three of the greater counters a-piece; and, with these three for a foundation, he may count as many matadores as he has cards in an uninterrupted series of trumps; for all which the others are to pay one counter a-piece. He who has the first hand is called ombre, and has his choice of playing the game, of naming the trump, and of taking in as many and as few cards as he pleases; and after him the second, &c. But, if he does not name the trump before he looks on the cards he has taken in, any other may prevent him, by naming what trump he pleases. He that has the first hand should neither take in, nor play, unless he has at least three sure tricks in his hand: for, as he wins the game who wins most tricks, he that can win five of the nine has a sure game; which is also the case if he wins four, and can so divide the tricks as that one person may win two, and the other three. If a person plays without discarding or changing any cards, this is called playing sans prendre; and, if another wins more tricks than he, he is said to win codille. The oversights in the course of the game are called beasts. And, if the ombre wins all the nine tricks, it is called winning the vole. In ombre by five, which many, on account of its not requiring so close an attention, prefer to that by

three, only eight cards a-piece are dealt; and five tricks must be won, otherwise the ombre is beasted. Here the person who undertakes the game, after naming the trump, calls a king to his assistance; upon which the person in whose hand the king is, without discovering himself, is to assist him as a partner, and to share his fate. If, between both, they can make five tricks, the ombre wins two counters, and the auxiliary king only one; but, when the counters are even, they divide them equally. If the ombre venture the game without calling in any king this too is called playing sans prendre; in which case the other four are all against him, and he must win five tricks alone, or be beasted. The rest is much the same as by three.

OMBRE DE SOLEIL, or shadow of the sun, in heraldry, is when the sun is borne in armory, so as that the eyes, nose, and mouth, which at other times are represented, do not appear; and the coloring is thin, so that the field can appear through it.

OMEGA, *n. s.* Gr. *ωμυα*. The last letter of the Greek alphabet; used in Scripture, therefore, for the last.

I am alpha and omega, the beginning and the ending. *Revelations.*

OM'ELET, *n. s.* Fr. *omelette*. A kind of pancake made with eggs.

|----------------------------|---|
| O'MEN, <i>n. s.</i> | } Latin <i>omen</i> , <i>ominor</i> . A prognostic; a sign or token of some supposed future event: omened and ominous mean containing or exhibiting omens, the latter being generally used in a bad sense, or of inauspicious omens: to ominate is to prognosticate; foretold; pretend to foretell: ominously and ominousness follow the senses of ominous. |
| O'MENED, <i>adj.</i> | |
| OM INATE, <i>v. a.</i> | |
| OM INOUS, <i>adj.</i> | |
| OM INOUSLY, <i>adv.</i> | |
| OM INOUSNESS, <i>n. s.</i> | |

Let me be duke of Clarence,
For Glo'ster's dukedom is ominous. *Shakespeare.*

Pomfret, thou bloody prison,
Fatal and ominous to noble peers. *Id.*
Though he had a good ominous name to have made a peace, nothing followed. *Bacon's Henry VII.*
Hammond would steal from his fellows into places of privacy, there to say his prayers, *omens* of his future pacifick temper and eminent devotion. *Fell.*

These accidents, the more rarely they happen, the more ominous are they esteemed, because they are never observed but when sad events do ensue. *Hayward.*

It brave to him, and ominous does appear,
To be opposed at first, and conquer here. *Cowley.*

Roving the Celtic and Iberian fields,
He fast betakes him to this ominous wood. *Milton.*

The falling of salt is an authentick presagement of ill luck, yet the same was not a general prognostick of future evil among the ancients; but a particular *omination* concerning the breach of friendship. *Browne.*

When young kings begin with scorn of justice,
They make an *omen* to their after reign. *Dryden.*

Pardon a father's tears,
And give them to Charinus' memory:
May they not prove as ominous to thee. *Id.*

As, in the heathen worship of God, a sacrifice without an heart was accounted *ominous*; so, in the Christian worship of him, an heart without a sacrifice is worthless. *South.*

This *ominates* sadly, as to our divisions with the Romanists. *Decay of Piety.*

Choose out other smiling hours
Such as have lucky *omens* shed
O'er forming laws and empires rising. *Prior.*

Fame may prove,
Or omened voice, the messenger of Jove,
Propitious to the search. *Pope's Odyssey.*

England a fortune-telling host
As numerous as the stars can boast;
Matrons who toss the cup, and see
Omens of fate in grounds of tea. *Churchill.*

OMEN, in its proper sense, signifies a sign or indication of some future event taken from the language of a person speaking without any intent to prophesy. Hence Tully says, 'the Pythagoreans attend to the discourse not only of gods, but also of men, which they call omens.' This sort of omen was supposed to depend much upon the will of the person concerned in the event; whence the phrases *acceptit omen*, *arripuit omen*. Such were the original omens; but they were afterwards derived from things as well as from words. Thus Paterculus, speaking of the head of Sulpicius on the rostrum, says, it was 'the omen of an impending proscription.' Suetonius says of Augustus, that he believed implicitly in certain omens; and that, 'if his shoes were improperly put on in the morning, especially if the left shoe was put upon his right foot, he held it for a bad omen.' Omen was used in a still larger sense, to signify an augury; as in the following line of Tully: 'Thus Jove confirmed the bright omen of the eagle.' It was lastly used, in the most generic sense of all, for a portent or prodigy; as in the third book of the *Æneid*, where a myrtle torn up by *Æneas* dropped blood. Upon this appearance, says the hero,—

Mute and amazed, my hair with terror stood;
Fear shrunk my sinews, and congealed my blood.

And the same thing being repeated upon his breaking a branch from another tree, he prayed to the gods to avert the omen. These portentous or supernatural omens were either external or internal. Of the former sort were those showers of blood so frequently occurring in the Roman history, which were much of the same nature with this adventure of *Æneas*, which he calls *monstra dæm*. Of the second sort were those sudden consternations which, seizing upon men without any visible cause, were imputed to the agency of the god Pan, and hence called panic fears. But indeed there was hardly anything, however trivial, from which the ancients did not draw omens. That it should have been thought a direful omen when any thing befel the temples, altars, or statues of the gods, need excite no wonder; but that the meeting of a eunuch, a negro, a bitch with whelps, or a snake lying in the road, should have been looked upon as portending bad fortune is a deplorable instance of human weakness, and of the pernicious influence of superstition on the mind. It is probable that this practice of making ordinary events ominous

of good or bad fortune took its rise in Egypt, the parent country of almost every superstition of paganism; but wherever it may have arisen, it spread itself over the whole inhabited globe, and still prevails in a greater or less degree among the vulgar of all nations. That paying any regard to omens is contrary to every principle of sound philosophy, all philosophers will readily acknowledge; and whoever has studied the writings of St. Paul must be convinced that it is inconsistent with the spirit of genuine Christianity.

OMENTUM, *n. s.* Lat. *omentum*. The reticulated caul that covers the guts.

When the peritonæum is cut, as usual, and the cavity of the abdomen laid open, the *omentum* or *caul* presents itself first to view. This membrane, which is like a wide and empty bag, covers the greatest part of the guts. Quincy.

OMENTUM. See ANATOMY, Index.

OMER, **HOMER**, **CORUS**, or **CHOMER**, in the Jewish antiquities, was a measure containing ten baths, or seventy-five gallons and five pints, as a measure of things liquid, and thirty-two pecks and one pint, as a measure for things dry. The *corus* or *omer* was most commonly a measure for things dry; and the greatest that was used among the Jews. It contained, according to the rabbins, ten ephahs or thirty sata or seahs. *Corus* is the most usual term in the historical writers, and *omer* or *chomer* among the prophets.

OMER (St.), a handsome and strong town of the department of the Pas de Calais, France, and the chief place of a subprefecture. Here is an inferior court of judicature, boards of trade and manufactures, an agricultural society, and a communal college. It is a post town of the third military division, with 18,250 inhabitants. This town is situated in a marshy country, on the Aa, which is navigable here, and at the mouth of the canal of Neuf fossé. It is generally well built, and surrounded with good fortifications. The streets are broad, spacious, and airy, and the great square is adorned with several beautiful buildings. The foundation of St. Omer is traced to as early a period as 626, the epoch of the founding of the celebrated abbey of Bertin. It was encompassed with walls in 880, and has increased considerably since that period. The French took possession of it in 1677. Here are manufactures of cloth, twisted thread, starch, soap, oil, glue, pipes, and fishing nets; also dye-houses, sugar refining houses, brass foundries, paper mills, and tan-yards. A considerable trade is carried on in corn, wine, oil, brandy, grocery, flax and coal. The public library contains 20,000 volumes. The cathedral is a fine Gothic edifice; the college church, with its two towers and its wooden arch, is very remarkable. There are also some fine walks near the town. It is fifty-one miles north-west of Arras, thirty-six east of Dunkirk, and 178 north of Paris.

OMISSION, *n. s.* } Lat. *omissus*. A forgetting; or neglect of
OMIT, *v. a.* }
OMITTANCE, *n. s.* } performance: to omit is, to leave out; neglect to practise or to mention: omission, an obsolete synonyme of omission.

He said, mine eyes were black, and my hair black: And, now I am remembered, scorned at me;

I marvel, why I answered not again;
But that's all one: *omittances* is no quittance.

Shakespeare.

Omission to do what is necessary,
Seals a commission to a blank of danger. *Id.*
These personal comparisons I omit, because I would say nothing that may savour of a spirit of flattery. Bacon.

Great Cato there, for gravity renowned,
Who can omit the Gracchi, who declare
The Scipios' worth? Dryden.

Whilst they were held back purely by doubts and scruples, and want of knowledge without their own faults, their omission was fit to be connived at.

Kestlenell.

The most natural division of all offences is into those of omission and those of commission.

Addison.

Her father omitted nothing in her education, that might make her the most accomplished woman of her age. *Id.*

If he has made no provision for this change, the omission can never be repaired, the time never redeemed. Rogers.

Omitting, therefore, any mention of sultry Sirius—sylvan shade—purling rills—gurgling fountains, &c., he tells us simply that it was 'all on a summer's day.' Canning.

OMMANEY, **CAPE**, a very remarkable promontory, the south extremity of king George the Third's archipelago. It terminates in a high bluff rocky cliff, with a round rocky islet close to it; and by its shores on the eastern side taking a sharp northerly direction, it becomes a very narrow point of land, which received the name which it now bears from captain Colnety. Long. 225° 37' 30" E., lat. 56° 10' N.

OMMEN, a town of the Netherlands, in the province of Overysse, on the Vechte, with 800 inhabitants. A few miles to the north lies the fortress of Ommerschautz, fourteen miles east of Zwolle.

OMMON, a division of Arabia, comprising the coast extending from its eastern extremity of Rasalgate, to the entrance of the Persian Gulf. The interior consists in a great measure of sandy wastes. The coast, however, is diversified by mountains, and well watered; so that it yields barley, palms, lentiles, grapes, &c. The inhabitants have always been amongst the most active and commercial Arabs. They are the best navigators of Arabia: and use vessels called *tranckies*, very broad in proportion to their length, and which have sails made of cloth, instead of those of mat which are used in Yemen; but the most singular circumstance in their construction is, that the planks, instead of being fastened together by nails, are merely tied and sewed. Ommon has repeatedly become an object of ambition. The Portuguese early invaded and took possession of Maskat, its principal port, which they retained for nearly 200 years. In the course of the last century Nadir Shah invaded and conquered it; but, his arms being diverted in other quarters, the native princes regained the dominion. Rostak is the residence of the Imam; but Maskat is the place through which the country is known to Europeans. Kalhat and Sohar are also large towns.

OMNIFARIOUS, *adj.* Lat. *omnifarium*. Of all kinds.

These particles could never of themselves, by *omnifarious* kinds of motion, whether fortuitous or mechanical, have fallen into this visible system.

Bentley.

But if thou *omnifarious* drinks wouldst brew;
Besides the orchard, every hedge and bush
Affords assistance.

Philips.

OMNIFIC, *adj.* Lat. *omnis* and *facio*. All-creating.

Silence, ye troubled waves, and thou deep peace!
Said then the '*omnifick*' word, your discord end.

Milton.

OMNIPAR'ITY, *n. s.* Lat. *omnis* and *par*. General equality.

Their own working heads affect, without commandment of the word, to wit, *omniparity* of churchmen.

White.

OMNIPOTENCE, *n. s.* } Lat. *omnipotent*
OMNIPOTENCY. } *tia*. Almightiness;

OMNIPOTENT, *adj.* } boundless or universal power.

You were also, Jupiter, a swan, for the love of Leda: oh, *omnipotent* love! how near the god drew to the complexion of a goose!

Shakespeare.

The perfect being must needs be *omnipotent*; both as self-existent and as immense; for he that is self-existent, having the power of being, hath the power of all being; equal to the cause of all being, which is to be *omnipotent*.

Grew.

Whatever fortune

Can give or take, love wants not, or despises;
Or by his own *omnipotence* supplies.

Denham.

As the soul bears the image of the divine wisdom, so this part of the body represents the *omnipotency* of God, whilst it is able to perform such wonderful effects.

Wilkins.

The greatest danger is from the greatest power, and that is *omnipotency*.

Tillotson.

How are thy servants blest, O Lord,

How sure is their defence;

Eternal wisdom is their guide,

Their help, *omnipotence*.

Addison.

Will *omnipotence* neglect to save,

The suffering virtue of the wise and brave?

Pope.

OMNIPRES'ENCE, *n. s.* } Lat. *omnis* and
OMNIPRES'ENT, *adj.* } *præsens*. Ubiquity; universal presence.

He also went

Invisible, yet staid, such privilege

Hath *omnipresence*. *Milton's Paradise Lost.*

Adam, thou knowest his *omnipresence* fills

Land, sea, and air.

Id.

The soul is involved and present to every part; and, if my soul can have its effectual energy upon my body with ease, with how much more facility can a being of immense existence and *omnipresence*, of infinite wisdom and power, govern a great but finite universe!

Hale.

God is *omnipresent* ever felt

In the void waste as in the city full.

Thomson.

OMNISCIENCE, *n. s.* } Lat. *omnis* and
OMNISCI'ENT, *adj.* } *scientia*. Boundless
OMNISCI'OUS. } or universal know-

ledge; infinite wisdom: *omniscient* and *omniscious* are both used as the adjective.

By no means trust to your own judgment alone: for no man is *omniscient*. *Bacon's Advice to Vilhers.*

In all this misconstruction of my actions, as I have no judge but God above me, so I can have comfort to appeal to his *omniscience*. *King Charles.*

I dare not pronounce him *omniscious*, that being an attribute individually proper to the Godhead, and incommunicable to any created substance.

Habswill on Providence.

What can escape the eyes

Of God all-seeing, or deceive his heart

Omniscient?

Milton's Paradise Lost.

For know, that heaven's *omniscient* King

Keeps register of every thing;

And nothing may we use in vain,

Even beasts must be with justice slain. *Marvell.*

Thinking by retirement to obscure himself from God, Adam infringing the *omniscience* and essential ubiquity of his Maker, who, as he created all things, is beyond and in them all.

Browne.

Since thou boast'st the '*omniscience*' of a God,
Say in what cranny of Sebastian's soul,
Unknown to me, so loathed a crime is lodged?

Dryden.

Whatsoever is known is some way present; and that which is present cannot but be known by him who is *omniscient*.

South.

It is one of the natural notions belonging to the Supreme Being, to conceive of him that he is *omniscient*.

Wilkins.

The views of that *Omniscient* Spirit who gave the prophecy—not the surmises' of the men whose faculties or whose organs that Spirit employed, are to be the standard of interpretation.

Horsley.

OMNIVOROUS, *adj.* Lat. *omnis* and *voro*. All-devouring.

OMOLONE, a river of Irkoutsk, Asiatic Russia, which falls into the Kolyma, after a course of about 250 miles. Its banks are chiefly inhabited by exiles, who employ themselves in fishing and hunting.

OMOPHAGIA, an ancient Greek festival, in honor of Bacchus Omophagos. This festival was observed in the same manner with the other festivals of Bacchus, in which they counterfeited madness. What was peculiar to it was, that the worshippers used to eat the entrails of goats, raw and bloody, in imitation of the god, who was supposed to have done the same thing.

OMPHACINE OIL, an ancient name for a viscous brown juice extracted from green olives. With this oil the ancient athlete, when going to wrestle, anointed themselves; and, when that gymnastic exercise was over, they rolled themselves in the sand, which, mixing with the oil and sweat on their bodies, constituted the strimenta so highly esteemed in the cure of several diseases. This precious medicine was carefully scraped off the body of the athlete with a kind of instrument something like a comb, which was called strigilis; and such was the demand for the scrapings that they were a very lucrative article of trade.

OMPHALE, in fabulous history, a queen of Lydia, daughter of Jardaunus. She married Imolus, who at his death left her mistress of his kingdom. Omphale had been informed of the great exploits of Hercules, and wished to see so illustrious a hero. Her wish was soon gratified. After the murder of Eurytus, Hercules by way of atonement was ordered to be sold as a slave, that he might recover the use of his senses. Mercury was commissioned to sell him, and Omphale bought him, and restored him to liberty. The hero became enamored of his mistress, and the queen favored his passion, and had two sons by

him, Agelaus and Lamon; from whom were descended Gyges and Cræsus; though some make these Lydian monarchs spring from Alcæus, a son of Hercules, by one of the female servants of Omphale. Hercules is represented by the poets as so desperately enamoured of the queen, that, to conciliate her, he spun by her side among her women, while she covered herself with the lion's skin, and armed herself with the club of the hero, often striking him with her sandals for the uncouth manner with which he held the distaff, &c.

OMPHALEA, in botany, a genus of the triandria order, and the monœcia class of plants: MALE CAL. tetraphyllous: COR. none: the receptacle into which the antheræ are sunk is ovate: FEMALE CAL. and COR. as in the male; the stigma trifid: CAPS. carnosous and trilocular: SEED one. There are two species.

OMPHALO-MESENTERIC, in anatomy. All fetuses are wrapped up in at least two coats or membranes; most of them have a third called allantoides or urinary. Some, as the dog, cat, hare, &c., have a fourth, which has two blood-vessels, viz. a vein and an artery, called omphalo-mesenterics, because passing along the string to the navel, and terminating in the mesentery.

OMRATTEE, a large fortified trading town of Hindostan, in the province of Berar. It belongs to the Nizam; and from this place a considerable quantity of cotton is sent the distance of 500 miles by land, to Mirzapore, a famous mart on the banks of the Ganges, in the province of Allahabad.

OMSK, a fortress and small town of the government of Tomsk, in Asiatic Russia, at the junction of the river Om with the Irtysch. The original fort was built in 1716, upon a spot higher up the Irtysch; but in 1766 general Springer fixed upon the present site, where a regular and strong fortress has been erected. Omsk is intended as a barrier against the Kirghises: it terminates the military line of the Irtysch, and begins that of the Ischim. The general's house, church, and military school, are handsome edifices. Long. 74° 54' E., lat. 55° 4' N.

ON, *prep., adv., & interj.* } Sax. *on*; Goth. *ONSET*, *n. s. & v. a.* } *on*; Danish and *ON'SLAUGHT*, } Teut. *an*; Belg. *aan*, *aen*, *an*. As a preposition, it is placed before that which is under, which supports any thing, and which keeps it from falling; which is struck by a body falling; or to which the thing preceding it is added: also accumulation; elevation; progression; approach; invasion; reliance; occasion or motive; invocation; imprecation; stipulation or condition; distinction or opposition; manner; it is placed before the subject of action or passion. As an adverb, it signifies in order of succession; forward; upon (as an article of dress); resolution, and is the regular opponent of *off*. As an interjection, it is taken elliptically for 'go on,' and commands or encourages forward or to attack. On fire, denotes the state of combustion: onset (*on* and *set*), means a set-on or attack; storm; assault; something set on: to attack or assault: on-slaught is an obsolete compound (of *on* and *slay*) of the same sense: onward is forward; progressively; further on.

In the second month, *on* the twenty-seventh day.

Genesis.

A long cloak he had *on*.

Sidney.

The horses burnt as they stood fast tied in the stables, or, by chance breaking loose, ran up and down with their tails and manes *on* a light fire.

Knolles's History of the Turks.

The Rhodians, *on* the other side, mindful of their former honour, valiantly repulsed the enemy.

Knolles.

What news?

—Richmond is *on* the seas.

—There let him sink, and be the seas *on* him.

Shakespeare.

This tempest,
Dashing the garment of this peace, abbed
The sudden breach *on't*.

Id. Henry VIII.

On each side her

Stood pretty dimpled boys, like smiling

Cupids. *Id. Antony and Cleopatra.*

Let them sleep, let them sleep *on*,

Till this stormy night be gone,

And the eternal morrow dawn. *Crashaw.*

Distracted terror knew not what was best;
On what determination to abide. *Daniel's Civil War.*

Since 'tis decreed, and to this period lead

A thousand ways, the noblest path we'll tread;

And bravely *on*, till they or we, or all,

A common sacrifice to honour fall. *Denham.*

Satan was now at hand, and from his seat

The monster, moving *onward*, came as fast

With horrid strides. *Milton's Paradise Lost.*

Him thro' the spicy forest *onward* come

Adam discerned, as in the door he sat

Of his cool bower. *Id.*

How soon hath Time, the subtle thief of youth,

Sto'n *on* his wing my three and twentieth year.

Milton.

So saying, *on* he led his radiant files. *Id.*

You roam about, and never are at rest;

By new desires, that is, new torments still possess:

As in a feverish dream you still drink *on*,

And wonder why your thirst is never gone. *Dryden.*

The joy of a monarch, for the news of a victory, must not be expressed like the extacy of a harlequin

on the receipt of a letter from his mistress. *Id.*

Hence *on* thy life; the captive maid is mine,

Whom not for price or prayers I will resign. *Id.*

Could tears recal him into wretched life,

Their sorrow hurts themselves; *on* him is lost. *Id.*

Th' unhappy husband, husband now no more,

Did *on* his tuneful harp his loss deplore. *Id.*

Mischiefs *on* mischiefs, greater still and more,

The neighbouring plains with arms are covered o'er. *Id.*

The best way to be used by a father *on* any occasion, to reform any thing he wishes mended in his son. *Locke.*

If the tenant fail the landlord, he must fail his creditor, and he his, and so *on*. *Id.*

A thriving gamester has but a poor trade *on't*, who fills his pockets at the price of his reputation. *Id. on Education.*

As he forbore one act, so he might have forbore another, and after that another, and so *on*, till he had by degrees weakened, and at length mortified and extinguished the habit itself. *South.*

'Go to, I did not mean to chide you;

On with your tale. *Rowe's Jane Shore.*

The spacious firmament *on* high. *Addison.*

On God's providence and *on* your bounty, all their present support and future hopes depend. *Smallridge.*

We abstain on such solemn occasions from things lawful, out of indignation that we have often gratified ourselves in things unlawful. *Id.*

Stiff in brocade, and pinched in stays,
Her patches, paint, and jewels on;
All day let envy view her face,
And Phillis is but twenty-one. *Prior.*

These smaller particles are again composed of others much smaller, all which together are equal to all the pores or empty spaces between them; and so on perpetually till you come to solid particles, such as have no pores. *Newton.*

What kindled in the dark the vital flame,
And, ere the heart was formed, pushed on the red-
ning stream? *Blackmore on Creation.*

A painted vest prince Voltager had on,
Which from a naked Pict his grandsire won. *Blackmore.*

On me, on me let all thy fury fall,
Nor err from me, since I deserve it all. *Pope.*
His fancy grows in the progress, and becomes on
fire, like a chariot wheel, by its own rapidity. *Id.*
On then, my muse! and fools and knaves expose,
And, since thou can'st not make a friend, make foes. *Young.*

But aye the ruthless driver goads them on,
And aye of barking dogs the bitter throng,
Makes them renew their unmelodious moan. *Thomson.*

Place me on Sirmium's marble steep,
Where nothing save the waves and I
May hear our mutual murmurs sweep,
There, swan-like, let me sing and die. *Byron.*
Thou too—the nameless bard!—whose honest zeal
For law, for morals, for the public weal,
Pours down impetuous on the country's foes
The stream of verse, and many-linguaged prose. *Canning.*

On, in ancient geography, a city of Egypt, sacred to the sun, and by the Greeks, on that account, called Heliopolis. It was remarkable for the wisdom and learning of its priesthood, and for the spacious buildings in which they cultivated the studies of philosophy and astronomy. The priests of On were esteemed more noble than all the other priests of Egypt, and were always ministers of state, owing to their high antiquity and great learning. Bishop Warburton affirms that they held the system which now distinguishes the name of Copernicus; and that Pythagoras received it from Oenuphis, a priest of On, and brought it into Greece.

ONE, *adj. & n. s.* } Sax. *cen*; Goth. *ein*;
ONCE, *adj. & n. s.* } Teut. *ein*; Gr. *ev*. Single;
ONE'EYED, } sole; different or diverse
ONE'NESS, *n. s.* } (opposed to another); the

same; future, as in 'one day:' as a noun substantive, an unit; single person or mess; the same thing; first hour; a person indefinitely; a distinct or particular person; an eminent person; persons united; concord; agreement: it takes, but not elegantly, a plural both absolutely and relatively, as 'the great ones of the world;' 'his waking thoughts only reflect his sleeping ones.' Once signifies a single time; an instant or indivisible point of time; time past and not to be repeated or again occur; at the immediate time; formerly: as a noun substantive it seems to mean occasion; occurrence; instance; as 'this or that once:' one-eyed is having but one eye: oneness, quality of being one; unity; compactness.

For he hid this thyng in offryng himselfe *oonys*.
Wiclif.

Ask from the one side of heaven unto the other, whether there hath been any such thing as this?

Deuteronomy iv. 32.

When any one heareth the word of the kingdom, and understandeth it not, then cometh the wicked one and catcheth away that which was sown in his heart. *Mat. xiii. 19.*

It is not so worthy to be brought to heroic effects by fortune or necessity, like Ulysses and Æneas, as by one's own choice and working. *Sidney.*

One day when Phoebe fair,
With all her band, was following the chase,
This nymph, quite tired with heat of scorching air,
Sat down to rest. *Spenser.*

Although the beauties, riches, honours, sciences, virtues, and perfections of all men, were in the present possession of one, yet somewhat beyond and above all this there would still be sought and earnestly thirsted for. *Hooker.*

Our God is one, or rather very oneness and mere unity, having nothing but itself in itself, and not consisting, as all things do besides God, of many things. *Id.*

If one by one you wedded all the world,
She you killed would be unparalleled. *Shakespeare.*

Till 'tis one o'clock, our dance of custom
Let us not forget. *Id.*

Then must you speak
Of one, that loved not wisely, but too well;
Of one, not easily jealous; but, being wrought,
Perplexed in the extreme. *Id. Othello.*
Be not found here; hence with your little ones. *Shakespeare.*

I answered not again;

But that's all one. *Id.*

As I have made ye one, lords, one remain:
So I grow stronger, you more honour gain. *Id.*
Pindarus the poet, and one of the wisest, acknowledged also one God, the most high, to be the father and creator of all things. *Raleigh.*

That man should be the teacher is no part of the matter; for birds will learn one of another.

Bacon's Natural History.

The king was well instructed how to carry himself between Ferdinando and Philip, resolving to keep them at one within themselves. *Bacon.*

Trees that bear mast are fruitful but once in two years; the cause is, the expence of sap. *Id.*

Heaven waxeth old, and all the spheres above
Shall one day faint, and their swift motion stay;
And time itself, in time, shall cease to move,
But the soul survives and lives for aye. *Devis.*

If any one prince made a felicity in this life, and left fair fame after death, without the love of his subjects, there were some colour to despise it. *Suchling.*

The obedience of the one to the call of grace, when the other, supposed to have sufficient, if not an equal measure, obeys not, may reasonably be imputed to the humble, malleable, melting temper. *Hammond.*

The oneness of our Lord Jesus Christ, referring to the several hypostases, is the one eternal, indivisible, divine nature, and the eternity of the son's generation, and his co-eternity, and his consubstantiality with the Father when he came down from Heaven and was incarnate. *Id.*

Once every morn he marched, and once at night. *Cowley.*

Thereon his arms and once-loved portrait lay,
Thither our fatal marriage-bed convey. *Denham.*

At once with him they rose:

Their rising all at once was as the sound
Of thunder heard remote. *Milton's Paradise Lost.*

Edward I. was *one* who very well knew how to use a victory, as well as obtain it. *Hale.*

These successes are more glorious which bring benefit to the world, than such ruinous *ones* as are dyed in human blood. *Glanville.*

The church is therefore *one*, though the members may be many ; because they all agree in *one* faith. There is *one* Lord and *one* faith, and that truth once delivered to the saints, which whosoever shall receive, embrace, and profess, must necessarily be accounted *one* in reference to that profession : for if a company of believers become a church by believing, they must also become *one* church by believing *one* truth. *Pearson.*

With lives and fortunes trusting *one*,
Who so discreetly used his own. *Waller.*

Both the matter of the stone and marcasite had been at once fluid bodies, till *one* of them, probably the marcasite, first growing hard, the other, as being yet of a more yielding consistence, accommodated itself to the harder's figure. *Boyle.*

He that will overlook the true reason of a thing which is but *one*, may easily find many false *ones*, error being infinite. *Tillotson.*

He is not at *one* with himself what account to give of it. *Id.*

From his lofty steed he flew,
And raising *one* by *one* the suppliant crew,
To comfort each. *Dryden's Knight's Tale.*

If *one* must be rejected, *one* succeed,
Make him my lord, within whose faithful breast,
Is fixed my image, and who loves me best. *Id.*

Night came on not by degrees prepared,
But all at *once* ; at *once* the winds arise,
The thunders roll. *Id. Cimon and Iphigenia.*

Fuscinus, those ill deeds that sully fame,
In blood *ones* tainted, like a current run
From the lewd father to the lewder son. *Dryden.*

It is *one* thing to draw outlines true, the features like, the proportions exact, the colouring tolerable, and another thing to make all these graceful. *Id.*

A sign-post dauber would disdain to paint
The *emerged* heroe on his elephant. *Id.*

It is *one* thing to think right, and another thing to know the right way to lay our thoughts before others with advantage and clearness. *Locke.*

Suppose the common depth of the sea, taking *one* place with another, to be about a quarter of a mile. *Burnet.*

There can be no reason why we should prefer any *one* action to another, but because we have greater hopes of advantage from the *one* than from the other. *Smallridge.*

Arbitrary power tends to make a man a bad sovereign, who might possibly have been a good *one*, had he been invested with an authority limited by law. *Addison's Freeholder.*

My legs were closed together by so many wrappers *one* over another, that I looked like an Egyptian mummy. *Addison.*

The mighty family
Of *one-eyed* brothers hasten to the shore. *Id.*

Now that the fixed stars by reason of their immense distance, appear like points, unless so far as their light is dilated by refraction, may appear from hence, that when the moon passes over and eclipses them, their light vanishes, not gradually like that of the planets, but all at *once*. *Newton.*

One would imagine these to be the expressions of a man blessed with ease, affluence, and power ; not of *one* who had been just stripped of all those advantages. *Atterbury.*

The following plain rules and directions are not *de* less useful because they are plain *ones*. *Id.*

This hath all its force at *once*, upon the first impression, and is ever afterwards in a declining state. *Id.*

For provoking of urine, *one* should begin with the gentlest first. *Arbuthnot on Aliments.*

Two bones rubbed hard against *one* another, or with a file, produce a fetid smell. *Arbuthnot.*

When joined in *one*, the good, the fair, the great,
Descends to view the muses humble seat. *Glanville.*

At *one* time they keep their patients so warm as almost to stifle them, and all of a sudden the cold regimen is in vogue. *Baker.*

For some time *one* was not thought to understand Aristotle, unless he had read him with Averroes's comment. *Id.*

In your tuneful lays,
Once more resound the great Apollo's praise. *Pope.*

This evil fortune which attends extraordinary men, hath been imputed to divers causes that need not be set down, when so obvious an *one* occurs, that when a great genius appears, the dunces are all in conspiracy against him. *Swift.*

A good acquaintance with method will greatly assist every *one* in ranging human affairs. *Watts.*

Smooth to the shelving brink a copious flood
Rolls fair and placid ; where collected all
one impetuous torrent down the steep
It thundering shoots. *Thomson.*

New forms in dire vicissitude invade,
The rustling brake alarms and quivering shade ;
Nor light, nor darkness, brings his pain-relief,
One shows the plunder, a *one* hides the thief. *Johnson.*

God, working ever on a social plan,
By various ties attaches man to man :
He made at first, though free and unconfined,
One man the common father of the kind. *Cowper.*
The wretch that works, and weeps without relief,
Has *One* that notices his silent grief.
He, from whose hands alone all power proceeds,
Ranks its abuse amongst the foulest deeds ;
Considers all injustice with a frown,
But marks the man that treads his fellow down.

And she may now be as discreet and wise,
As *once* absurd in all discerning eyes.
Sobriety perhaps may now be found
Where *once* intoxication pressed the ground. *Id.*
When *one* is vexed by *one* person, to revenge *one's* self on another that happens to come in the way, is the vilest injustice. *Sheridan.*

But pause *one* moment more and take
The curse of him thou didst forsake,
And look *once* more to heaven, and see
Its love for ever shut from thee. *Byron.*

Who, when terror and doubt through the universe reigned,
While rapine and treason their standards unfurled,
The heart and the hopes of his country maintained,
And *one* kingdom preserved midat the wreck of the world. *Canning.*

ONEHOW, one of the Sandwich Islands, in the North Pacific, about forty miles in circumference. It is fruitful in yams, and contains about 10,000 inhabitants. The coast is high, and rises on the east abruptly from the sea ; the rest of the island consists of, low ground, except a round bluff head on the south-east point.

ONEGA, a large lake of European Russia, in the government of Olonetz, to the east of Ladoga. Its length is about 130 miles, its breadth,

from seventy to eighty. It contains several islands, of which the basis is marble: its waters are beautifully clear, and abound in fish. The Svir, a navigable stream, joins these lakes; and as the smaller lake of Bielo, situated to the south, and in the direction of the Wolga, is at the distance of only twenty-five miles, it has been proposed to join these by a canal.

ONEGA, a river of the north of European Russia, which rises to the east of Onega, and, flowing northward, falls into the White Sea, in a gulf of this name.

ONEGLIA, a province of Piedmont, which, until 1566, formed a distinct principality belonging to the house of Doria; but is now transferred to Sardinia. Its principal productions are olive-oil and fruit. It contains, on a surface of 100 square miles, one town, fifty-one villages, and nearly 29,000 inhabitants.

ONEGLIA, a town in the north of Italy, the capital of the Piedmontese province of this name, situated on the sea coast, at the mouth of the river Impero. It has a small harbour, a population of 5000, and a traffic in wine, fruit, and olive-oil. It is partly fortified, and contains some fine churches and a gymnasium. Here the celebrated Andrew Doria was born. It is thirty-six miles E. N. E. of Nice.

ONEIDA, a county of New York, bounded north by Lewis county, east by Herkimer county, and south-west by Madison county, and west by Oswego county. Population 33,792. Chief towns, Whitesborough, Utica, and Rome.

ONEIDA, a lake, chiefly in Oneida county, is twenty miles long and four broad. It receives Wood Creek on the east end, and communicates with Lake Ontario by the Oswego. It is a very beautiful lake, abounding in fish.

ONEIDA CREEK, a river of New York, which runs north into the east end of Oneida Lake. Length twenty-five miles.

ONEIROCRITIC, *n. s.* } Gr. *ονειροκριτικός*.

ONEIROCRITICAL, *adj.* } An interpreter of dreams; interpretative of dreams.

If a man has no mind to pass by abruptly from his imagined to his real circumstances, he may employ himself in that new kind of observation which my *oneirocritical* correspondent has directed him to make. *Addison's Spectator.*

Having surveyed all ranks and professions, I do not find in any quarter of the town an *oneirocritical*, or an interpreter of dreams. *Id.*

ONERARY, *adj.* } Lat. *onero*. Fitted for
ONERATE, *v. a.* } burdens: to load or bur-
ONEROUS, *adj.* } den: burdensome.

A banished person, absent out of necessity, retains all things *onerous* to himself, as a punishment for his crime. *Ayliffe.*

ONESIÆ THERMÆ, were, according to Strabo, excellent baths, and salutary waters, at the foot of the Pyrenees in Aquitania. Near the river Adour, the ancient Atur, stands Bagneres, famous for its waters, which appear to be the Onesie of Strabo. See BAGNERES.

ONESICRITUS, a cynic philosopher and historian of Ægina, who accompanied Alexander the Great into Asia, and was sent by him to the Indian Gymnosophists. He wrote a history of Alexander's expedition, which has been censured

for the romantic and exaggerated anecdotes it contains. *Plut. in Alex. Q. Curt. ix. 10.*

ONESIMUS, a Macedonian nobleman and historian, who flourished at Rome in the third century, and was patronised by the reigning emperors. He wrote the lives of the emperors Probus and Carus with great elegance and accuracy.

ONGLEE, in heraldry, an appellation given to beasts or birds when the talons or claws are borne of a different color from that of the body of the animal.

ONGOLE, a district and town, in the Northern Carnatic, situated between 15° and 16° of N. lat. The district was formerly dependent on the Kirpa or Cudapah principality; but was afterwards incorporated with the Carnatic below the Ghauts, and subject to Arcot. The sovereignty was finally acquired by the East India Company in 1801, by treaty with the nabob; and with Nelloor, and now forms one of the collectorships, into which the Carnatic has been subdivided. It is of inferior fertility to Tanjore, and has never been remarkable for trade or manufactures. The Mussy and the Gode-gamma are the principal rivers. The chief towns are Ongole, Couchier, and Sintelsheroo. The town, formerly fortified, is 173 miles north by west from Madras.

ONLE OPPIDUM, and ONLE TEMPLUM, a town and temple, so called from Onias, the high-priest of the Jews in Egypt; who built a temple in imitation of that at Jerusalem, by permission of the king of Egypt, on the spot where stood the temple of Diana Aretis in Leontopolis; it was encompassed with a brick wall, and had a large tower like that at Jerusalem. (Josephus). It was the metropolis of the Nomos Hesiopositis (Ptolemy), because in Strabo's time Heliopolis was fallen to decay.

ONION, *n. s.* Fr. *oignon*; (Lat. *unio*?) A well known bulbous plant.

If the boy have not a woman's gift
To rain a shower of commanded tears,
An onion will do well. *Shakespeare.*
I, an ass, am onion-eyed. *Id.*
This is every cook's opinion,
No savory dish without an onion;
But, lest your kissing should be spoiled,
Your onions must be thoroughly boiled.

Swift.
Of the second division, or the onion kind, the characters, &c., the species are these, 1st. Ceps, or common onion, the best garden varieties of which are the Strasburgh or common round onion, the oval long keeping common onion, the Spanish large flat onion, &c. *Dr. A. Rees.*

ONION. See ALLIUM. Onions, leeks, and garlic, are all of the same genus; and in their recent state are acrid, but harmless to the human body. When, by age or climate, this acrimony is too great, they are not used as food. In Spain the garlic, being equally mild with the onion, is used as common food. By the ordinary culinary preparation their acrimony is dissipated, and a remarkably mild substance remains, affording much nutriment. They are used in medicine, uniting the two qualities of pectorals, viz. by their acrimony, being in their recent state expectorant; in their boiled state, on account of their

mucilage, demulcent, provided the quantity taken be sufficient. Some have found in leeks a somniferous quality; and onions are undoubtedly possessed of this property, as any person may be satisfied, by eating one or two, when wakeful in the night. Besides the three species above mentioned, there are several others belonging to the same tribe, which we use as condiment; but only the leek and onion as diet. In its recent state the onion is the most acrid; in its boiled state the leek retains its acrimony most tenaciously. On account of this, and some difference of texture, the onion is more easily digested and more universally used than the leek; being more easily broken down, and more generally agreeable.

OXION RIVER, a river of Vermont, which is formed in Cabot, passes by Montpelier, and runs west into lake Champlain, four miles northwest of Burlington, North America. It is one of the principal rivers of Vermont, and flows through a fertile country. Between Colchester and Burlington it has worn through a solid rock of lime stone, forming a chasm seventy or eighty feet deep, and at Bolton there is another similar chasm. Length seventy miles.

OMISCUS, in zoology, a genus of insects belonging to the order of aptera. It has fourteen legs, bristly feelers, and an oval body. The most remarkable species are these:—

1. *O. aquaticus*, of an ashen color, and tolerably smooth. Its body is composed of seven articulations, exclusive of the head and tail; which last part is much larger than the other segments, round at the extremity, from which issue two appendices, each divided into two threads. It has seven legs on each side; the last of which gradually increase in length, and are constantly larger than the foremost. The antennæ have but three long articulations, the last of which is much longer than the rest. This insect is found in pools, small rivulets, and especially in springs.

2. *O. armadillo* is broad, very glossy, and smooth; its color is black, with a small portion of white on the edge of the segment, which color often varies; but still the insect is glossy and smooth. Its body is composed of ten segments, besides the head and tail. Of the ten segments, the first seven are broad, and the last three short. The first of these three appears divided in the middle, which is broader than the rest, into three more. These last short segments, with that of the tail, form the extremity of the body, which is round, without any appendix, and constitutes the specific character of this insect. It has fourteen feet, seven on each side. When touched, it rolls itself up into a ball, bringing its head and tail together like the armadillo, and neither antennæ nor feet are seen: it might be taken for a round shining pearl. It is found in woods.

3. *O. asellus*, millepeæ, or wood-louse, is oval; the tail obtuse, with two undivided bristles; various as to color; length, five lines.

4. *O. entomon*, the sea wood-louse, is white; eyes black; convex above, beneath flat, margin acute; antennæ four; four hind pair of legs largest, hairy. Body of ten segments. Length one line and a half. Found on the coast. It accompanies the herring, and is an enemy well known

to our fishermen: these insects will frequently eat up a whole fish while it hangs in the net.

ONKELOS, surnamed the Proselyte, a famous rabbi of the first century, and the author of the Chaldee Targum on the Pentateuch. He flourished in the time of Jesus Christ, according to the Jewish writers. The Talmudists tell us that he assisted at the funeral of Gamaliel, and was at a very large expense to make it magnificent.

ONLY, *adj. & adv.* From one. Single; sole; this, emphatically: one-like; simply; singly; merely; so and no otherwise.

Every imagination of the thoughts of his heart was *only* evil continually. *Genesis*, vi. 5.

The *only* child of shadeful Saverlake. *Dryden*.

The posterity of the wicked inherit the fruit of their father's vices; and that not *only* by a just judgment, but from the natural course of things. *Tillotson*.

All who deserve his love, he makes his own; And, to be loved himself, needs *only* to be known. *Dryden*.

Of all whom fortune to my sword did bring, This *only* man was worth the conquering. *Id.*

The logic now in use has long possessed the chair, as the *only* art taught in the schools for the direction of the mind in the study of the sciences. *Locke*.

I propose my thoughts *only* as conjectures. *Burnet*.

Nor must this contrition be exercised by us *only* for grosser evils; but when we live the best. *Wake*.

To maintain a character then with decency, we must keep our eye *only* upon that which is proper to it. *Mason*.

Can you resolve on shame? that *only* ill The generous fear that kills the soul itself. *Thomson*.

By numbers here from shame or censure free, All crimes are safe, but hated poverty. This, *only* this, the rigid law pursues; This, *only* this, provokes the snarling muse. *Johnson*.

Arts once esteemed may be with shame dismissed; Charity may relax the miser's fist; The gamester may have cast his cards away, Forgotten to curse, and *only* kneel to pray. *Cowper*.

ONOMACRITUS, an Athenian soothsayer who flourished under Pisistratus and his sons, about A. A. C. 516. He is generally believed to have been the author of the Greek poem on the Expedition of the Argonauts, which bears the name of Orpheus; as well as of the elegant poems still extant under the name of Musæus. He was exiled by Hipparchus. *Herod.* vii. 6.

ON'OMANCY, *n. s.* } *Gr. ονομα*, name and
ONOMANTICAL. } *μαντις*, divination.
Prediction by names.

Destinies were superstitiously, by *onomancy*, deciphered out of names, as though the names and natures of men were suitable, and fatal necessities concurred herein with voluntary motion. *Camden*.

Theodatus, when curious to know the success of his wars against the Romans, an *onomantical* or name-wisard Jew, willed him to shut up a number of swine, and give some of them Roman names, others Gothic names with several marks, and there to leave them. *Camden*.

ONOMANCY, **ONOMANTIA**, or **ONOMANCIA**, a branch of divination, which foretels the good or bad fortune of a man from the letters in his name. From the same principle the young Romans drank to their mistresses as often as

there were letters in their names: hence Martial says, *Naevia sex cyathis, septem Justina bibatur*.

ONON, a river of Asiatic Russia, on the frontier of Chinese Tartary. It rises in a mountainous country, and flows north-east till, combined with the Ingoda, it forms the Chilka, which afterwards discharges itself into the Amour. Its waters abound in fish, and throw on shore fragments of cornelian, chalcedony, and jasper. The banks are chiefly occupied by tribes of wandering Bannats, Tunguses, &c.

ONONDAGA, a county of New York, bounded north by Oswego county, east by Madison county, south by Courtland county, and west by Cayuga county. Population 25,987.

ONONDAGA, a post town, the capital of Onondaga county, New York, fifty miles west of Utica, 145 west of Albany. It is a large, valuable, and flourishing town, and has two villages, Onondaga Hollow, and West Hill. The latter, which is two miles west of the former, contains a court house, a jail, printing-office, &c. Onondaga Hollow contains a state arsenal, an academy, a meeting-house, a printing-office, and considerable manufactures. 200 of the Onondaga Indians live three miles south of this village; 200 of the same tribe reside on Buffalo Creek, 100 on the Alleghany, and 100 on the Ouse, in Upper Canada.

ONONDAGA, or Salt Lake, a lake in Onondaga county; seven miles north of Onondaga; seven miles long, and two broad. It discharges its waters from the north end into Seneca River. On its borders are celebrated salt springs.

ONONIS, in botany, a genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the thirty-second order, papilionaceæ. The calyx is quinquepartite, with the segments linear; the vexillum striated; the legumen turgid and sessile; the filaments coalited without a fissure.

ONOPORDUM, woolly thistle, in botany, a genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the forty-ninth order, compositæ. The receptacle is honey-combed; the scales of the calyx mucronated or pointed.

ONORE, or HONAVUR, a sea-port of North Canara, Hindostan, standing at the mouth of a small river which communicates with a fine salt water lake. This lake extends nearly as far to the east as the foot of the mountains, and is studded with islands. The fish are salted by the natives, and form a considerable article of trade. The country also produces much pepper and rice. Ships may anchor to the south of Fortified Island, at the distance of one mile and a half, or two miles, from the shore, in five or six fathoms water. Onore, when the Portuguese first arrived in India, was the seat of an independent rajah, whom they subdued, and built a fortress here. It was subsequently taken from them by the Dutch, who relinquished it; for in 1763 it was taken by Hyder Aly, and then considered one of the possessions of the ranees of Bednore. Hyder caused docks to be erected here for the purpose of building ships of war;

but in the year 1768 it was taken by the British, and the buildings destroyed; shortly after which it was retaken by Hyder. In 1783 it was retaken by the British under general Matthews, who found five ships of war, and a number of small vessels; but it was restored to Tippoo on the conclusion of the peace. The sultan, convinced of the impracticability of forming a marine at that place, withdrew the artificers, and, with the province of Canara, it came into British possession in 1799.

ONOSANDER, a Greek author and Platonic philosopher, who wrote Commentaries on Plato's politics, which are lost; but particularly famous for a treatise entitled *Λογος Στρατηγικος*, 'Of the Duty and Virtues of the General of an Army;' which has been translated into Italian, Spanish, and French. The time when he lived is not precisely known; but is imagined to have been in the reign of Claudius I.

ONOSMA, in botany, a genus of the monocynia order, belonging to the pentandria class of plants; and in the natural method ranking under the forty-first order, asperifoliæ. The corolla is campanulated, with the throat pærvous: there are four seeds.

ON'SET, *n. s. & v. a.* On and set. A set on; attack; assault; first brunt: to assault.

As well the soldier dieth, which standeth still, as he that gives the bravest onset. *Sidney.*

All breathless, weary, faint,
Him spying, with fresh onset he assailed,
And kindling new his courage, seeming quaint,
Struck him so hugely, that through great restraint.
He made him stoop. *Spenser.*

I will with deeds requite thy gentleness;
And for an onset, Titus, to advance
Thy name and honourable family,
Lavinia will I make my empress. *Shakespeare.*

This for a while was hotly unsettled and a reasonable price offered, but soon cooled again. *Carew.*

The shout
Of battle now began, and rushing sound
Of onset. *Milton's Paradise Lost.*

Sometimes it gains a point; and presently it finds itself baffled and beaten off; yet still it renews the onset; attacks the difficulty afresh; plants this reasoning and that argument, like so many intellectual batteries, till at length it forces a way into the obstinate enclosed truth. *South.*

Without men and provisions it is impossible to secure conquests that are made in the first onsets of an invasion. *Addison.*

Observe
The first impetuous onsets of his grief;
Use every artifice to keep him stedfast. *Philips.*

ON'SLAUGHT, *n. s.* On and slay. See SLAUGHTER. Attack; storm; onset. Not in use.

They made a halt
To view the ground, and where t' assault,
Then called a council, which was best,
By siege or onslaught to invest
The enemy; and 'twas agreed
By storm and onslaught to proceed. *Hudibras.*

ONSLow, a county, south part of North Carolina, on the coast. Population 6669. Slaves 2299. Chief town Swansborough.

ONTARIO, LAKE, one of that great northern chain which divides the United States from

Upper Canada. In length it is 171 miles, its greatest breadth fifty-nine and a half, and it is 467 in circumference; the depth of water varies, but it is seldom less than three, or more than fifty fathoms, except in the middle, where attempts have been made with 300 fathoms, without striking. Its bearing is nearly east and west. Towards the south and in the north-east the shores are low and marshy; to the north and north-west they assume a lofty character. The country around is covered with wood, except where patches of settlements diversify the scene. Of the many rivers flowing into Lake Ontario there are none that lay claim to notice but the Genesee and Oswego: but there are some fine bays and inlets. Burlington Bay is both spacious and secure; but its entrance is narrow, and so shallow as to admit nothing larger than boats. Hungry Bay, on the contrary, affords good anchorage and safe shelter among the islands, to ships of the largest size. York and Kingston harbours, belonging to the English, and Sacket's harbour to the Americans, are unquestionably the best upon the lake. The two latter are strongly fortified. Very heavy squalls of wind occur here, but they are unattended either with difficulty or danger. Of the many islands at the east end the Grand Isle, which lies immediately at the outlet of the lake into the St. Lawrence, is the most considerable: and, below this, the islands are so numerous in the channel of the St. Lawrence that they have received the appellation of the Thousand Isles. The Ontario lake discharges its waters into the St. Lawrence from the north-east end, and communicates with Lake Erie at the south-west part, by the Niagara. Long. 76° 30' to 80° W., lat. 43° 15' to 44° N.

ONTARIO, a county of New York, bounded north by the above lake, east by Seneca county, south by Steuben and Allegany counties, and west by Genesee county. Canadoqua is the capital. Also a county of Upper Canada, consisting of islands in Lake Ontario.

ONTIGOLA, a well-built village of Spain, three miles east of Aranjuez, on a small lake of the same name. The foreign envoys reside here, when the court is at Aranjuez.

ONTINIENTE, a considerable manufacturing town of Valencia, Spain, is situated in a mountainous and fertile neighbourhood. It is an inland place, twelve miles south-west of the town of San Felipe; than which, though nearly as populous, as it contains about 11,000 inhabitants, it is much less known, from being unfortified and distant from any sea-port. Its inhabitants carry on manufactures of woollen, paper, and copper. The variety of temperature gives rise to a considerable diversity in the fruits, the lower grounds producing figs; the higher pears, apples, and other products of a colder climate.

ONTOLOGY, *n. s.* } *Gr. ontologia.* The
ONTOLOGIST. } science of the general
 affections of being. **METAPHYSICS**, which see.

The modes, accidents, and relations that belong to various beings, are copiously treated of in metaphysics, or more properly *ontology*. *Watts's Logic.*

Others, with more propriety, conceive metaphysics

to be what some others call *ontology*, or *ontosophy*.
i. e. the doctrine de ente, or of being, quatenus being.
Dr. A. Rees.

ONUPHRIUS PANVINUS, a learned Italian, of the order of hermits of St. Augustine. He was born of a noble family at Verona in 1529; and became so indefatigable in his studies that he spent whole days and nights in reading the ancients; which made Manutius style him *Helluo Antiquitatis*. His first performance was *A Chronicle of Popes and Cardinals*, which was printed without his knowledge at Venice in 1557, and some time after more correctly by himself. He afterwards continued *Platina's Lives of the Popes*, from Sextus IV. to Pius V., and subjoined annotations. He also wrote four pieces upon Roman Antiquities, which are printed in Grævius's Collection. He died in his thirty-ninth year in 1568.

ONYCHA, *n. s.* *Gr. ονυχα.* A fragrant gum. See below.

Take sweet spices, *onycha*, and galbanum. *Exodus.*

ONYCOMANCY, or **ONYMANCY**, a kind of divination by the nails of the fingers. The word is from the Greek *ονυξ*, nail, and *μαντια*, divination. The ancient practice was to rub the nails of a youth with oil and soot, or wax; and to hold up the nails thus smeared against the sun. Upon them were supposed to appear figures or characters which showed the thing required.

O'NYX, *n. s.* *Gr. ονυξ.* A gum. See below.

Nor are her rare endowments to be sold
 For glittering sand by Ophir shown,
 The blue-eyed saphir, or rich *onyx* stone.

Sandys.

The *onyx* is an accidental variety of the agate kind: it is of a dark horny colour, in which is a plate of a bluish white, and sometimes of red: when on one or both sides the white there happens to lie also a plate of a reddish or fresh colour, the jewellers call the stone a *sardonix*. *Woodward on Fossils.*

ONYX, in lithology, one of the semipellucid gems, with variously colored zones, but none red. There are four varieties of this gem. 1. A bluish white one, with broad white zones: 2. A very pure onyx, with snow-white veins: 3. The *jasponyx*, or *horny onyx*, with green zones: 4. The brown onyx, with bluish white zones. The ancients attributed wonderful properties to the onyx, and imagined that if worn on the finger it acted as a cardiac; they also recommended it as an astringent; but at present no regard is paid to it. The word *ονυξ* signifies nail; the poets feigning this stone to have been formed by the *Parcæ* from a piece of *Venus's* nail, cut off by *Cupid* with one of his arrows.

ONYX, in ichthyology, or the *onyx* fish, found in the Red Sea, and has the property of being uncommonly odoriferous, whence it is a principal ingredient in the Indian perfumes. We have met with no description of it.

OOCHINADROOG, **UJAYINI DURGA**, a strong hill fort in the Balaghaut territories, district of Harponully. Lat. 14° 32' N., long. 75° 55' E. This fortress is situated about twelve miles to the eastward of Hurryhur, and has the appearance of great strength; being of consider-

able height, unconnected and abrupt, particularly to the northward and westward, where it is almost perpendicular. When Tippoo besieged a rebel Hindoo chief here in 1793 he was so enraged at the garrison holding out for three months that on its capitulating he ordered all the boys to be made eunuchs: very few, it is said, survived.

OOJAIN, OJJEIN, or UGEEN, a large district and city of Hindostan, in the province of Malwah, situated between 23° and 24° N. lat., and between 75° and 77° E. long. The soil is in general a soft black mould, and the roads are nearly impassable in the wet season. It contains, besides the city, 175 villages; but most of the lands are let on a feudal tenure, and it only yields a revenue of about £60,000 per annum. It was formerly the private estate of the Mahratta Dowlut Row Sindia. The capital is situated on the banks of the Sipperah, in lat. 23° 12' N., long. 75° 50' E., and is one of the most ancient cities of Hindostan. It was known to the Greeks as Ozene; and its Sanscrit name is Ujayini. It is stated to have been the capital of rajah Bickermajit, a short time after the commencement of the Christian era. The ancient city stood about a mile north of the present; and perhaps was much larger; for, on digging to the depth of fifteen feet, brick walls, pillars of stone, and other ruins, are frequently discovered here. Adjoining to these ruins, near the bank of the river, is the remarkable cavern rajah Bhirtery's cave. It consists of a long gallery, supported by pillars, with chambers on each side containing a number of figures carved on the granite walls. At some distance, and in an island of the river, there is a subterranean palace, built about the year 1500, by sultan Nasir Addeen Khilije, king of Malebah, who, having contracted an intolerable heat of constitution by the use of mercury, used to spend the hot season of the year in this place, around every apartment of which the water flowed in various channels. The fine state of these works, now above 300 years old, is surprising.

The modern Oojain is of an oblong form, about six miles in circumference, surrounded by a stone wall with towers. The principal bazaar is a spacious and regular street, paved with stone, and having houses of two stories in height on each side. The houses are generally built of brick, and tiled. The whole of the lower story is laid out in shops; the upper ones are dwellings. The principal buildings in the town are the mosques and temples. The palace makes but a poor figure. The southern quarter, called Jeyasingpoor, contains an observatory erected by rajah Jyasing of Jyenagur. See our article **OBSERVATORY**. Two miles from the city the late Mahadajee Sindia laid the foundation of an extensive fort, citadel, and palace; but his death put a stop to the works.

OON, a town of Hindostan, in the province of Gujerat, noted for the thievish disposition of its inhabitants, who are mostly of the lowest classes of Hindoos. It contains about 2000 tolerable houses, and the palace of the rajah. The chief is a Hindoo of the low tribe of Coolee: his income is said to amount to 12,000 rupees per

annum; a moiety of which is supposed to be derived from his share of the plunder of his neighbours. Long, 71° 45' E., lat. 24° 15' N.

OORT (Adam Van), the son of Lambert Van Oort, a painter of considerable reputation for perspective and architecture, was born at Antwerp in 1557. He was instructed in the art by his father, and soon rose into esteem, not only as a painter of history, but of landscape and portraits. But the greatest honor of Van Oort is, that he was the first instructor of Rubens, whose works have eternised his master's memory, along with his own. He painted a great number of designs for the altars of churches in Flanders, which have much merit, and are still beheld with pleasure by good judges. He was a mannerist.

OOSCAT, a town of Anatolia, in Asia Minor. It has been almost entirely rebuilt in modern times. It is situated in a hollow, surrounded on all sides by barren hills, but is said to contain 16,000 inhabitants, of which the greater proportion are Turks; the remainder are Greeks, Armenians, and Jews. The houses, though small, are neat and painted in the manner of those at Constantinople. The palace is an extensive building of brick and wood, two stories high, in the centre of the town. A handsome mosque has lately been erected of hewn stone, in imitation of St. Sophia. The defences consist of a slight wall, built of sun-dried brick and mud; and in certain open spots large wooden granaries have been erected. 110 miles east of Angora. Lat. 39° 42' N.

OOSCOTTA, a small fortress of the south of India, province of Mysore. We first read of this place in 1688, when it was in possession of the Mahrattas. In 1757 it was taken from them by the nabob of Cuddapah, but retaken by the Mahrattas. In 1761 it was besieged and taken by Hyder Aly and the brother of the Nizam. Seven years after this the British got possession of it; but in 1773 it was recovered by Hyder. The events of the war of 1799 again threw it into our hands, by whom it was made over, along with the province, to the young rajah of Mysore. It is a place of considerable strength, and stands fifteen miles north-east of Bangalore.

OOST (James Van), a painter of history, landscape, and architecture, born at Bruges about 1600. He learned the art in his native city, but travelled to Italy to study the works of the great masters. Among these he attached himself particularly to the style of Annibal Carracci, and imitated him in such a manner as to surprise the most able connoisseurs at Rome. He died in 1671.

OOZE, *n. s. & v. n.* } Saxon *per*, wetness.
Oo'ze, adj. } Mud or mire in a soft state; slime: hence, soft flow; to flow softly; drain away.

My son i' the' *ooze* is bedded. *Shakespeare.*
 Some carried up into their grounds the *ooze* of salt water mud, and found good profit thereby.

Carrow.
 Old father Thames raised up his reverend head,
 Deep in his *ooze* he sought his sedge bed,
 And shrunk his waters back into his urn. *Dryden.*
 When the contracted limbs were cramped, even then

A waterish humour swelled and *oozed* agen. *Id.*

From his first fountain and beginning ooze,
Down to the sea each brook and torrent flows.

Prior.

From his oozy bed,
Old father Thames raised up his reverend head.

Pope.

The lily drinks
The latent rill, scarce oozing thro' the grass.

Thomson.

At once he darts along
Deep struck, and runs out all the lengthened line,
Then seeks the furthest ooze and sheltering weed,
The caverned bank, his old secure abode. Id.
Laughs the glad Thames, and clasps each fair
one's charms,
They scream and scramble in his oozy arms.

Canning.

OPA'CATE, *v. a.* } Lat. *opaco*. To shade;
OPA'CITY, *n. s.* } cloud; obscure: opacity
OPA'COUS, *adj.* } is, cloudiness; darkness;
OPAQUE. } want of transparency; and
opacous, opaque, the corresponding adjectives.

When he perceives that *opacous* bodies do not
hinder the eye from judging light to have an equal
diffusion through the whole place that it irradiates,
he can have no difficulty to allow air, that is dia-
phaneous, and more subtle far than they, and conse-
quently divisible into lesser atoms; and having
lesser pores, gives less scope to our eyes to miss light.

Digby.

Upon the firm *opacous* globe
Of this round world, whose first convex divides
The luminous inferior orbs, inclosed
From chaos, and the' inroad of darkness old,
Satan alighted. Milton's Paradise Lost.

They

Shot upward still direct, whence no way round
Shadow from body *opaque* can fall. Milton.
Can any thing escape eyes in whose optics there
is no *opacity*? Browns.

Had there not been any night, shadow, or *opacity*,
we should never have had any determinate conceit
of darkness. Glanville.

How much any body hath of colour, so much hath
it of *opacity*, and by so much the more unfit is it to
transmit the species. Ray.

The least parts of almost all bodies are in some
measure transparent; and the *opacity* of those bodies
ariseeth from the multitude of reflexions caused in
their internal parts. Newton.

These disappearing fixt stars were actually extin-
guished and turned into more *opaque* and gross plan-
et-like bodies. Cheyne.

In a great work there is a vicissitude of luminous
and *opaque* parts, as there is in the world a succes-
sion of day and night. Johnson.

The whole of the choroides is *opaque*, by which
means no light is allowed to enter into the eye, but
what passes through the pupil. To render this
opacity more perfect, and the chamber of the eye still
darker, the posterior surface of this membrane is cov-
ered all over with a black mucus, called the *pigmen-
tum nigrum*. Imison.

OPAL, *n. s.* Lat. *opalus*. A kind of gem.
See below.

Thy mind is a very *opal*.

Shakspeare. Twelfth Night.

The' empyreal heaven, extended wide
In circuit, undetermined square or round;
With *opal* towers, and battlements adorned
Of living saphir. Milton's Paradise Lost.

We have this stone from Germany, and it is
some with the *opal* of the ancients. Woodward.

OPAL, in mineralogy, a sub-species of the
indivisible quartz of Mohs. See MINERALOGY.
Of this stone there are six different kinds, as
follows:—

1. Precious opal. Color milk-white, inclin-
ing to blue. It exhibits a beautiful play of
many colors. Massive, disseminated, in plates
and veins. Lustre splendid. Fracture perfect
conchoidal. Translucent, or semitransparent.
Semi-hard in a high degree. Brittle. Uncom-
monly easily frangible. Specific gravity 2.1.
Before the blow-pipe it whitens and becomes
opaque, but does not fuse. Its constituents are,
silica 90, water 10. It occurs in small veins in
clay porphyry, with semi-opal, at Czscherwenitz,
in Upper Hungary; and in trap rocks at Sandy
Brae, in the north of Ireland. Some of them
become transparent by immersion in water; and
are called *oculus mundi*, *hydrophane*, or *change-
able opal*.

2. Common opal. Color milk-white. Mas-
sive, disseminated, and in angular pieces. Lus-
tre splendid. Fracture perfect conchoidal.
Semitransparent. Scratches glass. Brittle.
Adheres to the tongue. Infusible. Its constitu-
ents are, according to Klaproth, silica 93.5, oxide
of iron 1, water 5. It occurs in veins along
with precious opal in clay porphyry, and in me-
talliferous veins in Cornwall, Iceland, and the
north of Ireland.

3. Fire opal. Color hyacinth-red. Lustre
splendent. In distinct concretions. Fracture
perfect conchoidal. Completely transparent.
Hard. Uncommonly easily frangible. Specific
gravity 2.12. Heat changes the color to pale
flesh-red. Its constituents are, silica 92, water
7.75, iron 0.25. It has been found only at
Zimapan in Mexico, in a particular variety of
hornstone porphyry.

4. Semi-opal. Colors white, gray, and brown;
sometimes in spotted, striped, or clouded deli-
neations. Massive, disseminated, and in imita-
tive shapes. Lustre glistening. Fracture con-
choidal. Translucent. Semi-hard. Rather
easily frangible. Specific gravity 2.0. Infusi-
ble. Its constituents are, silica 85, alumina 3,
oxide of iron 1.75, carbon 5, ammoniacal water
8, bituminous oil 0.33.—Klaproth. It occurs
in porphyry and amygdaloid, in Greenland,
Iceland, and Scotland, in the Isle of Rume, &c.

5. Jasper opal, or Ferruginous opal. Color
scarlet-red, and gray. Massive. Lustre shining.
Fracture perfect conchoidal. Opaque. Between
hard and semi-hard. Easily frangible. Specific
gravity 2.0. Infusible. Its constituents are,
silica 43.5, oxide of iron 47.0, water 7.5.—
Klaproth. It is found in porphyry at Tokay in
Hungary.

6. Wood opal. Colors very various. In
branched pieces and stems. Lustre shining.
Fracture conchoidal. Translucent. Semihard
in a high degree. Easily frangible. Specific
gravity 2.1. It is found in alluvial land at
Zastravia in Hungary. Opals are generally dis-
covered in detached pieces, in an envelop of a
different kind of stone, from the size of a pin's
head to that of a walnut. Beautiful opals of
this last size are extremely rare: so that it is
difficult to find an opal sufficiently perfect and

large to be completely possessed of all its beauties. This renders it so precious, and makes it indeed almost impossible to determine its value. It has, however, we believe, been agreed to estimate a beautiful oriental opal at double the price of a sapphire of the same dimensions.

The Russian general, Prince Potemkin, purchased, for the sum of 1000 ducats, a stone of this kind, said to have been taken by the famous Nadir Shah from the head of a Gentoo idol, of which it formed one of the eyes. By what circuitous road it found its way to the Russian prince does not appear: but it is said to have disappeared, together with many other gems, from the tent of the Persian conqueror, when he was assassinated. It is related that Nonnius, a Roman senator, seemed willing rather to forfeit his life than to cede an opal to Marc Antony.

Opal, says Mr. Jameson, which is a hydrate of silica, and eminently distinguished by the beauty of its range of external characters, occurs in small veins and imbedded portions, in various primitive rocks. But its principal distribution is in rocks of the secondary class, particularly in traps and porphyries. In these it is arranged in veins, drusy cavities, and imbedded masses, and assumes the various forms of precious opal, common opal, semi-opal, wood-opal, and menilite. The menilite and wood-opal are the most modern of these,—the first occurring imbedded in the adhesive slate of the Paris formation, the other in tuffaceous rocks, of the nature of trachyte. The opals are found sometimes so soft that they can be flattened between the fingers. The alluvial rocks are not without opal, for it is daily forming by deposition from the waters of various springs, particularly hot springs, as those of Iceland. From the magnitude and abundance of these springs, in many regions of the earth, and the quantity of siliceous matter they deposit, we can form a general estimate of the great quantity of opaline matter formed in this way. Opal indeed is one of those minerals which have an extensive geognostical range, and which are still forming in the mineral kingdom; but one of the most interesting features in its natural history remains to be noticed, viz. its formation by the organic powers of plants. It is well known to botanists that silica occurs in considerable abundance in several tribes of plants, and that it communicates to the parts of the plants containing it a considerable degree of hardness. The bamboo is one of the most remarkable in this respect, as the earth it contains occurs not only in the vegetable structure itself, but is secreted from it, and appears in the joints of the plant, in solid masses, named *Tabasheer*, and which bear a strong resemblance to opal.

The most celebrated locality for opals is the village named *Cservenicza* by the Slavonians, about two miles from *Kaschau*, in the trachytic range, which extends from *Tokoj* to *Epériés*. It appears that these mines have been wrought for many ages; for *Fichtel* asserts that, in the archives of *Kaschau*, there exist papers which mention that, in the year 1400, there were 300 workmen employed in the country of *Cservenitza*,

as well for the working of opal as for that of mercury. At the present day there are not more than thirty, but the working begins to be conducted with regularity.

The varieties which are most abundant are, the opaque opal, of a yellowish or reddish white, and the milky opal, which is more or less translucent. The latter becomes sometimes more or less dull, and assumes the characters of certain whitish menilite of the neighbourhood of Paris. The fire-opal, of a beautiful topaz yellow-color, with great lustre, and equally beautiful with that which *M. De Humboldt* discovered at Mexico, is still pretty common; but the small masses in which it occurs are very much cracked, and it becomes almost impossible to cut them: it would, however, be a very beautiful stone, were it possible to procure pieces of tolerable size free of fissures. It appears that the yellow color is owing to iron; for this stone blackens quickly before the blowpipe. It is probable that the metal is here in the state of a hydrate, for it is thus that it occurs in the fissures of the rock where it is deposited by itself. Limpid opal, without color, occurs pretty frequently in the interior of small geodes, the mass of which consists of opaque or milky opal; it forms an undulated crust of greater or less thickness, which passes gradually into the preceding layer. Sometimes it occurs by itself in minute fissures; and at other times it is interposed in small layers in the substance of various kinds of opal. Stalactitic opal (*l'opal concretionnée*), transparent, translucent, or opaque, is still found in certain fissures of which it lines the walls, or in geodes; these are composed of small stalactites, which adhere more or less firmly to one another, and which, when limpid, differ in no respect from hyalite. They also assume a pearly lustre; when slightly heated, lose their coherence; and break into small scales when exposed to a red heat. Their aggregation gives rise to masses which have the appearance of being homogeneous, and present the aspect of opals similar to some one of the varieties already mentioned, and even to the iridescent opal. Sometimes the stalactites are extremely minute, and completely fill up the irregular cavities; the small fissures by which the siliceous matter has penetrated into the rock being equally filled.

In some instances, the opaline matter has formed on the walls of the fissures only a very thin layer, which presents the appearance of minute tortuous canals, having their surface covered with very minute stalactitic points lying lengthwise. These surfaces often present the aspect of certain earthy pumices, with elongated and tortuous vesicular cavities. Iridescent opal (*l'opale irisée*), which is the principal object of research, is also plentifully disseminated in the rocks, but almost always in extremely minute nests; it is very rarely that it occurs in large pieces, like the other varieties. The working sometimes goes on for years before a piece occurs of the size of a twenty sous piece. The largest which has ever been found is that of the imperial cabinet of Vienna; it is of the size of one's fist, and weighs seventeen ounces. This magnificent specimen has been known at Vienna

for more than two centuries, and it is neither known at what period, nor how it was obtained. It is polished irregularly to avoid diminishing its size. There are many fissures in it, and it is not completely disengaged from the matrix. The colors presented by this kind of opal are extremely various; all the tints of blue, violet, red, yellow, green, &c., are blended in a thousand different ways, and present the most brilliant and agreeable reflections. This beautiful stone is also in great request, and always maintains a high price; the smallest, when beautiful, do not sell for less than four to five guineas; and, when the dimensions are large, the value augments altogether beyond proportion. There is a very beautiful specimen at Kaschaa, of the size of a small crown piece, for which 30,000 florins (or 79,000 francs) were offered.

The iridescent colors presented by opal are not assuredly owing to cracks or fissures, as has sometimes been said; for there is not the least appearance of fissure to be seen in the most beautiful specimens; the smallest fragments into which a piece may be broken present exactly the same play of light as the largest. This play of light is explained, in a less forced manner, by the unequal distribution of vacuities, of different sizes, in which water is found enclosed; it is easy, from the colors observed, to estimate the size, or rather the degree of minuteness, of these vacuities, proceeding upon the Newtonian theory of colored rings.

Ferruginous opal also occurs pretty frequently in the same veins as the other varieties: it is impregnated with a greater or less quantity of hydrate of iron, which has probably been simultaneously deposited, or into which the siliceous matter may have been subsequently infiltrated. Sometimes the appearance is that of a dull opaque opal, slightly colored with yellow; but we find, in the same nests, the quantity of iron augmenting by little and little, and often we find nothing but an opal-jasper. Sometimes the iron becomes so abundant that the opaline matter discovers itself only by the resinous lustre which it communicates to the mass.

Opaque opal, more or less colored, and opal-jasper, by impregnating wood buried in the midst of pumiceous debris, have given rise to opalised wood (Holzopal, Wern.), which, as we know, presents a great variety of colors, and degrees of lustre. It is evident that the wood, in this case, has merely served as the receptacle of the siliceous matter which has been successively infiltrated, and in the same manner as it has formed in kidneys in the same conglomerates, or been deposited in the fissures of rocks. The organic nature of the bodies for which the silica has been substituted, in this case, has had no sort of influence on the modification which reduces it to the state of opal, since it presents itself with the same characters, in nests or in veins, in the neighbouring parts where no organic debris is found to receive it. A single difference that is observed here, and which still proves that the petrification is owing to the infiltration of siliceous matter, is, that this is in some measure pure, and is found disengaged

from extraneous matter as by a filter. The greater part also of the opalised wood which has been collected has a more or less determinate translucidity; the matter is commonly harder, and, whatever the color may be, the powder does not stain the fingers like that of the ferruginous opal-jaspers. Sometimes perfectly transparent opal is observed in the cavities of wood, in small undulated nests, or in stalactites.

The colors which these opalised woods present are extremely numerous; sometimes they are absolutely white, and sometimes they assume very deep colors, yellow, red, brown, green, as well as all the intermediate tints, resulting from the mixture of these principal colors. The same piece of wood, if it be of considerable size, as sometimes happens, presents colors altogether different in their different parts, as well as more or less translucidity or opacity. In many cases the texture of the wood is completely preserved; and, when the color is also retained in an equal degree, it is impossible to distinguish by mere inspection the petrified specimens from those which are in their original unaltered state.

OPARO, a mountainous island in the Pacific Ocean, discovered by Vancouver in December 1791. Its high craggy mountains form most romantic pinnacles, with perpendicular cliffs, and the vacancies between may more properly be termed chasms than valleys, as they have no appearance of cultivation or fertility; and are chiefly clothed with shrubs and dwarf trees. On all of them people were observed, as if on duty, constantly moving about. Captain Vancouver saw about thirty double and single canoes, which were mostly built after the model of those in the Society Islands. The natives he estimated at 1500, who appeared to be extremely well fed. Long 215° 58' E., lat. 27° 36' S.

Sax. *ope*, open; Gothic and Belgic *open*; Swed. *open*. To uncloise; uncover; divide; unlock; show; explain; disclose: to uncloise itself; not to remain close or concealed; to bark (a hunting term): as an adjective, unclosed; plain; apparent; public; clear: the compounds and derivatives follow these senses.

If a man shall open a pit and not cover it, and an ox fall therein, the owner of the pit shall make it good. *Eccodus* xxi. 33.

The eyes of the Lord are upon the righteous, and his ears are open unto their cry. *Psalms* xxxiv.

If Demetrius and the craftsmen have a matter against any man, the law is open, and there are deputies; let them implead one another. *Acts* xix.

He was so secret therein, as not daring to be open, that to no creature he ever spake of it. *Sidney*.

Some things wisdom openeth by the sacred books of Scripture, some things by the glorious works of nature. *Hooker*.

Prayers are faulty, not whensoever they be openly made, but when hypocrisy is the cause of open praying. *Id.*

The world's mine oyster,
Which I with sword will open. *Shakespeare.*
If I cry out thus upon no trail, never trust me
when I open again. *Id. Merry Wives of Windsor.*
The gates are open; now prove good seconds;
'Tis for the followers fortune widens them,
Not for the fiers. *Id. Coriolanus.*

The service that I truly did his life,
Hath left me open to all injuries. *Shakespeare.*
Deliver with more openness your answers
To my demands. *Id. Cymbeline.*
Why should you have put me to deny
This claim which now you wear so openly?
Shakespeare.

To us, the' imagined voice of heaven itself;
The very opener and intelligencer
Between the grace, the sanctities of heaven,
And our dull workings. *Id. Henry IV.*

While you here do snoring lie,
Open-eyed conspiracy
His time doth take. *Id. Tempest.*
An open and warm winter portendeth a hot and
dry summer. *Bacon's Natural History.*

Lord Cordes, the hotter he was against the English
in time of war, had the more credit in a negotiation
of peace; and besides was held a man open and of
good faith. *Bacon.*

After the earl of Lincoln was slain, the king opened
himself to some of his council, that he was sorry for
the earl's death, because by him he might have known
the bottom of his danger. *Id.*

He irefully enraged would needs to open arms.
Drayton.

Gramont, governor of Bayonne, took an exquisite
notice of their persons and behaviour, and opened
himself to some of his train, that he thought them to
be gentlemen of much more worth than their habits
betrayed. *Wotton.*

The English did adventure far for to open the
north parts of America.

Abbot's Description of the World.
The under-work, transparent, shews too plain:
Where open acts accuse, the' excuse is vain. *Daniel.*
Adam, now open thine eyes; and first behold
The' effects which thy original crime hath wrought
In some to spring from thee. *Milton's Paradise Lost.*

True opener of mine eyes,
Much better seems this vision, and more hope
Of peaceful days portends, than those two past.
Milton.

I knew the time,
Now full, that I no more should live obscure,
But openly begin, as best becomes
The authority which I derived from heaven. *Id.*
The draw-bridges at Amsterdam part in the middle,
and a vessel, though under sail, may pass them with-
out the help of any one on shore; for the mast-head,
or breakwater of the ship, bearing against the bridge
in the middle, opens it. *Browne.*

There may be such openers of compound bodies,
because there wanted not some experiments in which
it appeared. *Boyle.*

How grossly and openly do many of us contradict
the precepts of the gospel, by our ungodliness and
worldly lusts! *Tillotson.*

The night restores our actions done by day;
As hounds in sleep will open for their prey.
Dryden.

You retained him only for the opening of your
cause, and your main lawyer is yet behind. *Id.*

With dry eyes, and with an open look,
She met his glance midway. *Id. Boccaccio.*

Darah
Too openly does love and hatred show:
A bounteous master, but a deadly foe. *Dryden.*

They meet the chiefs returning from the fight,
And each with open arms embraced her chosen
knight. *Id.*

I know him well; he's free and openhearted. *Id.*
Up comes a lion openmouthed towards the ass.

L'Estrange.
Moral principles require reasoning and discourse
to discover the certainty of their truths; they lie not
open as natural characters engraven on the mind.
Locke.

God has been pleased to dissipate this confusion
and chaos, and to give us some openings, some dawn-
ings of liberty and settlement. *South's Sermons.*

In that little spot of ground, that lies between
those two great oceans of eternity, we are to exercise
our thoughts, and lay open the treasures of the divine
wisdom and goodness hid in this part of nature and
providence. *Burnet.*

Good heaven, who renders mercy back for mercy,
With openhanded bounty shall repay you. *Rouse.*

The French are always open, familiar, and talka-
tive; the Italians stiff, ceremonious, and reserved.
Addison.

The wall of the cathedral church was opened by an
earthquake, and shut again by a second. *Id.*

A friend who relates his success talks himself
into a new pleasure; and, by opening his misfortunes,
leaves part of them behind him. *Collier.*

The fire thus up, makes its way through the cracks
and openings of the earth. *Woodward.*

We express our thanks by openly owning our
parentage, and paying our common devotions to
God on this day's solemnity. *Atterbury.*

When the matter is made, the side must be opened
to let it out. *Arbuthnot on Aliments.*

Of an openhearted generous minister you are not to
say that he was in an intrigue to betray his country;
but in an intrigue with a lady. *Arbuthnot.*

Unnumbered treasures open at once,
From each she nicely culls with curious toil,
And decks the goddess.

Pope's Rape of the Lock.
These letters, all written in the openness of friend-
ship, will prove what were my real sentiments.
Id. Letters.

This reserved mysterious way of acting towards
persons, who in right of their posts expected a more
open treatment, was imputed to some hidden design.
Swift.

Hark! the dog opens, take thy certain aim;
The woodcock flutters. *Gay's Rural Sports.*
Give opening Hemus to my searching eye,
And high Olympus pouring many a stream.

Thomson.
This adroitness in breaking through fences was
termed 'getting her [the cow's] own living.' What
is scarcely credible, this character is openly given of
a cow, to enhance her value at a fair [in Ireland], by
one poor person to another. *Edgeworth.*

Look again at the same boy in the company of
those who inspire no terror: his countenance is open;
his altitude erect; his voice firm; his language free
and fluent; his thoughts are upon his lips; he speaks
truth without effort, without fear. *Id.*

Wise to promote whatever end he means,
God opens fruitful nature's various scenes:
Each climate needs what other climes produce,
And offers something to the general use;
No land but listens to the common call,
And in return receives supply from all. *Cooper.*
And thus ends the first part or beginning, which
is simple and unembellished, and opens the subject
in a natural and easy manner. *Canning.*

Though, by the respect of those at whose expense
it pleases them to be merry, they may be secured

from being rendered *openly* ridiculous; yet they may still be liable, and likely, to become secretly contemptible. *Id.*

If the ministers I have mentioned had pledged themselves—that the character of the Directory had something in it of peculiar candour, integrity, ingenuity, and *openness*, I should yet be willing to give credit to [this] retraction [of this opinion]. *Id.*

OPELEUSAS, a county and town in the south-west part of Louisiana, North America. Population 5048. The town is sixty miles west of Baton Rouge.

OPERA, *n. s.* Ital. *opera*, from the Lat. *opera*. A species of dramatic representation, defined in the extract from Dryden.

An *opera* is a poetical tale or fiction, represented by vocal and instrumental music, adorned with scenes, machines, and dancing. *Dryden.*

You will hear what plays were acted that week, which is the finest song in the *opera*. *Law.*

He was a critic upon *operas* too,
And knew all nations in the sock and buskin;
And no Venetian audience could endure a
Song scene, or air, when he cried seccatura.

Byron.

—I found by the discourse of the actors that there were great designs on foot for the improvement of the *opera*: that it had been proposed to break down a part of the wall, and to surprise the audience with a party of a hundred horse; and that there was actually a project of bringing the New River into the house, to be employed in jetties and water works.

Spectator.

An **OPERA** is a dramatic composition, set to music, and sung on the stage, accompanied with musical instruments, and enriched with magnificent dresses, machinery, and other decorations. See **MUSIC** and **POETRY**.

OPERA, ITALIAN. Italy, where music has always been cultivated with most success, was the birth-place of the opera, and thence it has been imported into every country where theatrical amusements are held in esteem. It was not attempted in England until the end of the seventeenth century; and its introduction experienced the opposition of those who then dictated on all subjects connected with literature. They justly ridiculed the monstrous absurdity of regulating the most serious events of tragedy by an orchestra; and even to the comic exhibitions they objected, on account of their being performed in a language not generally understood. They remonstrated on the impropriety of squandering away large sums of money on foreigners, and neglecting the merit of eminent British performers. The music, however, at the Italian opera, was so exquisite, that crowded audiences were never wanting. Fashion patronised it, and a succession of new performers gave it constantly increasing eclat. The establishment of this theatre is now extensive, and more brilliant than any in London. The scenery is most splendid, and the salaries of the performers are enormous. Not Rowe, not Sheridan, not Shakespeare, can prevent the English theatre from being considered a bore, which is only occasionally to be endured, while the dear delightful opera continues the nightly resort of rank and beauty. It is proper, however, to add, that at the King's Theatre a gratification is

afforded, in the ballet, to the eye as well as the ear; and more of the loungers who frequent the opera-houses are attracted by the luxurious display of female elegance, than by the magic of sweet sounds.

|---------------------------------|---|
| OPERATE , <i>v. n.</i> | } Lat. <i>operor</i> . To act; perform; have agency; taking on before the object: operable is practicable: operant and operative mean active; having causative power; vigorous: operation is action; efficacy or effect; agency: operator, he who performs or effects any thing: operose, laborious; tedious. |
| OP'ERABLE , <i>adj.</i> | |
| OP'ERANT , | |
| OPERATION , <i>n. s.</i> | |
| OP'ERATIVE , <i>adj.</i> | |
| OP'ERATOR , <i>n. s.</i> | |
| OP'EROSE , <i>adj.</i> | |

There are in men *operations* natural, rational, supernatural, some politick, some finally ecclesiastical. *Hooker.*

By all the *operations* of the orbs,
From whom we do exist and cease to be,
Here I disclaim all my paternal care. *Shakespeare.*

Earth, yield me roots!

Who seeks for better of thee, sauce his palate
With thy most *operant* poison. *Id. Timon.*

I must leave thee, love, and shortly too;
My *operant* powers their functions leave to do.

Shakespeare.

To be over curious in searching how God's all-piercing and *operative* spirit distinguishing gave form to the matter of the universal, is a search like unto his, who, not contented with a known ford, will presume to pass over the greatest rivers in all parts where he is ignorant of their depths. *Raleigh.*

All *operations* by transmission of spirits, and imagination, work at distance, and not at touch.

Bacon's Natural History.

Repentance and renovation consist not in the strife, wish, or purpose, but in the actual *operations* of good life. *Hammond.*

Waller's presence had an extraordinary *operation* to procure any thing desired. *Clarendon.*

Many of the nobility endeavoured to make themselves popular, by speaking in parliament against those things which were most grateful to his majesty; and he thought a little discountenance upon those persons would suppress that spirit within themselves, or make the poison less *operative* upon others. *Id.*

In actions of religion we should be zealous, active, and *operative*, so far as prudence will permit.

Taylor.

The tree whose *operation* brings
Knowledge of good and ill, shun to taste.

Milton.

Being incapable of *operable* circumstances, or rightly to judge the prudentiality of affairs, they only gaze upon the visible success, and thereafter condemn or cry up the whole progression. *Brown.*

The offices appointed, and the powers exercised in the church, by their institution and *operation* are holy. *Pearson.*

If the *operation* of these salts be in convenient glasses promoted by warmth, the ascending steams may easily be caught and reduced into a penetrant spirit. *Boyle.*

Written language, as it is more *operous*, so it is more digested, and is permanent. *Holder.*

Speculative painting, without the assistance of manual *operation*, can never attain to perfection, but slothfully languishes; for it was not with his tongue that Apelles performed his noble works. *Dryden.*

The pain and sickness caused by manna are the effects of its *operation* on the stomach and guts, by the size, motion, and figure of its insensible parts.

Locke.

Bodies produce ideas in us, manifestly by impulse, the only way which we can conceive bodies *operate* in.

Id.
The will is the conclusion of an *operative* syllogism.

Norris.

Such an explication is purely imaginary, and also very *operose*; they would be as hard put to it to get rid of this water, when the deluge was to cease, as they were at first to procure it.

Burnet.

It holds in all *operative* principles, especially in morality; in which, not to proceed is certainly to go backward.

South.

An imaginary *operator* opening the first with a great deal of nicety, upon a cursory view it appeared like the head of another.

Addison's Spectator.

The virtues of private persons *operate* but on a few; their sphere of action is narrow, and their influence is confined to it.

Atterbury.

In this understanding piece of clock-work, his body, as well as other senseless matter, has colour, warmth, and softness. But these qualities are not subsistent in those bodies, but are *operations* of fancy begotten in something else.

Bentley.

To administer this dose, there cannot be fewer than fifty thousand *operators*, allowing one *operator* to every thirty.

Swift.

A plain convincing reason *operates* on the mind both of a learned and ignorant hearer as long as they live.

Id.

This circumstance of the promise must give life to all the rest, and make them *operative* toward the producing of good life.

Decay of Piety.

Where causes *operate* freely, with a liberty of difference to this or the contrary, the effect will be contingent, and the certain knowledge of it belongs only to God.

Watts.

Although I have taught surgery seventeen years, and exhibited the most difficult *operations* upon the dead body, I have never ventured to apply a cutting instrument to a living subject, through a fear of giving too much pain.

Haller. Bibl. Chir. 1775.

No prudent mother will permit this eloquent village matron to quell the hearts of her children with terrors. We were once present when a group of speechless children sat listening to 'Blue-beard,' breathing astonishment. A gentleman, who saw the charm beginning to *operate*, resolved to counteract its dangerous influence.

Edgeworth.

These are all the essential circumstances which need here be mentioned, in regard to the mode of *operating*. The first day after the operation afforded hopes of a cure; and the circulation in the fore-arm was returning; but a difficulty of breathing afterwards came on, the limb mortified, and the patient died on the sixth day.

Dr. A. Rees.

OPHIDIUM, a genus of fishes belonging to the order of apodes. The principal characters are these:—The head is somewhat naked; the teeth are in the jaws, palate, and fauces; the body long; the fins of the back, tail, and anus, confounded in one; no fin on the under part of the body; and the eyes covered by the common skin. Of this genus there are several species, of which the most curious is the

O. barbatum of Linnæus, thus described by Dr. Broussonet in the seventy-first volume of the Philosophical Transactions:—'The scales of the ophidium,' says he, 'are irregularly placed and dispersed over the whole body. Their form is sometimes round, sometimes nearly oval. They are larger near the head, and in the lower part of the body; but are hardly to be distinguished near the tail. They adhere to the body

by means of a particular transparent skin, which is in general very thin, but somewhat thicker near the neck, and extended loosely over the whole head: this skin is very easily destroyed, after which, the scales falling, the body appears spotted. When you look at them with the naked eye, they appear as covered with very small grains; but, viewed through a microscope, the middle of them appears more elevated than the margin; and from the centre to the margin, close by each other, there are many lines or rays formed by small scales placed one upon another, like tiles upon a roof, the superior being always the nearer to the centre. This sort of scales, which may be called umbonate, are fastened to the body by very small vessels, which are inserted in their middle; they are to be seen on the body only, not on the head nor the fins.' The anatomy of this fish comprehends some very remarkable circumstances, which, our author thinks, were never observed in any other species. When the skin is drawn off there appears a thin membrane of a silver color, which covers the muscles. The muscles being removed, we find the peritonæum, which lines the abdominal cavity, and is adherent to the swimming bladder by some elongations. It is of a silver hue, with some very small black points. The ventricle is not to be distinguished from the intestines by any other mark but by its size; its form is oblong; it is extended almost to the anus, whence the intestinal duct has a retrograde course, and then descends again, having a little dilatation near the anus. On the vertebræ next the anus, on the outside of the peritonæum, is a kind of cavity of an oblong form, containing a reddish viscus, which he takes to be the kidney. The first vertebra from the head has nothing very remarkable in its structure. The second has on each side an elongated and sharp apophysis, to the apex of which is annexed a small ligament. The third is very flat, and has on each side a kind of triangular and sharp apophysis, to which adheres a ligament, as to the second. The fourth is remarkable in having a sharp apophysis on each side, articulated with the body of the vertebra; and under each of them is another articulated apophysis, flattish, thick, roundish at its extremities, and forked at its basis. The fifth, which is strongly adherent to the former, has in its middle a bifid process. The sixth has in its middle a flattish elevation, sharp on each side. Between the extremity of the larger apophysis of the fourth vertebra is a bone, or rather a hard cartilage, which bears the figure of a kidney, its convexity being turned towards the body of the vertebra: its position is parallel to the bodies of the vertebræ; its motion is half circular, one of its parts, viz. the lowest, being in the cavity of the swimming bladder, to which it adheres by a thin membrane, so that no air can escape at that part. It is covered by membranes, which adhere strongly to its middle; in this part are fastened the two ligaments of the apophysis of the second and third vertebræ, which are of a great tenuity. In the same point are fastened also two ligaments, each of which belongs to an oblong muscle parallel to each other, and fixed to the bones of the lowest and

posterior part of the head. All this apparatus is certainly subservient to the purpose of swimming; but it is very remarkable that, if these parts are necessary to some animal function, they should not be found in all the individuals; 'for I have seen,' says our author, 'two, of which the vertebræ were not different from the vertebræ of the other species; which difference depends, perhaps, on the difference of sex. I am inclined to believe so; but the generation in this fish seems to be no less mysterious than that of the eel: I could never distinguish a male from a female in this species.' This fish commonly grows to the size of eight or nine inches. It is found in all the Mediterranean Sea, and in great plenty in the Adriatic: its flesh is not of a good taste, rather coarse, as is that of all the species of fishes which, having no ventral fins, are obliged to make great efforts in swimming, and have consequently the muscles harder.

OPHIOLINGUA, adder's tongue, a genus of the natural order of filices, and the cryptogamia class of plants. The spike is articulated, flat, and turned to the two sides; with the articuli or joints opening across. There are seven species, of which the only remarkable one is the

O. vulgatum, the common adder's tongue, which is a native of several places of Britain, growing in meadows and moist pastures. The country people make an ointment of the fresh leaves, and use it as a vulnerary to green wounds; which is a very ancient application, recommended by Matthioli, Tragus, and others.

OPHIOMANCY, in antiquity, the art of making predictions from serpents. Thus Calchas, on seeing a serpent devour eight sparrows with their dam, foretold the duration of the siege of Troy: and the seven coils of a serpent that was seen on Anchises's tomb were interpreted to mean the seven years that Æneas wandered from place to place before he arrived at Latium.

OPHIOPHAGOUS, *adj.* Gr. *ὄφις* and *φάγω*. Serpent eating. Not used.

All snakes are not of such poisonous qualities as common opinion presumeth; as is confirmable from *ophiophagus* nations, and such as feed upon serpents. *Broun.*

OPHIORRHIZA, in botany, a genus of the monogynia order, and pentandria class of plants: natural order forty-seventh, stellatæ: cor. funnel-shaped: caps. twin, bilocular, and polyspermous. There are two species; the most remarkable is the

O. Asiaticum, or true *lignum colubrinum*. The root of this is known in the East Indies to be a specific against the poison of that most dreadful animal called the hooded serpent. There is a treatise in *Amœn. Acad. tom. iv.* upon this subject, wherein the author, John And. Darelius, undertakes, from the description of such authors as had seen it upon the spot, to ascertain the plant from which the genuine root is taken. It appears in this account that it had puzzled the European physicians; and what had been sold in the shops for it is the root of a very different plant, and of a poisonous nature. The true root is called *mungus*, for the following reason:—There is a kind of weasel in the East

Indies, called *mungutia* by the natives, *mungo* by the Portuguese, and *muncas* by the Dutch. This animal pursues the hooded serpent, as the cat does the mouse. As soon as the serpent appears, the weasel attacks him; and, if she chances to be bit by him, she immediately runs to find a certain vegetable, upon eating which she returns and renews the fight.—The Indians are of opinion that this plant is the *mungus*. That celebrated traveller Kämpfer, who kept one of these weasels tame, that eat with him, lived with him, and was his companion wherever he went, says he saw one of these battles between her and the serpent, but could not certainly find out what root the weasel looked for. But, whether the weasel first discovered this antidote or not, it is an infallible remedy against the bite of the hooded serpent.

OPHIOXYLON, in botany, a genus of the monœcia order, and polygamia class of plants: *HERMAPHRODITE* CAL. quinquefid: cor. quinquefid and funnel-shaped; with a cylindrical nectarium within its mouth.

OPHIR, a country mentioned in Scripture, from which Solomon had great quantities of gold brought home in ships, which he sent for that purpose; but respecting the situation of which authors are much divided in opinion. Some have gone to the West, others to the East Indies, and the eastern coasts of Africa, in search of it. But the two opinions which have been most plausibly supported are those of Mr. Bruce, the Abyssinian traveller, and Dr. Doig, author of *Letters on the Savage State*. The latter holds that Ophir was somewhere on the west coast of Africa; the former is satisfied that it was the country which is now called Sofala, a kingdom of Africa, on the coast of Mosambique, near Zanguebar.

OPHITES, *n. s.* A stone resembling a serpent.

Ophites has a dusky greenish ground, with spots of a lighter green, oblong, and usually near square. *Woodward.*

OPHITES, in church history, Christian heretics, so called both from the veneration they had for the serpent that tempted Eve, and the worship they paid to a real serpent: they pretended that the serpent was Jesus Christ, and that he taught men the knowledge of good and evil. They distinguished between Jesus and Christ: Jesus, they said, was born of the Virgin, but Christ came down from heaven to be united with him; Jesus was crucified, but Christ had left him to return to heaven. They distinguished the God of the Jews, whom they termed *Jaldabaoth*, from the supreme God: to the former they ascribed the body, to the latter the soul of men. They had a live serpent, which they kept in a kind of cage; at certain times they opened the cage-door, and called the serpent: the animal came out, and, mounting upon the table, twined itself about some loaves of bread; this bread they broke, and distributed it to the company, who all kissed the serpent: this they called their eucharist.

OPHIRYS, *twyblade*, a genus of the diandria order, and gynandria class of plants: natural order seventh, orchidæ. The nectarium is a

little carinated below. The species are numerous; but the most remarkable are the following:

1. *O. anthropophora*, man-shaped ophrys, or man-orchis, has a roundish bulbous root, crowned with three or four oblong leaves; upright thick stalks, rising a foot and a half high, adorned with narrow leaves, and terminated with loose spikes of greenish flowers, representing the figure of a naked man; the lip of the nectarium linear tripartite, with the middle segment longest and bifid. There is a variety with brownish flowers tinged with green.

2. *O. insectifera*, the insect orchis, bee-flower, or gnat-flower, has two roundish bulbous roots, crowned with oblong leaves; erect leafy stalks, from six to ten or twelve inches high, terminated by spikes of insect-shaped greenish flowers, having the lip of the nectarium almost five-lobed. This wonderful species exhibits flowers in different varieties, that represent singular figures of flies, bees, and other insects; and are of different colors in the varieties.

O. monorchis, or musky ophrys, has a roundish bulbous root: crowned with three or four oblong leaves; an erect naked stalk, six inches high; terminated by a loose spike of yellowish, musky scented flowers.

4. *O. nidus avis*, or bird's nest, with a bulbous, fibrated, clustered root; upright, thick, succulent stalks, a foot high, sheathed by the leaves, and terminated by loose spikes of pale-brown flowers; having the lip of the nectarium bifid.

5. *O. ovata*, oval-leaved ophrys, or common twy-blade, has a bulbous, fibrated root; crowned by two oval, broad, obtuse, veined, opposite leaves; an erect, succulent green stalk, six or eight inches high, naked above, and terminated by a loose spike of greenish flowers, having the lip of the nectarium bifid. The flowers of this species resemble the figure of a gnat.

6. *O. spiralis*, spiral orchis or triple ladies tresses, has bulbous, oblong, aggregated roots; crowned by a cluster of oval, pointed, ribbed leaves; erect simple stalks, half a foot high; terminated by long spikes of white odoriferous flowers hanging to one side, having the lip of the nectarium entire, and crenated. All these species of ophrys flower in summer, at different times, in different sorts, from May until July; and in most of the sorts exhibit a singularly curious appearance. The plants are perennial in their roots, which are of the bulbous fleshy kind, from which the flower stalks rise annually in spring, and decay in autumn; at which period is the proper time for removing the roots from one place to another. They all grow wild in Britain, &c.; are residents of woods, bogs, marshy grounds, sterile pastures, chalky soils, and the like places, where they flourish and display their singular flowers in great abundance, from which places they are introduced into gardens for variety; and having procured some plants at the proper season, and planted them in soils and situations somewhat similar to that in which they naturally grow, the roots will abide for several years, and flower annually. As to their propagation, it may be tried by seed in a shady border, as soon as it is ripe; likewise by

offsets from the root, though they multiply sparingly in gardens: however, roots of some standing may be examined at the proper season, and any offsets separated and planted in their proper places.

OPHTHALMIC, *adj.* } *Fr. ophthalmic; Gr. Op'HTHALMY, n. s.* } *οφθαλμος*. Relating to the eye: a disease of the eyes.

The use of cool applications externally is most easy to the eye; but, after all, there will sometimes ensue a troublesome *ophthalmia*. *Sharp's Surgery.*

The *ophthalmia*, I hope, has left you. Without doubt this complaint has been occasioned in yourself, from the too great use you have made of your eyes; but a similar one, which afflicted our troops in Egypt, proceeded, I think, from a too great glare of light. *Bp. Watson.*

OPIATE, *n. s. & adj.* From **OPIUM**, which see. A soporific; a medicine causing sleep: somniferous.

The particular ingredients of those magical ointments, are *opiate* and *soporiferous*. For anointing of the forehead and backbone is used for procuring dead sleeps. *Bacon.*

All their shape
Spangled with eyes, more numerous than those
Of Argus, and more wakeful than to drowse,
Charmed with Arcadian pipe, the pastoral reed
Of Hermes, or his *opiate* rod. *Milton.*

Lettuce, which has a milky juice with an anodyne or *opiate* quality resolvent of the bile, is proper for melancholy. *Arbutnot.*

They chose atheism as an *opiate*, to still those frightening apprehensions of hell, by inducing a dullness and lethargy of mind, rather than to make use of that native and salutary medicine, a hearty repentance. *Bentley.*

Thy thoughts and music change with every line;
No sameness of a prattling stream is thine,
Which with one unison of murmur flows,
Opiate of inattention and repose. *Harte.*

Should tempting novelty thy call refrain,
And Sloth effuse her *opiate* fumes in vain;
Should Beauty blush or fix her fatal dart,
Nor claim the triumph of a labored heart. *Johnson.*

OPIE (John), R. A., and professor of painting at the academy, was born in 1761 in the parish of St. Agnes, Cornwall. His father was a carpenter, and intended him for the same occupation, but his talents when he was very young attracted the notice of Dr. Walcot (the Peter Pindar of the last reign), a physician at Truro, who gave him some instructions, and enabled him to travel in the neighbourhood as a portrait painter. He returned from his first expedition with twenty guineas, earned by his pencil, and thenceforward resolved to devote himself to painting. At about nineteen years of age he removed to London, but it was not till 1786 that any of his pictures were admitted into Somerset House. He was shortly after nominated an associate of the academy, and an academician. He first exercised his literary ability in a life of Sir Joshua Reynolds, in Dr. Walcot's edition of Pilkington's painters. He then published *An Enquiry into the requisite Cultivation of the Arts of Design in England*; and delivered lectures at the Royal Institution. In 1804 he succeeded Mr. Fuseli as professor of painting. He died April 9th, 1807, and was interred in St. Paul's. His pencil

was employed on the pictures exhibited in the Boydell and Macklin galleries, and some of his lectures as professor of painting have been published.

OPIFICE, *n. s.* } Latin *opificium*, *opifer*.
OP'IFICER. } Workmanship: opificer, the workman or artificer.

There is an infinite distance betwixt the poor mortal artist and the almighty opificer. *Bentley.*

OPINE', *v. n.* } Latin *opinor*.
OPIN'ABLE, *adj.* } To think; judge;
OPIN'ATION, *n. s.* } suppose: opinable
OPINATOR, *n. s.* } means which may
OPIN'ATIVE, *adj.* } be thought: opina-
OPINIA'TOR, *n. s.* } tion, opinion; no-
OPINIA'TRE, *adj.* } tion; opinator, he
OPINIA'TRETT, or } who holds or con-
OPINIA'TRY, *n. s.* } ceives a notion: o-
OPIN'ION, *n. s. & v. a.* } pinative, imagined;
OPIN'IONATIVE, *adj.* } stiff in opinion: o-
OPINIONATE, *n. s.* } pinator, one who holds
OPIN'IONATELY, *adv.* } or is fond of par-
OPIN'IONATENESS, *n. s.* } ticular notions: o-
OPINIONIST. } piniate (Fr. *opini-*

tre), a needless Gallicism, for obstinate, stubborn in opinion: opiniatry or opiniatry (a word of the same character as the last), obstinacy; pertinacity of opinion: all the above words are of unusual occurrence, of little use, and less elegance. Opinion is, notion; persuasion of mind; sentiment; judgment: to opinion (an obsolete verb), means to opine; think; deem: opinionative, tenacious or stubborn in opinion; which sense the adverb and noun-substantive following take: opinionist, one who is opinionative; one stubborn or inflexible in his notions.

What will not *opiniators* and self-believing men dispute of and make doubt of? *Raleigh.*

Opinion is a light, vain, crude, and imperfect thing, settled in the imagination, but never arriving at the understanding, there to obtain the tincture of reason. *Ben Jonson.*

Howsoever I have no *opinion* of those things; yet so much I conceive to be true, that strong imagination hath more force upon things living, than things merely inanimate. *Bacon.*

In actions of arms small matters are of great moment, especially when they serve to raise an *opinion* of commanders. *Hayward.*

He is a rare man that is not wise in his own conceit; and that says not within himself, 'I see more than my neighbour;' for we all are born proud and self-opinionate. *Bp. Hall.*

Where no such settled custom hath made it law, there it hath force only according to the strength of reason and circumstances joined with it, or as it shews the *opinion* and judgment of them that made it; but not at all as if it had any commanding power of obedience. *Selden.*

Time wears out the fictions of *opinion*, and doth by degrees discover and unmask that fallacy of ungrounded persuasions; but confirms the dictates and sentiments of nature. *Wilkins.*

Essex left lord Roberts governor; a man of a sour and surly nature, a great *opiniator*, and one who must be overcome, before he would believe that he could be so. *Clarendon.*

Opinion is, when the assent of the understanding is so far gained by evidence of probability that it rather inclines to one persuasion than to another, yet not altogether without a mixture of uncertainty or doubting. *Hale.*

Consider against what kind of *opiniators* the reason above given is levelled. *Id.*

Fear is an ague, that forsakes
 And haunts by fits those whom it takes;
 And they'll *opine* they feel the pain
 And blows they felt to-day, again. *Hudibras.*

The Stoicks *opinioned* the souls of wise men dwell about the moon, and those of fools wandered about the earth; whereas the Epicureans held nothing after death. *Broune.*

Least popular *opiniatry* should arise, we will deliver the chief *opinions*. *Id. Vulgar Errors.*

It is difficult to find out truth, because it is in such inconsiderable proportions scattered in a mass of *opiniative* uncertainties; like the silver in Hiero's crown of gold. *Glanville.*

That the soul and angels are devoid of quantity and dimension, is generally *opinioned*. *Id.*

Every conceited *opinionist* sets up an infallible chair in his own brain. *Id. to Albius.*

We may allow this to be his *opinion* concerning heirs, that where there are divers children the eldest son has the right to be heir. *Locke.*

Instead of an able man you desire to have him an insignificant wrangler, *opiniatre* in discourse, and priding himself in contradicting others. *Id.*

The one sets the thoughts upon wit and false colours, and not upon truth; the other teaches fallacy, wrangling, and *opiniatry*. *Id. on Education.*

So much as we ourselves comprehend of truth and reason, so much we possess of real and true knowledge. The floating of other men's *opinions* in our brains, makes us not one jot the more knowing, though they happen to be true: what in them was science, is in us but *opiniatry*. *Locke.*

One would rather chuse a reader without art, than one ill instructed with learning, but *opinionative* and without judgment. *Burnet.*

In matters of mere speculation, it is not material to the welfare of government or themselves, whether they *opine* right or wrong, and whether they be philosophers or no. *South.*

Charity itself commands us, where we know no ill, to think well of all; but friendship, that always goes a pitch higher, gives a man a peculiar right and claim to the good *opinion* of his friend. *Id.*

A story out of Boccacini sufficiently shews us the *opinion* that judicious author entertained of the crickets. *Addison.*

Blest be the princes who have fought
 For pompous names, or wide dominion,
 Since by their error we are taught,
 That happiness is but *opinion*. *Prior.*

I can pass by *opiniatry*, and the busy meddling of those who thrust themselves into every thing. *Woodward's Letters.*

I was extremely concerned at this *opiniatry* in leaving me; but he shall not get rid so. *Pope.*

But I, who think more highly of our kind,
Opine, that nature, as in duty bound,
 Deep hid the shining mischief under ground. *Id.*

If a woman had no *opinion* of her own person and dress, she would never be angry at those who are of the *opinion* with herself. *Law.*

The only view in which the Scriptures ever regards belief of the truth is as the foundation of virtuous practice: without which effect, not right *opinions* only, but also all other qualifications whatsoever, are, in the religious estimation of things, reputed as nothing. *S. Clarke.*

Set your *opinion* at whatever pitch,
 Knots and impediments make something hitch;
 Adopt his own, 'tis equally in vain,
 Your thread of argument is snapped again;

The wrangler, rather than accord with you,
Will judge himself deceived and prove it too.

Cosper.

Here they are, the family of the Surfaces up to the Conquest.

SIR. O.—And in my *opinion* a goodly collection.

Sheridan.

We should never triumph over children for changing their *opinions*. You think it is a want of judgment that he changes his *opinion*. Do you think it a proof that your scales are bad, because they vibrate with every additional weight that is added to either side?

Edgeworth.

I protest that if the ministers whom I have mentioned, had pledged themselves yet deeper to a mistaken *opinion* of France, I should yet be willing to credit their asseveration, if they were now to come forward and tell us, that the declaration and confession of France herself had completely changed their *opinion*.

Canning.

OPINION is that judgment which the mind forms of any proposition for the truth or falsehood of which there is not sufficient evidence to produce science or absolute belief. That three angles of a plane triangle are equal to two right angles is not a matter of opinion, nor can it with propriety be called an object of the mathematician's belief: he does more than believe it; he knows it to be true. When two or three men, under no temptation to deceive, declare that they were witnesses of an uncommon though not preternatural event, their testimony is complete evidence, and produces absolute belief in the minds of those to whom it is given; but it does not produce science-like rigid demonstration. The fact is not doubted, but those who have it on report do not know it to be true, as they know the truth of propositions intuitively or demonstrably certain. When one or two men relate a story including many circumstances to a third person, and another comes who positively contradicts it, either in whole or in part, he, to whom those jarring testimonies are given, weighs all the circumstances in his own mind, balances the one against the other, and lends an assent, more or less wavering, to that side on which the evidence appears to preponderate. This assent is his opinion respecting the facts of which he has received such different accounts.

OPITIUS, or OPITS (Heury), a learned Lutheran divine, born at Altenburg in Misnia, in 1642. He was professor of theology and of the oriental languages at Kiel, where he acquired great reputation by a variety of excellent works concerning oriental literature and Hebrew antiquities. He died in 1712.

OPITS, or OPITIVS (Martin), a celebrated German poet, born at Breslaw in 1507. He acquired great fame by his Latin, and more by his German poems; and, retiring to Dantzic, wrote a history of the ancient Daci. He died of the plague in 1639.

OPIMUM, *n. s.* Arab. *ufyoon*; Gr. *οπιον*; Lat. *opium*, supposed from Gr. *οπος*, sap. The inspissated juice of the oriental poppy. See below.

Sleep hath forsook and given me o'er
To death's benumbing *opium* as my only cure.

Milton.

The color and taste of *opium* are, as well as its soporific or anodyne virtues, mere powers depending

on its primary qualities, whereby it is fitted to produce different operations on different parts of our bodies.

Loche.

OPIMUM, in the materia medica, is the inspissated juice of the papaver album brought to us in cakes from eight ounces to a pound weight. It easily receives an impression from the finger. It is to be chosen moderately firm, and not too soft; its smell and taste should be very strong, and care taken that there be no dirty or stony matter in it. In Asia, when the heads are near ripening, they wound them with an instrument that has five edges, which, on being stuck into the head, makes at once five long cuts in it; and from these wounds the opium flows, and is next day taken off by a person who goes round the field, and put up in a vessel which he carries fastened to his girdle; at the same time that his opium is collected the opposite side of the poppy-head is wounded, and the opium collected from it the next day. After they have collected the opium they moisten it with a small quantity of water or honey, and work it a long time upon a flat, hard, and smooth board, with a thick and strong instrument of the same wood, till it becomes of the consistence of pitch; and then work it up with their hands, and form it into cakes or rolls for sale. Opium, at present, is in great esteem, and is one of the most valuable of all the simple medicines. In its effects on the animal system it is the most extraordinary substance in nature. Its first effects are like those of a strong, stimulating cordial, but are soon succeeded by universal languor or irresistible propensity to sleep, attended with dreams of the most rapturous and enthusiastic kind. After these contrary effects are over, which are generally terminated by a profuse sweat, the body becomes cold and torpid; the mind pensive and desponding; the head is affected with stupor, and the stomach with sickness and nausea. Those who take opium to excess experience languor and dejection of spirits common to such as drink spirituous liquors in excess; to the bad effects of which it is similar, since, like those, they are not easily removed without a repetition of the dose. By the indiscriminate use of that preparation of opium called Godfrey's cordial, many children are yearly cut off; for it is frequently given dose after dose, without moderation, by ignorant women and mercenary nurses, to silence the cries of infants and lull them to sleep, by which they are at last rendered stupid, inactive, and rickety. Opium is used as a luxury in the east. Mr. Grose informs us, that most of the hard-laboring people at Surat, and especially the porters, take great quantities of this drug, which, they pretend, enables them to work, and carry heavier burdens than they otherwise could do. Some of these, our author assures us, will take more than an ounce at a time without detriment. Besides these effects of opium, it is said by the Indians to have a very singular one, in bringing on a seeming heaviness of the head and sleepiness of the eye, at the same time that it really produces great watchfulness. It is also considered as a great inspirer of courage, or rather insensibility to danger; so that the commanders make no

scruple of allowing large quantities of it to the soldiers, when they are going to battle or engaged in any hazardous enterprise. The best opium in the world is said to come from Patna on the Ganges, where, at least, the greatest traffic of it is made, and whence it is exported all over India; though in some parts, especially on the Malay coasts, it is prohibited under pain of death on account of the madness, and murders consequent upon that madness, which are occasioned by it; notwithstanding which severe prohibition, however, it is plentifully smuggled into all these countries. The soil about the Ganges is accounted best for producing the strongest kind of opium. Opium, if long kept upon the skin, takes off the hair, and always occasions an itching in it; sometimes it exulcerates it, and raises little blisters, if applied to a tender part. Sometimes, on external application, it allays pain, and even occasions sleep; but it must by no means be applied to the head, especially to the sutures of the skull; for it has been known to have the most terrible effects in this application, and even to bring on death itself. It appears, too, from some curious experiments made by Dr. Leith, to act as the most powerful of all styptics. Opium contains gum resin, essential oil, salt, and earthy matter; but its narcotic or somniferous power has been experimentally found to reside in its essential oil. Agreeably to the descriptions given of the powers of opium by most medical authors, we have used the term narcotic; but Dr. Beddoes objects to it in the following words:—'It is curious to see what pains medical writers have taken to imagine hypotheses, either out of mere complaisance to the term narcotic, or because opium is a drug in Christendom, and wine an article of diet, rather than suffer themselves to see that opium makes a man merry or drunk, then lays him asleep, then afterwards causes him to awake with a head-ache, in the same manner as wine.'

In 1799 the manufacture of opium in India was placed under the management of the government then under marquis Wellesley. All the abuses that had prevailed in the preparation of the drug, adulteration, fallacious envelopes of the cakes, short weight, &c., were at that period abolished, and, ever since, the utmost care has been taken, that the opium put up at the company's sales shall be in the utmost state of purity, that the envelopes shall be of the due degree of thickness, and the drug of the proper consistence. Dr. John Fleming, M.P., then president of the Medical Board at Calcutta, had the merit of having formed and recommended this plan of providing the opium, and, on his return to England in 1803, he received on this account a remuneration from the Honorable Court of Directors, of Sicca rupees 50,000, or £6250 sterling. According to Orfila, a dangerous dose of opium is rather aggravated than counteracted by vinegar. The proper remedy is a powerful emetic, such as sulphate of zinc, or sulphate of copper. See an interesting and well-treated case, in the first volume of the *Medico-Chirurgical Transactions*, by Dr. Marcet and Mr. Astley Cooper. The experiments of M. Magendie have shown that the salt extracted long ago from

opium by Derosnes, and which has been called narcotine, produces a stupor differing from real sleep and acts on dogs as a poison in small doses. This narcotine may be separated by sulphuric ether, from the strained watery extract of opium. The ether afterwards deposits the narcotine in crystals; while the residuary opium is supposed to be better fitted than before, for procuring tranquil sleep.

The monopoly of the opium, produced from the culture of the poppy, is the third principal branch of the East India Company's territorial revenue in India.

In 1773 the contract or extensive privilege for providing opium was granted to Meer Munkeer, in preference (as was stated by government) to any one else, because, being the person employed by the gentlemen of Patna in that business, he was the best acquainted with the proper mode of managing it, and would account for any outstanding balances. He was to deliver the Bahar opium at 320 rupees, and the Oude at 350 rupees per maund.

Since that time the East India Company's annual revenue upon that article alone, has risen from eight to upwards of eighty lacs of rupees, or more than £1,000,000 sterling. By a report, dated East India House, 29th February 1816, which was at that time laid before Parliament, the sale of opium in Bengal for the year 1813-14, amounted to ninety-six lacs, 40,729 current rupees, the advances and charges upon which, only amounted to ten lacs, 77,638 current rupees.

But the opium used in Britain is principally supplied from Turkey. The gross amount of duty upon opium, imported into Great Britain in the year 1816, was only £2,651 13s., while the average quantity consumed in Britain is 14,400 lbs., which is chargeable with a duty of 8s. 8d. per pound. There are besides from 250 to 300 chests of opium imported from Turkey, and lodged in bond warehouses for exportation, each chest containing from 150 lbs. to 200 lbs. of opium. This statement was made by a member of the Turkey Company in London.

The following account of the Indian method of cultivating opium, as practised in the province of Baha, is given by Mr. Kerr:—'The field,' he says, 'being well prepared by the plough and harrow, and reduced to an exact level superficies, it is then divided into quadrangular areas of seven feet long, and five feet in breadth, leaving two feet of interval, which is raised five or six inches, and excavated into an aqueduct for conveying water to every area, for which purpose they have a well in every cultivated field. The seeds are sown in October or November. The plants are allowed to grow six or eight inches distant from each other, and are plentifully supplied with water. When the young plants are six or eight inches high, they are watered more sparingly. But the cultivator strews all over the areas a nutrient compost of ashes, human excrements, cow-dung, and a large portion of nitrous earth, scraped from the highways and old mud walls. When the plants are nigh flowering, they are watered profusely, to increase the juice. When the capsules are half grown, no more wa-

ter is given, and they begin to collect the opium. At sun-set they make two longitudinal double incisions upon each half-ripe capsule, passing from below upwards, and taking care not to penetrate the internal cavity of the capsule. The incisions are repeated every evening until each capsule has received six or eight wounds; they are then allowed to ripen their seeds. The ripe capsules afford little or no juice. If the wound was made in the heat of the day, a cicatrix would be too soon formed. The night dews, by their moisture, favor the extillation of the juice. Early in the morning, old women, boys, and girls, collect the juice by scraping it off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by the hand in the open sunshine, until it becomes of a considerable spissitude. It is then formed into cakes of a globular shape, and about four pounds in weight, and laid into little earthen basins, to be further exsiccated. These cakes are covered over with the poppy or tobacco leaves, and dried until they are fit for sale. There are about 600,000 lbs. of it annually exported from the Ganges.

It appears highly probable that the white poppy might be cultivated for the purpose of obtaining opium to great advantage in Britain. 'The milky juice, drawn by incision from poppy-heads, and thickened either in the sun or shade, even in this country, has all the characters of good opium; its color, consistence, taste, smell, faculties, phenomena, are all the same; only, if carefully collected, it is more pure and more free of feculencies.' Indeed the cultivation of it has been in several instances attempted with success.

Opium, called also Opium Thebaicum, from being anciently prepared chiefly at Thebes, has been a celebrated medicine from the remotest times. It differs from the meconium, which by the ancients was made of the expressed juice or decoction of the poppies. It has a reddish brown color, and a strong peculiar smell; its taste at first is nauseous and bitter, but soon becomes acrid, and produces a slight warmth in the mouth; a watery tincture of it forms an ink, with a chalybeate solution. The use of this celebrated medicine, though not known to Hippocrates, can be clearly traced back to Diagoras, who was nearly his contemporary, and its importance has ever since been gradually advanced by succeeding physicians of different nations. Its extensive practical utility, however, has not been long well understood; and in this country, perhaps, may be dated from the time of Sydenham. Opium is the chief narcotic now employed; it acts directly upon the nervous power, diminishing the sensibility, irritability, and mobility of the system. From this sedative power of opium, by which it allays pain, inordinate action, and restlessness, it naturally follows, that it may be employed with advantage in a great variety of diseases. Indeed, there is scarcely any disorder in which, under some circumstances, its use is not found proper; and, though in many cases it fails of producing sleep, yet if taken in a full dose, it occasions a pleasant tranquillity of mind, and a drowsiness which approaches to

sleep, and refreshes the patient. The requisite dose of opium varies in different persons, and in different states of the same person. A quarter of a grain will in one adult produce effects which ten times the quantity will not do in another; and a dose that might prove fatal in cholera or cholic, would not be perceptible in many cases of tetanus or mania. The lowest fatal dose, to those unaccustomed to take it, seems to be about four grains; but a dangerous dose is so apt to produce vomiting, that it has seldom time to occasion death. When given in too small a dose, it often produces disturbed sleep, and other disagreeable consequences; and in some cases it seems impossible to be made to agree in any dose or form. Often, on the other hand, from a small dose, sound sleep and alleviation of pain will be produced, while a larger one occasions vertigo and delirium. Some prefer the repetition of small doses; others the giving a full dose at once; its operation is supposed to last about eight hours.

OPOBALSAM. The most precious of the balsams is that commonly called balm of Gilead, opobalsamum, balsamæleon, balsamum verum album, Ægyptiacum, Judaicum, Syriacum, & Mecca, &c. This is the produce of the amyris opobalsamum.

The true balsam is of a pale yellowish color, clear and transparent, about the consistence of Venice turpentine, of a strong, penetrating, agreeable, aromatic smell, and a slightly bitterish pungent taste. By age it becomes yellower, browner, and thicker, losing by degrees, like volatile oils, some of its finer and more subtle parts. To spread, when dropped into water, all over the surface, and to form a fine thin rainbow-colored cuticle, so tenacious that it may be taken up entire by the point of a needle, were formerly infallible criteria of the genuine opobalsam. Neumann, however, had observed that other balsams, when of a certain degree of consistence, exhibit these phenomena equally with the Egyptian. According to Bruce, if dropped on a woollen cloth, in its pure and fresh state, it may be washed out completely and readily with simple water.

OPOCALPASUM, OPOCARBASUM, or APOCALPASUM, a gummy resinous substance, which has a strong resemblance to the best liquid myrrh, and which in the time of Galen they mixed with myrrh. It was difficult, according to this writer, to distinguish the one from the other unless by their effects. It was a poisonous juice, which frequently produced lethargy and sudden strangling. He has known several persons who died in consequence of inadvertently taking myrrh in which there was a mixture of opocarbassum. Perhaps it was only a juice composed of a solution of euphorbia, in which drops of opium were macerated. Poisons of this kind have from time immemorial been as common in Africa as that of arrows poisoned with the juice of the mancanilla is in America.

OPODELDOC, a quack medicine, compounded of camphor, soap and spirits, similar to the medical prescription called by regular practitioners the saponaceous balsam; only the opodeldoc has a larger proportion of soap. It is

prescribed for rheumatisms, chilblains, and all kinds of sprains.

OPOPONAX is the name of a medicinal gum of a tolerably firm texture, sometimes in masses formed of a number of small granules connected by a quantity of matter of the same kind; but these are usually loaded with extraneous matter, and are greatly inferior to the pure loose kind. The drops or granules of the fine opoponax are on the outside of a brownish-red color, and of a dusky yellowish or whitish color within: they are of a somewhat unctuous appearance, smooth on the surface: and are to be chosen in clear pieces, of a strong smell and acid taste. This gummy substance is obtained from the roots of an umbelliferous plant, which grows spontaneously in warm countries, and bears the cold of this. The juice is brought from Turkey and the East Indies; and it is an attenuating and aperient medicine. Boerhaave frequently employed it, along with ammoniacum and galbanum, in hypochondriacal disorders, obstructions of the abdominal viscera, and suppressions of the menstrual evacuations, from a sluggishness of mucous humors; with these intentions it is a useful ingredient in the pilulæ gummosæ and compound powder of myrrh of the London Pharmacopœia, but it is not employed in any composition of the Edinburgh. It may be given by itself in the dose of a scruple, or half a drachm: a whole drachm proves in many constitutions gently purgative: also dispels flatulencies, is good in asthmas, in inveterate coughs, and in disorders of the head and nerves.

OPORINUS (John), a celebrated German printer born at Basil, in 1507. His father was a painter, and being a man of education taught him Latin himself, in which he improved himself further when he studied Greek at Strasburg. He afterwards kept a school, transcribed MSS., and became a corrector of the press. He married an old woman, the widow of one Xelotect, a canon of Lucerne, who, though rich, was a perfect Xantippe, and, when relieved by her death, he was as poor as ever. He married, however, three times afterwards. He studied physic, and was for two years secretary to the famous Paracelsus. He at last commenced printer; and published many valuable works, from old MSS., with notes; as well as some original pieces of his own. He died in 1568, aged sixty-one.

OPORTO, or the Port, a large city, the second place of commercial consequence in Portugal, stands near the mouth of the Douro on its north bank, and covers an acclivity rising from the brink of the river. It is the grand outlet for all the products of the northern part of the kingdom, and particularly of the wine so well known by its name, and of which from 50,000 to 70,000 pipes are annually shipped. It has an old wall, five or six feet thick, flanked at intervals with towers, and is further protected by a small fort: but, as the harbour is extremely difficult of entrance, the Portuguese government have given little attention of late to the fortifications. The quay extends the whole length of the town; on one side

is a street, the other side is walled and raised for the purpose of fastening ships' cables. At certain seasons, in consequence of the rains, or of the melting of the snow on the mountains, the Douro is swelled here to a great size, and becomes a mighty torrent, when a number of booms are placed on the quay to secure the vessels. The roadstead of Oporto is very spacious.

The streets on the declivity of the hill are narrow, crooked, and dirty, but several of those on the top are fine and broad. Indeed Oporto is allowed on the whole to be the cleanest and most agreeable town in Portugal. The steepness of the hill, however, renders walking or riding difficult: on the east of the town the houses overhanging the side of the river are built on so steep a declivity, as to be accessible only by steps cut out of the rock.

The climate here is moist in winter, both from the vicinity of the Atlantic, and the mountains and woods of the neighbourhood. The cold is therefore keen for the latitude, but seldom reaches to frost: in summer, on the other hand, the heat would be intense, were it not moderated by the winds which blow regularly from the east in the morning, from the south in the middle of the day, and at night from the west. The gardens in the environs of the town are beautiful and pleasant, producing, according to their respective degrees of elevation, the fruits of the northern or southern latitudes: and the whole appearance of the place to a stranger is very imposing.

On the opposite bank of the Douro westward is Gaya, reputed to occupy the site of the ancient town of Cale, and considered now as a suburb of Oporto, which was once called Portus Cale. In process of time it became the more considerable town of the two, and took the title of O Porto (the Port), and the kingdom took that of Portus Cale (Portugal). To the east of Gaya is another small but populous town, called Villa Nova do Porto, inhabited by mechanics and the lower orders. Altogether the population of the two towns on the south bank is not short of 20,000. Between Gaya and Villa Nova are immense warehouses for storing the wine from the interior. The vicinity exhibits many traces of metallic ores, and particularly veins of copper.

The wine exported is produced, not strictly in the adjacent country, so much as in the extensive province of Tras los Montes, to the north-west, and in some districts of Entre Douro e Minho. The amount exported differs in different years. A chartered company for the regulation of this trade was established by the government in 1756. The lesser exports are linen, oil, sumach, and oranges. The imports are woollen, cotton, and hardware manufactures, all chiefly from England; fish from the west of England and Newfoundland; hemp and flax from the Baltic; and rice from the United States. Oporto has long been the seat of a British factory. The established commercial houses of the British are in number about thirty; but in addition there is always a number of English in Oporto as temporary visitors. They have an exchange or place of daily meeting in a part of the High Street covered with canvas. They have also a casino, or house fitted up with reading rooms. The ex-

change with this country is computed as at Lisbon, in milrees, of which about sixty-five (more or less according to circumstances) are reckoned to £1 sterling.

Opporto, in addition to its commercial establishments, contains a naval arsenal and dock yard, but the harbour, partly from rocks at the mouth of the Douro, and partly from the accumulation of sand, is seldom entered by ships of war. It is a bishop's see, the seat of a corregidor, a provedor, a military commander, and a theatre. The population of the whole, including the suburbs to the south, is about 70,000.

This city was in the possession of the French in 1808, and the spring of 1809, when marshal Soult was surprised here by lord Wellington. It remained ever after undisturbed by the French. It is 172 miles north by east of Lisbon, and forty-nine north of Coimbra.

OPOSSUM, in zoology. See DIDELPHIS.

OPPIA LEX, the Oppian law, in Roman antiquity, a law introduced by C. Oppius, the tribune, A. U. C. 540. It enacted, that no woman should wear above half an ounce of gold, have partly colored garments, or be carried in any city or town, or to any place within a mile, unless to celebrate some sacred festival. It was made while Hannibal was in Italy, and Rome was in great distress, but created much discontent. The Roman ladies, eighteen years after, petitioned for its repeal. Cato opposed the repeal, and satirised the ladies for appearing in public to solicit votes. The tribune Valerius answered the sage's objections, and carried the repeal with the unanimous consent of all the Comitia, Cato alone excepted. Liv. xxxiii.

OPPIANUS, a poet and grammarian of Anazarba in Cilicia in the second century. He composed a poem on Hunting, and another on Fishing, for which Antoninus Caracalla gave him as many golden crowns as there were verses in his poems; they were hence called Oppian's golden verses. He died in the thirtieth year of his age.

OPPELN, a considerable government of Prussian Silesia, containing the principality of Oppeln, Neiss, and Ratibor, together with the Prussian part of Jagerndorf and Troppau, or an area of 5000 square miles, divided into the circles of

| | |
|-------------------|-------------|
| Neisse, | Beuthen, |
| Grotkau, | Plesse, |
| Oppeln, | Falkenberg, |
| Rosenberg, | Ratibor, |
| Strehlitz (Great) | Tost, |
| Lublinitz, | Neustadt, |
| Kosel, | Rybnik, |
| Leobschutz. | |

The entire population amounts to about 450,000, chiefly Catholic. The province is altogether hilly, and often called High or Upper Silesia. It abounds in forests and valuable minerals. In the mountains the old Sclavonic dialect is spoken. The Oder is the chief river, and, though only partially navigable, greatly facilitates the transport of timber, and the other produce of the district. The numerous lakes abound in fish.

The principality of Oppeln, more than a third covered with forests, occupies more than the half of this government. It lies to the south of Breslau and Oels, and is still more backward than the rest, being inhabited almost exclusively by an illiterate race, of Vandal descent. It was governed by its own dukes of the race of Piast, till 1532, when, the family becoming extinct, it fell to Bohemia, and was acquired by Prussia, with the rest of Silesia, in 1742.

OPPELN, the capital of the above principality and government, situated on the Oder, has several churches, a collegiate foundation, a seminary for priests, two monasteries, and an hospital; also some linen manufactures and tanneries. Inhabitants 3200. It is fifty miles south-east of Breslau, and eighty-five north-east of Olmutz.

OPPENAU, a thriving town of Baden. The article of cherry brandy is here a principal object of export; also pitch, turpentine, and tar, prepared in the neighbouring mountains of the Black Forest. Population 1700. Fifteen miles east of Strasburg.

OPPENHEIM, a town of Hesse-Darmstadt, to the west of the Rhine. Population 1700. Here general Sacken's corps of the Prussian army crossed the Rhine on the 1st of January, 1814, in the invasion of France, and the troops took, in the presence of their king, a redoubt, with 700 prisoners and six cannon. Ten miles south by east of Mentz.

OPPENHEIM, a post-town of Montgomery county, New York, on the north bank of the Mohawk River, fifteen miles west of Johnstone; and fifty-six W. N. W. of Albany.

OPPIDO, a large town of Naples, in Calabria Ultra, situated among the mountains which form the south-west extremity of the Appennines. It is the see of a bishop, but was much injured by the earthquake of 1783. Population 8000. Twenty miles north-east of Reggio, and twenty E. N. E. of Messina, in Sicily.

OPIGNERATE, *v. a.* Lat. *opignero*. To pledge; pawn. Obsolete.

The duke of Guise Henry was the greatest usurer in France, for that he had turned all his estate into obligations; meaning that he had sold and *opignero*-rated all his patrimony, to give large donatives to other men. Bacon.

OPPILATE, *v. a.* Lat. *oppilo*. To heap
 OPPIA'TION, *n. s.* } up obstructively: the
 OPPIA'TIVE. } obstruction caused: obstructive.

The ingredients prescribed in their substance accutate the spirits, reclude *oppositions*, and mundify the blood. Harvey.

OPPO'NENT, *adj.* & *n. a.* Latin *opponens*. Antagonist; adverse: one who opposes or takes the opposite side of the dispute or argument.

Inasmuch as ye go about to destroy a thing which is in force, and to draw in that which hath not as yet been received, to impose on us that which we think not ourselves bound unto; that therefore ye are not to claim in any conference other than the plaintiff's or *opponent's* part. Hooker.

How becomingly does Philopolis exercise his office, and seasonably commit the *opponent* with the respondent, like a long practised moderator. Mera.

Be the foundations of this earth were laid,
It was *opponent* to our search ordained,
That joy still sought, should never be attained.

Prior.

We should never argue, or suffer others to argue for victory with our pupils: we should not praise them for cleverness in finding out arguments in support of their own opinion: we should praise their candour and good sense, when they perceive and acknowledge the force of their *opponent's* argument.

Edgeworth.

Joking on the poverty of his *opponent*, he remarks that if his learning would get him a good living he would say something.

Canning.

OPPORTUNE, *adj.* } *Fr. opportune*; *Lat. opportunely*, *adv.* } *opportunus*. Season-
OPPORTUNITY, *n. s.* } *able*; well-timed or
circumstanced; convenient: the adverb following these senses: opportunity is, fit time or place; convenience; propitious; concurrence of circumstances.

He was resolved to choose a war rather than have Bretagne carried by France, being situate so *opportunist* to annoy England either for coast or trade.

Bacon's Henry VII.

There was nothing to be added to this great king's felicity, being at the top of all worldly bliss, and the perpetual constancy of his prosperous successes, but an *opportune* death to withdraw him from any future blow of fortune.

Bacon.

A wise man will make more *opportunities* than he finds. Men's behaviour should be like their apparel, not too straight, but free for exercise.

Id.

Opportunity like a sudden gust,
Hath swelled my calmer thoughts into a tempest.
Accursed opportunity!
That workest our thoughts into desires, desires
To resolutions; these being ripe and quickened,
Thou givest them birth, and bringest them forth to action.

Denham.

Will lift us up in spite of fate,
Nearer our ancient seat; perhaps in view
Of those bright confines, whence, with neighbouring arms

And *opportune* excursion, we may chance
Re-enter heaven.

Milton's Paradise Lost.

The experiment does *opportunist* supply the deficiency.

Boyle.

I had an *opportunity* to see the cloud descend, and, after it was past, to ascend again so high as to get over part of the mountain.

Brown's Travels.

Neglect no *opportunity* of doing good, nor check thy desire of doing it, by a vain fear of what may happen.

Atterbury.

All poets have taken an *opportunity* to give long descriptions of the night.

Brome.

Had it not been for me I am persuaded Dr. Johnson never would have undertaken such a journey, and I must be allowed to assume some merit from having been the cause that our language has been enriched with such a book, &c., as I had such *opportunities* of knowing from what very meagre materials it was composed.

Boswell's Tour.

He who first saw his fellow creature suffer, could not fail to participate in the pain, and endeavour to find out the means of affording relief. *Opportunities* of exercising this useful inclination were never wanting.

Dr. A. Rees.

To protect the peaceable in their ordinary occupations is as much the province of the laws as to provide *opportunities* of discussion, for every purpose to which it is necessarily and practically applicable.

Canning.

OPPOSE, *v. a. & v. n.*
OPPOSELESS, *adj.*
OPPOSER, *n. s.*
OPPOSITE, *adj. & n. s.*
OPPOSITELY, *adv.*
OPPOSITENESS, *n. s.*
OPPOSITION.

Fr. opposer; *Latin oppono, oppositus*. To resist; hinder; act against; put in opposition; place over against, or in front: as a neuter verb, to

act adversely; object: opposeless is, not to be opposed; irresistible: opposer, an antagonist; rival; enemy: opposite, contrary; adverse; placed in front or over against: as a noun substantive, an adversary; opponent: oppositely, corresponds with the senses of opposite as an adjective: opposition is, situation fronting something opposed; resistance; hostility; contrariety of interest, meaning, or measures; inconsistency: and, in a political sense, the party generally opposing those in power, and 'never really,' according to Mr. Wilberforce, 'wishing mischief to the country; but only so much mischief as might drive their opponents out, and place themselves in their room.'

To the best and wisest, while they live, the world is continually a froward *opposite*, a curious observer of their defects and imperfections; their virtues it afterwards as much admireth.

Hooker.

The parts of every true *opposition* do always both concern the same subject, and have reference to the same thing, sith otherwise they are but in shew *opposite*, not in truth.

Id.

There's no bottom, none
In my voluptuousness: and my desire
All continent impediments would o'erbear,
That did *oppose* my will. *Shakespeare. Macbeth.*

Her grace sat down
In a rich chair of state; *opposing* freely
The beauty of her person to the people.

Shakespeare.

Now the fair goddess fortune
Fall deep in love with thee, and her great charms
Misguide thy *opposers'* swords: bold gentleman!
Prosperity be thy page.

Id. Coriolanus.

I could bear it longer, and not fail
To quarrel with your great *opposeless* wills.

Shakespeare.

He is the most skilful, bloody, and fatal *opposite* that you could have found in Illyria.

Id.

He
Cried Oh! and mounted; found no *opposition*
From what he looked for should *oppose*.

Id.

He practised to dispatch such of the nobility as were like to *oppose* against his mischievous drift, and in such sort to encumber and weaken the rest that they should be no impediments to him.

Hayward.

To the' other five;
Their planetary motions and aspects,
In sextile, square, trine and *opposite*,
Of noxious efficacy. *Milton's Paradise Lost.*

Virtue which breaks thro' *opposition*,
And all temptation can remove,
Most shines, and most is acceptable above.

Milton.

Brave wits that have made essays worthy of immortality; yet, by reason of envious and more popular *opposers*, have submitted to fate, and are almost lost in oblivion.

Glanville.

When the church is taken for the persons making profession of the Christian faith, the *catholic* is often added in *opposition* to hereticks and schismatics.

Pearson.

In this fallen state of man religion begins with repentance and conversion, the two *opposite* terms of which are God and sin. *Tillotson.*

They who never tried the experiment of a holy life, measure the laws of God not by their intrinsecal goodness, but by the reluctance and *opposition* which they find in their own hearts. *Id.*

I thro' the seas pursued their exiled race,
Engaged the heavens, *opposed* the stormy main ;
But billows roared and tempests raged in vain. *Dryden.*

The knight whom fate or happy chance
Shall grace his arms so far in equal fight,
From out the bars to force his *opposite*,
The prize of valour and of love shall gain. *Id.*
Nothing of a foreign nature, like the trifling novels by which the reader is misled into another sort of pleasure, *opposite* to that which is designed in an epick poem. *Id.*

He considers Lausus, rescuing his father at the hazard of his own life, as an image of himself when he took Anchises on his shoulders, and bore him safe through the rage of the fire and the *opposition* of his enemies. *Id. Dufrenoy.*

The lesser pair are joined edge to edge, but not *oppositely* with their points downward, but upward. *Grew.*

If all men are not naturally equal, I am sure all slaves are, and then I may, without presumption, *oppose* my single opinion to his. *Locke.*

Particles of speech have divers, and sometimes almost *opposite* significations. *Id.*

Reason can never permit the mind to reject a greater evidence to embrace what is less evident, nor allow it to entertain probability in *opposition* to knowledge and certainty. *Id.*

The use of language and custom of speech, in all authors I have met with, has gone upon this rule or maxim, that exclusive terms are always to be understood in *opposition* only to what they are opposed to, and not in *opposition* to what they are not opposed to. *Waterland.*

A hardy modern chief,

A bold *opposer* of divine belief. *Blackmore.*

This is a prospect very uneasy to the lusts and passions, and *opposite* to the strongest desires of flesh and blood. *Rogers.*

I do not see how the ministers could have continued in their stations, if their *opposers* had agreed about the methods by which they should be ruined. *Swift.*

The subject of difference in political principles was introduced. *Johnson.*—It is much increased by *opposition*. There was a violent Whig with whom I used to contend with great eagerness. After his death I felt my Toryism much abated. *Bonnel's Tour.*

The emphatic speaker dearly loves to *oppose*,
In contact inconvenient, nose to nose,
As if the gnomon on his neighbour's phiz,
Touched with a magnet had attracted his. *Corpor.*

Children, piqued instead of being convinced, hunt only for arguments in their own favour, and are mortified when a good reason is brought on the *opposite* side of the question. *Edgeworth.*

If an administration should succeed him, under which wisdom and prudence produced their usual effects of security and quiet, the right honourable gentleman would be at the head of the most violent and clamorous *opposition* that that country ever witnessed. *Sheridan.*

OPPOSITION, in British politics, is collectively used for the minority in parliament, or that body

of members in both houses who oppose the measures of ministry.

OPPRESS', *v. a.* } Latin *oppressus*. To
OPPRESSION, *n. s.* } crush by severity; over-
OPPRESSIVE, *adj.* } power; subdue: oppres-
OPPRESSOR, *n. s.* } sion is, the art or habit of
such severity or cruelty; or the state of suffering it; hence misery; hardship of any kind; and the dulness of spirit it produces; the adjective and second noun substantive corresponding.

If thou seest the *oppressions* of the poor marvel not at the matter, for he that is higher than the highest regardeth. *Ecclies.*

Israel and Judah were *oppressed* together, and all that took them captives held them fast; they refused to let them go. *Jeremiah.*

I from *oppressors* did the poor defend,
The fatherless, and such as had no friend. *Sandys.*

We're not ourselves,
When nature, being *opprest*, commands the mind
To suffer with the body. *Shakespeare. King Lear.*
Famine is in thy cheeks;
Need and *oppression* stare within thine eyes,
Contempt and beggary hang upon thy back. *Shakespeare.*

Cesar himself has work, and our *oppression*
Exceeds what we expected. *Id. Antony and Cleopatra.*

The cries of orphans, and the *oppressor's* rage,
Had reached the stars. *Dryden.*

Alicia, reach thy friendly arm,
And help me to support thy feeble frame,
That nodding totters with *oppressive* woe,
And sinks beneath its load. *Rowe's Jane Shore.*

We are all subject to the same accidents; and, when we see any under any particular *oppression*, we should look upon it as the common lot of human nature. *Addison.*

Drowsiness, *oppression*, heaviness, and lassitude, are signs of a too plentiful meal. *Arbutnot.*

To ease the soul of one *oppressive* weight,
This quits an empire, that embroils a state. *Pope.*

Alas! a mortal most *opprest* of those
Whom fate has loaded with a weight of woes. *Id.*

Come! by whatever sacred name disguised,
Oppression, come! and in thy works rejoice!
See nature's richest plains to putrid fens
Turned by thy fury. From their cheerful bounds,
See razed the enlivening village, farm and seat. *Thomson.*

In blazing height of noon,
The sun *oppressed*, is plunged in thickest gloom. *Id.*

Power when employed to relieve the *oppressed*, and to punish the *oppressor*, becomes a great blessing. *Swift.*

Has heaven reserved, in pity to the poor,
No pathless waste or undiscovered shore;
No secret inland in the boundless main,
No peaceful desert yet unclaimed by Spain.
Quick let us rise, the happy seats explore,
And bear *oppression's* insolence no more. *Johnson.*

Where individuals are *oppressed*, they combine against their *oppressor*, and oppose cunning and falsehood to power and force: they think themselves released from the connect of truth with their masters, &c. *Edgeworth.*

his head was drooping on his breast,
Fevered, throbbing, and *oppress*;
And o'er his brow so downward bent,
Oft his beating fingers went. *Byron.*

OPPRO'BRIOUS, *adj.* } Lat. *opprobrium*.
OPPRO'BRIOUSLY, *adv.* } Reproachful; dis-
OPPRO'BRIOUSNESS, *n. s.* } graceful; slanderous; scurrilous; blasted with slander or reproach: the adverb and noun substantive corresponding.

Himself pronounceth them blessed, that should
for his name sake be subject to all kinds of ignominy
and *opprobrious* malediction. *Hooker.*

Think you, this little prating York
Was not incensed by his subtle mother,
To taunt and scorn you thus *opprobriously*?
Shakespeare.

I will not here defile
My unstained verse with his *opprobrious* name.
Daniel.

Solomon he led by fraud to build
His temple right against the temple of God,
On the *opprobrious* hill. *Milton.*
They see themselves unjustly aspersed, and vindicate
themselves in terms no less *opprobrious* than
those by which they are attacked. *Addison.*

OPPUGN', *v. a.* } Lat. *oppugno*. To op-
OPPUGNANCY, *n. s.* } pose; resist; attack: op-
OPPUGNER. } position: he who op-
pugns or opposes.

For the ecclesiastical laws of this land we are led
by a great reason to observe, and ye be by no neces-
sity bound to *oppugn* them. *Hooker.*

Take but degree away, untune that string,
And hark what discord follows, each thing meets
In mere *oppugnancy*.

Shakespeare. Troilus and Cressida.

The ingredients reclude oppilations, mundify the
blood, and *oppugn* putrefaction. *Harvey.*

They said the manner of their impeachment they
could not but conceive did *oppugn* the rights of par-
liament. *Clarendon.*

If nothing can *oppugn* his love,
And virtue envious ways can prove,
What cannot he confide to do
That brings both love and virtue too?
Hudibras.

The moderate and degenerate Jews be, upon the
score of being the great patrons of man's free will,
not causelessly esteemed the great *oppugn*ers of God's
free grace. *Boyle.*

Neither the secret envy of those who repine at
these encouragements which God's providence hath
conferred on priests, nor the open malice of those
that furiously *oppugn* their welfare, shall ever over-
whelm them. *Barrow.*

Ramus was one of the first *oppugn*ers of the old
philosophy, who disturbed with innovations the quiet
of the schools. *Johnson.*

OPS, in mythology, the daughter of Cœlus
and Terra, the sister and wife of Saturn, and mo-
ther of Júpiter, Neptune, and Pluto, &c. She
is also called **CYBELE**, **RHEA**, **BONA DEA**,
MAGNA MATER, **TELLUS**, **TRYA**, &c. See these
articles. Lempriere confounds her with Juno,
Proserpina, and even Minerva; but the mytho-
logy of the ancient Greeks and Romans is a
sufficient mass of confusion and inconsistency,
without confounding the mother with her daugh-
ters and grand-daughters. Her festivals were
the Opalia.

OPTABLE, *adj.* } Lat. *optabilis*. Desirable:
OPTATIVE. } optative, expressive of de-
sire.

The verb undergoes in Greek a different formation
to signify wishing, which is called the *optative* mood.
Clarke.

The **OPTATIVE MOOD**, in the Greek grammar,
is that which serves to express an ardent desire
or wish for something. In most languages, ex-
cept the Greek, the optative is only expressed
by prefixing to the subjunctive an adverb of
wishing; as *utinam*, in Latin.

OPTATUS, bishop of Melevia, a town of
Numidia, in Africa, flourished in the fourth cen-
tury, under Valentinian and Valens. He wrote
a book on the Schism of the Donatists, about
A. D. 370, against Parmenian, bishop of that
sect, which was published by Du Pin at Paris,
in fol. 1700. He also wrote The Sacred Geo-
graphy of Africa. He died A. D. 384.

O P T I C S

OPTIC, *adj. & n. s.* } Fr. *optique*; Gr. *οπ-*
 OPTICAL, *adj.* } *ρασ*. Visual; produc-
 OPTICIAN, *n. s.* } ing or relating to vision;
 OPTICS. } the organ, or an instrument, of sight: optical is relating to vision, or to the science of optics: optician, one skilled in that science, or a maker of optical instruments: optics, the science of vision. See below.

Where our master handleth the contractions of pillars, we have an *optick* rule, that the higher they are, the less should be always their diminution aloft, because the eye itself doth contract all objects, according to the distance. *Wotton.*

Our corporeal eyes we find,
 Dazzle the *opticks* of our mind. *Derham.*

Can any thing escape the perspicacity of eyes which were before light, and in whose *opticks* there is no opacity? *Browne.*

It seems not agreeable to what anatomists and optical writers deliver, touching the relation of the two eyes to each other. *Boyle.*

And quickly cold indifference will ensue,
 When you love's joys through honour's *optick* view. *Prior.*

May not the harmony and discord of colours arise from the proportions of the vibrations propagated through the fibres of the *optick* nerves into the brain, as the harmony and discord of sounds arise from the proportions of the vibrations of the air? *Newton's Opticks.*

Why has not man a microscopick eye?
 For this plain reason, man is not a fly:
 Say what the use, were finer *opticks* given,
 T' inspect a mite, not comprehend the heaven? *Pope.*

Those who desire satisfaction must go to the admirable treatise of *opticks* by Sir Isaac Newton. *Cheyne.*

1. OPTICS, as a science, dates its origin but little prior to the time of Alhazen, an Arabian philosopher of the twelfth century; and it may with truth be remarked that almost every thing useful in the science has originated within the last 500 years. The reflection of the rays of light is, indeed, an occurrence too frequent and too obvious to have escaped the notice of the earliest observers: a river or a fountain was the first mirror: its effect was easily imitated, by specula of metal; and, as soon as any philosophical attention was paid to the phenomenon, it was easy to collect the equality of the angles of incidence and reflection; but, although it was well known that an oar, partially immersed in water, no longer appeared straight, it was long before any attempts were made to ascertain the relation between the angles of coincidence and refraction.

2. Some very important facts illustrative of the nature of LIGHT will be found under that article, and we may now proceed to a brief historical outline of the science.

3. Empedocles is perhaps the first person on record that wrote systematically on light. He maintained that it consisted of particles projected from luminous bodies, and that vision was per-

formed both by the effect of these particles on the eye, and by means of a visual influence, emitted by the eye itself. Both of these doctrines were combated by Aristotle, who thought it absurd to suppose that a visual influence should be emitted by the eye, and that it should not enable us to see in the dark; and who considered it as more probable that light consisted in an impulse, propagated through a continuous medium, than in an emanation of distinct particles. Light, he says, is the action of a transparent substance; and, if there were absolutely no medium between the eye and any visible object, it would be absolutely impossible that we should see it.

4. It is said that Archimedes made a compound burning mirror, of sufficient power to set on fire the Roman ships: in this form the story is scarcely probable, although the possibility of burning an object at a great distance by a collection of plane mirrors has been sufficiently shown by the experiments of Buffon. It is, however, not unlikely that Archimedes was acquainted with the properties of reflecting surfaces, and that he confirmed his theories by some experimental investigations. The work on catoptrics, attributed to Euclid, contains the determination of the effects of reflecting surfaces of different forms; but it is not supposed to be genuine. The existence and the magnitude of the atmospheric refraction were well known to Ptolemy, and a treatise of this astronomer on the subject is still extant in MS.

5. The mathematical theory of optics, or the science of dioptrics and catoptrics made some advances in the middle ages from the labors of Alhazen and Vitellio. Alhazen was mistaken in some of his propositions respecting refraction; Vitellio, a native of Poland, gave a more direct theory of this subject, and constructed a table of refractive densities, showing the supposed proportions of the angles of incidence and refraction in the respective mediums.

6. The invention of the magic lantern is attributed to Roger Bacon, and the lens was soon afterwards commonly applied to the assistance of defective sight. It has been much disputed whether or not Bacon was acquainted with telescopes; the prevalent opinion is, that the passages which have been alleged to prove it are insufficient for the purpose; but there is reason to suspect, from the testimony of Recorde, who wrote in 1551, not only that Bacon had actually invented a telescope, but that Recorde himself knew something of its construction. Digges, also, in a work published in 1571, has a passage of a similar nature; and, from Bacon's own words, it has been conjectured that an instrument resembling a telescope was even of much higher antiquity. But the first person who is certainly known to have made a telescope is Jansen, a Dutchman, whose son, by accident, placing a concave and a convex spectacle glass at a little distance from each other, observed the increased apparent mag-

nitude of an object seen through them; the father upon this fixed two such glasses in a tube a few inches long, and sold the instrument in this form. He also made some telescopes of greater powers, and one of his family discovered a satellite of Jupiter with them. Galileo had heard of the instrument, but had not been informed of the particulars of its construction; he re-invented it in 1609, and, the following year, rediscovered also the satellite which Jansen had seen a little before.

7. It was, however, Kepler that first reduced the theory of the telescope to its true principles; he laid down the common rules for finding the focal lengths of simple lenses of glass; he showed how to determine the magnifying power of the telescope, and pointed out the construction of the simple astronomical telescope, which is more convenient for accurate observations than the Galilean telescope, since the micrometer may be more easily applied to it; a third glass, for recovering the erect position of the object, was afterwards added by Scheiner, and a fourth, for increasing the field of view, by Rheita. Kepler made also some good experiments on the nature of colored bodies, and showed the inverted situation of the image formed on the retina of the eye. Maurolycus of Messina had demonstrated, in 1575, that the pencils of light are brought to focal points on the retina; Kepler's observations were thirty or forty years later.

8. The next great step in optics was made by De Dominis, who in 1611 first explained the cause of the interior or primary rainbow, and this was soon followed by a still more important discovery respecting the nature of refraction, first made by Snellius, who ascertained, about 1621, that the sines of the angles of incidence and refraction are always in the same proportion to each other at the same surface; he died, however, in 1626, without having made his discovery public. Descartes is generally supposed to have seen Snellius's papers, although he published this law of refraction without acknowledging to whom he was indebted for it. Descartes also explained the formation of the secondary rainbow, and truly determined the angular magnitude of both the bows from mathematical principles; he did not, however, give a sufficient reason for the production of colors in either case. Descartes imagined light to consist in motion, or rather pressure, transmitted instantaneously through a medium infinitely elastic, and colors he attributed to a rotatory motion of the particles of this medium. He supposed that light passed more rapidly through a denser medium than through a rarer; other philosophers about the same time maintained a contrary opinion, without deciding with respect to any general theory of light: thus Fermat and Leibnitz deduced, on this supposition, the path of refracted light from the natural tendency of every body to attain its end by the shortest possible way; and Barrow derived the same law, in a more geometrical manner, from a similar hypothesis respecting the velocity of light, by considering a pencil of light as a collection of collateral rays influencing each other's motions. We are indebted to this learned mathematician for the first accurate investigation of the proper-

VOL. XVI.

ties of refracting and reflecting surfaces and for the most general determination of the situations of focal points.

9. The industrious Mr. Boyle had noticed with attention the phosphorescence of diamonds, the colors produced by the effect of scratches on the surfaces of polished metals, and the diversified tints which a bubble or a film of soapy water usually assume. His assistant, Dr. Hooke, investigated these and other similar appearances with still greater accuracy, and proposed, in his *Micrographia*, which was published in 1665, a theory of light considerably resembling that of Descartes: he supposes that light is an impulse propagated through a medium highly, but not infinitely, elastic; that refraction is produced by the readier transmission of light through the denser medium, and that difference of color consists from the law of the different impulse constituting colored light, so that red and blue differ from each other in the same manner as the sound of a violin and of a flute. He explained the colors of thin plates from the interference of two such impulses partially reflected from the upper and under surface; but the hypothesis which he assumed, respecting the nature of colors, renders this explanation wholly inadequate; nor were the phenomena at that time sufficiently investigated for a complete solution of the difficulties attending them.

10. It was still believed that every refraction actually produced color, instead of separating the colors already existing in white light; but in the year 1666 Newton first made the important discovery of the actual existence of colors of all kinds in white light, which he showed to be no other than a compound of all possible colors, mixed in certain proportions with each other, and capable of being separated by refraction of any kind.

11. About the same time that Newton was making his earliest experiments on refraction, Grimaldi's *Treatise on Light* appeared; it contained many interesting experiments and ingenious remarks on the effects of diffraction, which is the name that he gave to the spreading of light in every direction upon its admission into a dark chamber, and on the colors which usually accompany these effects. He had even observed that in some instances the light of one pencil tended to extinguish that of another, but he had not ascertained in what cases and according to what laws such an interference must be expected.

12. The discoveries of Newton were not received without some controversy either at home or abroad; the essential points of his theory were, however, soon established; but Dr. Hooke very warmly opposed the hypothesis which Newton had suggested respecting the nature and propagation of light. On this subject Newton professed himself by no means tenacious; he was not, however, convinced by Dr. Hooke, and disliked the dispute so much that he deferred the publication of his treatise on optics till after Hooke's death in 1703. Very soon after his first communication to the Royal Society, in 1672, he had sent them a description of his reflecting telescope, which was perhaps the first that had been constructed with success; although

O

Gregory had invented his instrument some years before, and a plan of a similar kind had been suggested by Eskinard as early as 1615. The principal parts of the treatise on optics had been communicated at different times to the Royal Society; besides the experiments on refraction, and the theory of the rainbow, they consist of an elegant analysis of the colors of thin transparent substances, in which the phenomena are reduced to their simplest forms, and of a collection of miscellaneous experiments on the colors produced in cases of inflection or diffraction.

13. With respect to the nature of light, the theory which Newton adopted was materially different from the opinions of most of his predecessors. He considered indeed the operation of an ethereal medium as absolutely necessary to the production of the most remarkable effects of light, but he denied that the motions of such a medium actually constituted light; he asserted, on the contrary, that the essence of light consisted in the projection of minute particles of matter from the luminous body, and maintained that this projection was only accompanied by the vibration of a medium as an accidental circumstance, which was also renewed at the surface of every refractive or reflective substance.

14. In the mean time Bartholin had called the attention of naturalists and opticians to the singular properties of the Iceland crystal, and had hastily examined the laws of its unusual refraction. On this subject Huygens had been much more successful; his analysis of the phenomena of the double refraction is a happy combination of accurate experiment with elegant theory; it was published in 1690, making a part of his treatise on light, the fundamental doctrines of which he had communicated to the academy of Paris in 1678. They scarcely differ in their essential parts from those of our countryman Dr. Hooke, but the subject of colors Huygens has left wholly untouched. Roëmer had then lately made the discovery of the immense velocity with which light passed through the celestial regions, by observing the apparent irregularities of the eclipses of Jupiter's satellites; and Huygens readily admitted this property into his system; although Hooke, by a singular caprice, professed himself more ready to believe that the propagation of light might be absolutely instantaneous, than that its motion could be successive, and yet so inconceivably rapid. The merits of Huygens in the mathematical theory of optics were no less considerable than in the investigation of the nature of light; his determination of the observations of lenses was the first refinement on the construction of telescopes.

15. In the year 1720 Dr. Bradley had the good fortune to discover both the existence and the cause of the aberration of the fixed stars. He had for some time observed an irregularity in the places of the stars, which he was wholly unable to explain, and the idea of attributing it to a combination of the effect of the earth's motion in its orbit, with the progressive motion of light, occurred to him first as he happened to observe the apparent direction of the wind on board of a boat which was moving in a transverse direction. He also determined with accuracy the magnitude of the atmospherical refraction, which had been

theoretically investigated by Newton and by Taylor, but never before practically ascertained with sufficient precision. The formula, which Bradley appears to have deduced from observation only, agrees precisely with an approximation which was obtained by Simpson from calculation; but it cannot be considered as rigidly accurate.

16. The optics of Bouguer were first published in 1729, and an improved edition appeared thirty years afterwards; the merits of this author in the examination of the properties of a variety of substances, with respect to the transmission and reflection of light in different circumstances, and in the comparison of lights of different kinds, require to be mentioned with the highest commendation. Dr. Porterfield's investigations of the functions of the eye tended greatly to illustrate the economy of this admirable organ, and some valuable remarks of Dr. Jurin on the same subject were soon after published in Dr. Smith's elaborate treatise on optics, which contains all that had been done at that time with respect to the mathematical part of the science.

17. The invention of achromatic telescopes is with justice universally attributed to our countryman Mr. Dollond; but there is reason to believe that he was not absolutely the first author of the improvement. Mr. Hall, a gentleman of Worcestershire, is said to have discovered, about 1729, Sir Isaac Newton's mistake, in supposing that the rays of different colors must of necessity be equally separated by all surfaces which produce an equal mean refraction; and, by combining the different dispersive properties of different kinds of glass, he constructed, in 1733, several compound object glasses, which were calculated not only for avoiding all appearance of color, but also for correcting the imperfect refractions of the spherical surfaces of the separate lenses. He did not, however, make known the particulars of his investigations, and his invention was soon wholly forgotten. It was in consequence of a discussion with Euler, Klingenstierna, and some other mathematicians, that Mr. Dollond was led to make experiments on the refraction of different kinds of glass; these gentlemen had not questioned the general truth of Newton's opinion respecting the dispersion of the different colors, but Euler had asserted that the eye itself produced a refraction free from the appearance of color, and Klingenstierna had shown the possibility of producing a deviation by refraction, without a separation of color, according to the laws of refraction laid down by Newton himself. When Dollond had once discovered the material distance which exists between the dispersive properties of flint glass and of crown glass, it was easy to produce the combination required; but this ingenious artist was not satisfied with the advantage of freedom from colors only; he adjusted the forms and apertures of his lenses in the most skilful manner to the correction of aberrations of various kinds, and he was also particularly fortunate in being able to obtain, about the time of his discovery, a glass of a quality superior to any that has been since manufactured.

18. The opinion of Euler respecting the eye was, however, by no means well founded; for the

eye acts very differently in rays of different colors, as we may easily observe by viewing a minute object in different parts of a beam of light, transmitted through a prism. It must be allowed that this great mathematician was less fortunate in his optical theories than in many other departments of science; his mathematical investigations of the effects of lenses are much more intricate and prolix than the subject actually requires, and, with respect to the nature and propagation of light, he adopted several paradoxical opinions. Assuming the theory of Huygens, with the additional hypothesis respecting the nature of colors which had been suggested by Newton, and maintained by Pardies and Malebranche; that is, that the difference of colors, like that of tones in music, depends on the frequent differences of the vibrations constituting light; he imagined that opaque bodies are not seen by reflected light, but that their particles are agitated by the impulse of the light which falls on them, and that the vibrations of these particles render the bodies again visible in every direction; he also conceived that the undulations of light are simply propagated through the solid substances of transparent mediums, in the same manner as sound travels through the air. But, on these suppositions, all bodies would have the properties of solar phosphori, and the refraction of the rarest of natural bodies would be incomparably greater than that of the densest is actually found to be: and on the whole, although the character of Euler has been so highly and so deservedly respected as to attach a certain degree of authority to all his opinions, so that in this instance the name of Huygens has been almost superseded by that of Euler, yet in fact he has added no augmentative evidence whatever to the theory, but, by inaccurate and injudicious reasoning, has done a real injury to the cause which he endeavoured to support.

19. The researches of Lambert may be considered as a continuation of those of Bouguer; they present us with many interesting observations on the natural history of light, and the properties of various bodies with regard to it. Mr. Lambert first ascertained that a luminous surface emits its light very nearly with equal intensity in all directions, so that any part of it appears almost equally brilliant to an eye placed in any direction, while the light thrown by each square inch or square foot of the surface in any direction differs according to the obliquity of that direction. The mathematical theory of optics is considerably indebted to the labors of Clairault, D'Alembert, and Boscovich; Jeaurat, Beguelin, Redern, and Klugel, have also continued the investigation; their calculations may be of considerable utility to the practical optician; but it requires the ingenuity of a Dollond or a Ramsden to apply the whole of the results to any useful purposes.

20. The experiments of Mazcas on the colors of their plates are mere repetitions of those of Newton, under disadvantageous circumstances. Mr. Dutour has, however, considerably diversified and extended these experiments, as well as those on the colors which are produced in diffracted light, yet without obtaining any general

results of importance. Corparetti's experiments on inflection have every appearance of accuracy; but they are much too intricate to be easily compared with each other, or with those of former observers.

21. The late Dr. Priestley rendered an essential service to the science of optics, considered as a subject for the amusement of the general reader, by an elegant and well-written account of the principal experiments and theories, which had been published before the year 1770. But this work is very deficient in mathematical accuracy; and the author was not sufficiently master of the science to distinguish the good from the indifferent.

22. Mr. Delaval's experiments on colors appear to show very satisfactorily, that all the coloring substances in common use owe their tints to rays, which are separated from white light during its passage through them, and not, as Newton supposed, to the reflection of a particular color from the first surface. It has been observed that Kepler and Zuechius had long ago made experiments nearly similar to those of Mr. Delaval. Dr. Robert Darwin's investigation of the effects of strong lights on the eye appears to comprehend almost all possible varieties of these ocular spectra; but it does not lead to any fundamental analogy capable of explaining the most intricate of them.

23. The phenomena of the unusual atmospheric refraction, which frequently produces double or triple images of objects seen near a heated surface, have been successfully illustrated by Mr. Huddart, Mr. Vince, and Dr. Wollaston; so that at present there appears to be little doubt remaining with respect to their origin. Dr. Wollaston's instrument, for the measurement of refractive densities, very much facilitates the examination of the optical properties of substances of various kinds; he has applied it very successfully to the confirmation of Huygens's theory of double refraction; he has corrected the common opinion respecting the division of the prismatic spectrum; he discovered, without being acquainted with the observations of Ritter, the dark rays which blacken the salts of silver; and he has remarked a single property in some natural as well as artificial crystals, which appear of one color when viewed in the direction of the axis, and of another when in a transverse direction.

24. To Dr. Herschel the sciences of optics and astronomy are equally indebted. He has carried the construction of the reflecting telescope to a degree of perfection far exceeding all that had been before attempted; and the well known improvements which astronomy has derived from his observations are numerous and important. In the course of his researches for the attainment of his more immediate objects he has also had the good fortune to discover the separation of the rays of heat from those of light by refraction; a fact which has been sufficiently established by the experiments of several other persons.

25. We must now furnish a brief sketch of the labors of the experimental philosophers:—Euclid, the well known author of the Elements of Geometry, appears to have been the first amongst the ancients celebrated for his know-

ledge of optical science. This distinguished geometer did not venture to offer a decided opinion respecting the nature of light; but contented himself with remarking some of its ordinary properties, and applying them to the purposes of human vision. Aristotle has given a definition of light similar to that of motion—the act or energy of a transparent body, inasmuch as it is transparent; and, in proceeding to speculate upon its nature, he altogether denied it to be a substance. This opinion he founded upon the apparently instantaneous transmission of light in any direction. For, as he argued on the general rule, that bodies move with a velocity inversely as the quantity of matter which they contain, light could not, in his estimation, be a material substance, or, the inconceivable velocity of its particles could not be established. As it is not our intention to present an analysis of the opinions of the ancients respecting the nature of light, we shall proceed to a period in its history of the utmost importance to the science of optics; we refer to the foundation of the Cartesian school of philosophy. What has been said respecting the opinions of the ancients is merely intended to show that Descartes, in denying the materiality of light, has only pursued the path marked out by his predecessor Aristotle; though it must be acknowledged that his views of the subject are far more scientific.

26. The opinion of Descartes, and many other modern philosophers of the French school, was, that light is an extremely subtle fluid, pervading the whole sphere of the universe, and receiving from bodies of a luminous nature a series of agitations similar to those excited in a sonorous body by the intervention of the atmospheric air. This theory has undergone some revision, and been somewhat corrected by such modern enquirers as have adopted it; who, to reconcile it with the ordinary and received ideas of the reflection and propagation of light, have supposed its particles to be elastic, and, instead of existing in a state of perfect contiguity, to have small intervals between them. According to this hypothesis, therefore, a ray of light consists of a succession of molecules, having a number of oscillations continually repeated. Now, a very great objection to this theory of the French philosopher appears to exist in the rectilinear direction of light; a principle that was discovered by Euclid, and has been subsequently confirmed by minute and conclusive experiments. For, upon this supposition, light would not only be propagated in a direct line, but, like sound, would be transmitted in every direction; the consequence of which would be the exclusion of night, and the impossibility of a phenomenon that has been frequently exhibited in the total eclipse of the sun.

27. Notwithstanding these great objections to the theory of light we have referred to, so great was the estimation in which the French philosopher was held by the scientific world during the age in which he lived, that no one ventured to dispute its accuracy, until it found an irresistible opponent in Sir Isaac Newton. The theory of this great mathematician and experimentalist, to which modern philosophy has given a decided

preference, consists in the materiality of light. According to this principle, the origin of light is to be traced to an actual emanation, or emission, of particles of luminous bodies thrown off in continued succession, and succeeding one another without interruption. The objections which have been urged against this hypothesis are altogether inconsistent with a just idea of the true nature of light, and possess none of that force by which the objections to the hypothesis of Descartes are accompanied. It has been objected, that, upon the indulgence of this supposition, the rays of light continually emitted from the sun and stars would interfere with each other; and, consequently, prevent their procedure in a rectilinear direction. This difficulty, which is certainly the greatest that has hitherto been adduced, may be readily obviated by taking into consideration the extreme minuteness of the luminous particles, and the disparity which there is between the length of their diameters and relative distance from each other.

28. Having adverted to the Newtonian theory of the materiality of light, it now becomes an object of considerable importance and interest to investigate the nature of its particles. We have already hinted at their extreme minuteness. This may be illustrated by reference to a very simple experiment. If a small hole be made with a needle in a sheet of paper, a spectator lying in a position horizontal to the surface of the earth, and looking through the aperture thus made, would be able to see all the objects in the celestial hemisphere. Now, upon the principle we have stated above, the rays of light, proceeding from the several objects of vision to which the eye of the spectator has been directed, must, of necessity, pass through the aperture at once, without the slightest collision of their particles. Nor will it appear incredible that these myriads of rays should be transmitted through the aperture without the appearance of interruption, when we consider their relative proportion to each other. The utmost efforts of human skill and ingenuity have been directed to the construction of the most delicate optical instruments (as in the case of solar microscopes); and, although they have succeeded in refracting the rays of light to an almost inconceivable extent, yet have hitherto experienced an entire failure in the attempt to discover the distinct particles of this subtle fluid.

29. Another experiment, in illustration of the extreme minuteness of the particles of light, is equally conclusive. If a candle be lighted and placed on an elevation, and no object intervene to obstruct the progress of its rays, it will diffuse itself over an entire space of two miles and upwards in every direction, and form, in itself, a concentric circle, having a diameter of four miles in extent; and this distribution of rays is effected without any sensible diminution of the original luminous body. If the principles we have stated need further confirmation, we may refer to the passage of light through the pores of diamonds, and other gems of a vitreous nature, which have hitherto eluded the detection of the most accurate microscopes.

30. The inconceivable velocity of light is a

Fig. 1.

Fig. 7.

Fig. 8.

Fig. 3.

Fig. 5.

Fig. 2.

Fig. 4.

Fig. 6.

principle which may be no less satisfactorily explained than the minuteness of its particles. The propagation of light was, for a long period, supposed to be instantaneous; because no method that had been adopted had succeeded in marking the degree of its velocity. Astronomers had previously ascertained the fact, that the distance of the sun, the great source of light, from the earth, is about 95,000,000 of miles; and that a cannon ball, travelling with uniform velocity from the earth, would scarcely measure the distance in twenty-five years. The fixed stars had been previously determined to be still more remote; and yet the rays of light were known to be emitted from all these luminaries, and to arrive at the earth, comparatively, in a very short time. But, whilst the general fact of the rapidity of light might have been felt to be fully established by these familiar occurrences, it was evident that they could furnish no data by which to ascertain the degree of its velocity. Rømer, a Danish philosopher, who flourished in the seventeenth century; and Cassini, an astronomer born at Piedmont in 1635, discovered a rule by which to determine this velocity. They observed the eclipses of the satellites of Jupiter, and discovered that they are visible to us about eight minutes sooner (according to Dr. Bradley, eight minutes and thirteen seconds), than they ought to be when the earth is placed between the sun and this planet. On the other hand, it was remarked that, when the sun was between the planet Jupiter and the earth, the appearance of these eclipses was first observed about eight minutes later than it ought to have been, from accurate calculations previously made. Hence it was inferred that light occupies about eight minutes in traversing the distance between the sun and earth, which we have already stated has been estimated at about 95,000,000 of miles.

31. The above will be better understood by referring to plate I, OPTICS, fig. 1. Let A be the sun, and BC DE the annual orbit of the earth round the sun; let the small circle at F represent the planet Jupiter, GHI the orbit of the nearest satellite, which, entering the shadow of Jupiter at G, comes out at the point H. When the earth is at B, in its annual progress round the sun, and the satellite is observed to come out of the shadow, the same emersion will be again perceived in $42\frac{1}{2}$ hours. Suppose the earth to remain constantly at B, then, in $42\frac{1}{2}$ hours multiplied by 50 (or $42\frac{1}{2} \times 50 = 2125$ hours), there would be fifty distinct emersions perceptible. Let the earth, however, be removed further from Jupiter towards C; then, if the doctrine of Descartes be not true, or, in other terms, if a portion of time be requisite for the transmission of light, the emersion of the satellite must be obscured as much later than $42\frac{1}{2}$ hours $\times 50$ as the time may amount to—that is, occupied in the transmission of light over the space KC, which is the difference of the spaces CG and KG. In fact, the time consumed by the passage of light over the space KBC must be added to $42\frac{1}{2}$ hours $\times 50$, making $42\frac{1}{2} \times 50 = 2125$ hours + eight

minutes; or, according to Dr. Bradley's computation, eight minutes and thirteen seconds.

32. To afford a more simple illustration of the prodigious velocity of light, we may refer to many facts of daily occurrence. For instance, we perceive the flash of a gun; but, perhaps, a second or two may elapse before we hear the report produced by its discharge. Of the same nature is the flash of lightning which illuminates the celestial hemisphere, and may be succeeded by the peal of thunder after the lapse of several minutes. Hence, we infer, that, whatever may be the rate at which sound travels, the rapidity of light is far greater.

33. The rectilinear propagation of light was known to the ancients; and in modern times has been abundantly confirmed by experiments. Every luminous body emits continually small particles of matter from its surface, which proceed in straight lines, and in every direction, until they meet with some resisting medium. When this, therefore, occurs—when the rays of light fall on the superficies of a dense and opaque substance, through which it is impossible for them to pass, they do not travel round it, but are altogether stayed in their course; and must, either by turning back again, form what philosophers call the angle of incidence, or be completely absorbed. No contrivance of man has hitherto been able to cause them to move in a curvilinear direction.

34. We have already stated the immense velocity with which light is emitted from the sun's body, and it will be easy to conceive that it cannot suffer any change in velocity or direction, till it meets with some ponderable matter. In approaching any planetary body, such as our earth, we have reason to believe that they are mutually attracted. Rays falling perpendicularly upon the atmosphere are equally attracted on every side, and come in a straight line to the earth; while those rays which fall obliquely are hent out of their original direction; and, since the atmosphere is not of uniform density, such oblique rays will come to the earth in curved lines. If our atmosphere were of uniform density, the refraction would not be altered; but the oblique rays falling upon its surface would be reflected in a very great degree; a circumstance which would deprive us of much of the sun's light. No doubt a great quantity of light becomes extinguished in its passage through the aerial medium, as we may justly learn from the difference of intensity in the light at different altitudes of the sun: but how much must this loss of light appear, when we recur to the statement already made, namely, that the whole effects of the sun's light would be lost by passing through 679 feet of sea-water, and that the same effect would take place by its passage through 3,110,310 feet of air!

35. The following is a table from M. Bouguer, showing the intensity of the sun's light at different altitudes, and the thickness of air it has to penetrate at each angle.

| Sun's altitude. | Thickness of air in toise. | Intensity of light, the whole being 10,000. |

36. When a ray of light falls upon the surface of a body it is either reflected, absorbed, and extinguished, or transmitted. And under some circumstances all these effects take place.

37. If the object be at A, oblique to the surface DE of the looking-glass, and a person wishes to see it in the glass at C, the eye must be at *a*, because the angle of incidence ACF is equal to the angle of reflection FCA. If the object be at B the eye must be at *b* to see it at C in the glass; for the angle of incidence BCF is equal to the angle of reflection FCB.

38. The reflection of the ray depends, 1st, Upon the nature of the body; 2dly, Upon the

state and color of the surface; and 3dly, Upon the quantity of the angle of incidence. Under all these circumstances, however, the angle at which the ray is reflected is equal to the angle of incidence. The same laws, therefore, which govern the collision between perfectly elastic bodies and absolutely hard surfaces, may be applied to the reflection of light. Of the different bodies which reflect light, metals possess this power in the greatest degree, and perhaps in proportion to their density and hardness. Smooth or polished surfaces reflect more light than rough ones.

39. Of colored surfaces the lightest colors reflect the most; hence the whitest metals make the best reflectors. The order will, therefore, in all probability, be as follows, beginning with the best reflectors:—white, yellow, red, blue, black. The two extremes are very striking in the well known experiment of two pieces of cloth, one white and the other black, laid on the surface of snow in the sun. The black piece very soon sinks into the snow, from absorbing a greater quantity of light, which causes the heat. The white piece reflects a greater portion, and is longer in becoming heated. With regard to the quantity of reflection, as affected by the angle of the incidence, it is found that opaque bodies are more heated as the rays strike their surfaces more perpendicularly, and the quantity of light which enters transparent bodies is the same. In both instances, therefore, more light enters the bodies, and less is reflected. In the first instance the light which is not reflected becomes extinguished, producing heat; in the second it is transmitted, still retaining the property of light. Hence, therefore, we ought to conclude that the reflection will be inversely as the angle of incidence, supposing the angle to be formed by the ray and the surface of the medium.

40. M. Bouguer has informed us that the light reflected from a surface of mercury, when the angle of incidence was $11^{\circ} 30'$, was only equal to one-fourth of the whole, and he thinks it probable that no substance reflects more. It is certain, however, that polished silver reflects much more. The same philosopher observes that the metallic reflectors change less in their power of reflection with the angle of incidence. He made the following experiment with polished black marble:—At an angle of $3^{\circ} 35'$ with the reflecting surface, $\frac{1}{6}$ were reflected, the whole being unity; at 15° of incidence $\frac{1}{156}$ were reflected; at 30° , $\frac{1}{551}$; and at 80° , $\frac{1}{523}$. The rest of course became extinguished, and would heat the marble.

41. A similar diminution of the reflective power, with the angle of incidence, is observed in transparent bodies by the same author. The following table gives the results with water and plate glass:—

| Angle of incidence. | The quantity of light reflected, the whole being 1000. | |
|---------------------|--|-------------------|
| | From water. | From plate glass. |
| 0 | 721 | |
| 1 | 692 | |
| 1½ | 669 | |
| 2 | 639 | |
| 2½ | 614 | 584 |
| 5 | 501 | 543 |
| 7½ | 409 | 474 |
| 10 | 433 | 412 |
| 12½ | 271 | 356 |
| 15 | 211 | 299 |
| 17½ | 178 | |
| 20 | 145 | 222 |
| 25 | 97 | 157 |
| 30 | 65 | 112 |
| 40 | 34 | 57 |
| 50 | 22 | 34 |
| 60 | 19 | 27 |
| 70 | 18 | 25 |
| 80 | 18 | 25 |
| 90 | 18 | 25 |

42. The reflections in this instance are partly made from the upper, and the rest from the under surface. The remainder of the 1000 parts are transmitted, with the exception of a few which are in all probability extinguished.

43. That, under certain circumstances, the rays of light are extinguished, even in transparent bodies, is rendered highly probable by the above enquirer. M. Bouguer tells us that, if our atmosphere were 518,385 toises in height, we should have no light from the sun, even in his meridian splendor. It has been estimated that, of the horizontal sun-beams passing through about 200 miles of air, $\frac{1}{30170}$ th part only reaches us.

44. The nature of REFRACTION will be fully discussed under that department of our work, and we only allude to it in the present instance to illustrate the passage of a ray of light through media differing in their density. In the accompanying diagram A is a medium of air, B, a me-

dium of water, or plain glass. The ray CD falling obliquely on the surface of the medium B, is bent at D, and goes on in the direction DE. But the ray FG, falling perpendicularly on the surface of the medium B, goes on in the same straight direction GH.

45. Light, in passing within a certain distance of the surface of bodies, is bent so as to form

apparently a rectilinear angle at that place. Thus, if a small hole be made in the shutter of a window of a darkened room, and the light of the sun be permitted to pass through it, the image of the sun, or white spot which is formed upon a screen placed to receive that light in the room, will be found to be larger than it ought to be if right lined rays proceeded from the various points of the sun's surface, and passed through the hole to the screen; hence it appears that they are bent at the hole; for otherwise the image would be smaller than experience shows it to be.

46. This property of light was not discovered till about the middle of the seventeenth century. The person who first made the discovery was F. Grimaldi; at least he first published an account of it in his treatise *De Lumine, Coloribus, et Iríde*, printed in 1666. Dr. Hooke, however, laid claim to the same discovery, though he did not publish his observations till six years after Grimaldi.

47. Dr. Hooke, having made his room completely dark, admitted into it a beam of the sun's light by a very small hole in a brass plate fixed in the window shutter. This beam, spreading itself, formed a cone, the apex of which was in the hole, and the base was on a paper, so placed as to receive it at a distance. In this image of the sun, thus painted on the paper, he observed that the middle was much brighter than the edges, and that there was a kind of dark penumbra about it, of about a sixteenth part of the diameter of the circle; which penumbra, he says, must be ascribed to a property of light, which he promised to explain.—Having observed this, at the distance of about two inches from the former, he let in another cone of light; and, receiving the bases of them at such a distance from the holes as that the circles intersected each other, he observed that there was not only a penumbra, or darker ring, encompassing the lighter circle, but a manifest dark line, or circle, which appeared even where the limb of the one interfered with that of the other.

48. The shadows of all bodies, metals, stones, glass, wood, horn, ice, &c., in this light were bordered with three parallel fringes, or bands of colored light, of which that which was contiguous to the shadow was the broadest and most luminous, while that which was the most remote was the narrowest, and so faint as not easily to be visible. It was difficult to distinguish these colors unless when the light fell very obliquely upon a smooth paper, or some other smooth white body, so as to make them appear much broader than they would otherwise have done; but in these circumstances the colors were plainly visible, and in the following order. The first or innermost fringe was violet, and deep blue next the shadow, light blue, green, and yellow in the middle, and red without. The second fringe was almost contiguous to the first, and the third to the second; and both were blue within and yellow and red without; but their colors were very faint, especially those of the third. The colors, therefore, proceeded in the following order from the shadow: violet, indigo, pale blue, green, yellow, red; blue, yellow, red; pale blue, pale yellow, and red. The shadows made by

scratches and bubbles in polished plates of glass, were bordered with the like fringes of colored light. By looking on the sun through a feather, or black riband, held close to the eye, several rainbows will appear, the shadows which the fibres or threads cast on the retina being bordered with the like fringes of colors. Measuring these fringes and their intervals, with the greatest accuracy, he found the former to be in the progression of the numbers, $1, \sqrt{\frac{1}{2}}, \sqrt{\frac{1}{3}},$ and their intervals to be in the same progression with them, that is, the fringes and their intervals together to be in continual progression of the numbers $1, \sqrt{\frac{1}{2}}, \sqrt{\frac{1}{3}}, \sqrt{\frac{1}{4}}, \sqrt{\frac{1}{5}},$ or thereabouts. And these proportions held the same very nearly at all distances from the hair, the dark intervals of the fringes being as broad in proportion to the breadth of the fringes at their first appearance as afterwards, at great distances from the hair, though not so dark and distinct.

49. In Sir Isaac's observations we find a very remarkable and curious appearance, pretty similar to the one noticed by Dr. Hooke. The sun shining into his darkened chamber, through a hole three-fourths of an inch broad, he placed at the distance of two or three feet from the hole, a sheet of pasteboard, black on both sides; in the middle of it he made a hole about one-fourth of an inch square, for the light to pass through; behind the hole he fastened to the pasteboard the blade of a sharp knife, to intercept some part of the light which passed through the hole. The planes of the pasteboard and blade of the knife were parallel to one another, and perpendicular to the rays; and when they were so placed that none of the light fell on the pasteboard, but all of it passed through the hole to the knife, and there part of it fell upon the blade of the knife, and part of it passed by its edge, he let that part of the light which passed by fall on a white paper, two or three feet beyond the knife, and there saw two streams of faint light shoot out both ways from the beam of light into the shadow, like the tails of comets. But because the sun's direct light, by its brightness upon the paper, obscured these faint streams, so that he could scarce see them, he made a little hole in the midst of the paper for that light to pass through and fall on a black cloth behind it: and then he saw the two streams plainly. They were like one another, and pretty nearly equal in length, breadth, and quantity of light. Their light, at that end which was next to the sun's direct light, was pretty strong for the space of about one-fourth of an inch, or half an inch, and decreased gradually till it became insensible. The whole length of each of these streams, measured upon the paper, at three feet from the knife, was about six or eight inches; so that it subtended an angle, at the edge of the knife, of about 10° or 12° , or at most 14° . Yet sometimes he thought he saw it shoot 3° or 4° farther; but with a light so very faint that he could hardly perceive it. This light he suspected might, in part, arise from some other cause than the two streams; for, placing his eye in that light, beyond the end of that stream which was behind the knife, and looking towards the knife, he could see a line of light upon its edge; and that not only when his eye

was in the line of the streams, but also when it was out of that line, either towards the point of the knife or towards the handle. This line of light appeared contiguous to the edge of the knife, and was narrower than the light of the innermost fringe, and narrowest when his eye was farthest from the direct light; and therefore seemed to pass between the light of that fringe and the edge of the knife; and that which passed nearest the edge seemed to be most bent, though not all of it. He then placed another knife by the former, so that their edges might be parallel, and look towards one another, and that the beam of light might fall upon both the knives and some part of it pass between their edges. In this situation he observed that, when the distance of their edges was about the 400th part of an inch, the stream divided in the middle, and left a shadow between the two parts. This shadow was so black and dark that all the light which passed between the knives seemed to be bent and turned aside to the one hand or the other; and, as the knives still approached one another, the shadow grew broader, and the streams shorter next to it, till, upon the contact of the knives, all the light vanished.

50. From this experiment he concludes that the light which is least bent, and which goes to the inward ends of the streams, passes by the edges of the knives at the greatest distance; and this distance, when the shadow began to appear between the streams, was about the 800th part of an inch; and the light which passed by the edges of the knives, at distances still less and less, was more and more faint, and went to those parts of the streams which were farther from the direct light; because, when the knives approached one another till they touched, those parts of the streams vanished last which were farthest from the direct light. In the experiment of one knife only, the colored fringes did not appear; but, on account of the breadth of the hole in the window, became so broad as to run into one another, and, by joining, to make one continued light in the beginning of the streams; but in the last experiment, as the knives approached one another, a little before the shadow appeared between the two streams, the fringes began to appear on the inner ends of the streams, on either side of the direct light; three on one side, made by the edge of one knife, and three on the other side, made by the edge of the other knife. They were most distinct when the knives were placed at the greatest distance from the hole in the window, and became still more so by making the hole less; so that he could sometimes see a faint trace of a fourth fringe beyond the three above-mentioned: and, as the knives approached one another, the fringes grew more distinct and larger, till they vanished; the outermost vanishing first, and the innermost last. After they were all vanished, and the line of light which was in the middle between them was grown very broad, extending itself on both sides into the streams of light described before, the above-mentioned shadow began to appear in the middle of this light, and to divide it along the middle into two lines of light, and increased till all the light vanished. This enlargement of the fringes was so

great, that the rays which went to the innermost fringe seemed to be bent about twenty times more when the fringe was ready to vanish, than when one of the knives was taken away.

51. From both these experiments, compared together, Sir Isaac concludes that the light of the first fringe passed by the edge of the knife at a distance greater than the 800th part of an inch; that the light of the second passed by the edge of the knife at a greater distance than the light of the first fringe, and that of the third at a greater distance than that of the second; and that the light, of which the streams above-mentioned consisted, passed by the edges of the knives at less distances than that of any of the fringes.

52. He then got the edges of two knives ground truly straight, and attaching them to a board, so that their edges might look towards one another, and, meeting near their points, contain a rectilinear angle, he fastened their handles together, to make the angle invariable. The distance of the edges of the knives from one another, four inches from the angular point, where the edges of the knives met, was the eighth part of an inch; so that the angle contained by their edges was about $1^{\circ} 54'$. The knives being thus fixed together, he placed them in a beam of the sun's light let into his darkened chamber, through a hole the forty-second part of an inch wide, ten or thirteen feet from the hole; and he let the light which passed between their edges fall very obliquely on a smooth white ruler, half an inch or an inch from the knives; and there he saw the fringes made by the two edges of the knives run along the edges of the shadows of the knives, in lines parallel to those edges, without growing sensibly broader, till they met in angles equal to the angle contained by the edges of the knives; and where they met and joined they ended, without crossing one another. But if the ruler was held at a much greater distance from the knives, the fringes, where they were farther from the place of their meeting, were a little narrower, and they became something broader as they approached nearer to one another, and after they met they crossed one another, and then became much broader than before. From these observations he concluded that the distances at which the light composing the fringes passed by the knives were not increased or altered by the approach of the knives, but that the angles, in which the rays were there bent, were much increased by that approach; and that the knife which was nearest to any ray determined which way the ray should be bent, but that the other knife increased the bending.

53. When the rays fell very obliquely upon the ruler, at the distance of a third part of an inch from the knives, the dark line between the first and second fringe of the shadow of one knife, and the dark line between the first and second fringe of the shadow of the other knife, met one another, at the distance of the fifth part of an inch from the end of the light which passed between the knives, where their edges met one another; so that the distance of the edges of the knives, at the meeting of the dark lines, was the 160th part of an inch; and one half of that light passed by the edge of one knife, at a distance

not greater than the 320th part of an inch, and, falling upon the paper, made the fringes or the shadow of that knife; while the other half passed by the edge of the other knife, at a distance not greater than the 320th part of an inch, and, falling upon the paper, made the fringes of the shadow of the other knife. But, if the paper was held at a distance from the knives greater than the third part of an inch, the dark lines above-mentioned met at a greater distance than the fifth part of an inch from the end of the light which passed between the knives, at the meeting of their edges; so that the light which fell upon the paper where those dark lines met passed between the knives, where their edges were farther distant than the 160th part of an inch. For at another time, when the two knives were eight feet and five inches from the little hole in the window, the light which fell upon the paper where the above-mentioned dark lines met passed between the knives, where the distance between their edges was, as in the following table, at the distances from the paper there noted:—

| 54. Distances of the paper from the knives in inches. | Distances between the edges of the knives in millesimal parts of an inch. |
|---|---|
| 1 $\frac{1}{4}$ | 0012 |
| 3 $\frac{1}{4}$ | 0020 |
| 8 $\frac{1}{4}$ | 0034 |
| 32 | 0057 |
| 96 | 0081 |
| 131 | 0087 |

55. From these observations he concluded that the light which makes the fringes upon the paper is not the same light at all distances of the paper from the knives; but that, when the paper is held near the knives, the fringes are made by light which passes by the edges of the knives at a less distance, and is more bent than when the paper is held at a greater distance from the knives.

56. When the fringes of the shadows of the knives fell perpendicularly upon the paper, at a great distance from the knives, they were in the form of hyperbolas, their dimensions being as follows:—Let CA , CB , fig. 2, represent lines drawn upon the paper, parallel to the edges of the knives; and between which all the light would fall if it suffered no inflection. DE is a right line drawn through C , making the angles ACD , BCE , equal to one another, and terminating all the light which falls upon the paper, from the point where the edges of the knives meet. Then eis , fkt , and glv , will be three hyperbolic lines, representing the boundaries of the shadow of one of the knives, the dark line between the first and second fringes of that shadow, and the dark line between the second and third fringes of the same shadow. Also xip , ykg , and zlr , will be three other hyperbolic lines, representing the boundaries of the shadow of the other knife, the dark line between the first and second fringes of that shadow, and the dark line between the second and third fringes of the same shadow. These three hyperbolas are similar, and equal to the former three, and cross them in the points i , k , and l ; so that

the shadows of the knives are terminated, and distinguished from the first luminous fringes, by the lines eis and xip , till the meeting and crossing of the fringes; and then those lines cross the fringes in the form of dark lines terminating the first luminous fringes on the inside, and distinguishing them from another light, which begins to appear at i , and illuminates all the triangular space $ipDEs$, comprehended by these dark lines and the right line DE . Of these hyperbolas one asymptote is the line DE , and the other asymptotes are parallel to the lines CA and CB . The sun shining into his darkened room, through the small hole mentioned above, he placed at the hole a prism to refract the light, and to form on the opposite wall the colored image of the sun; and he found that the shadows of all bodies held in the colored light, between the prism and the wall, were bordered with fringes of the color of that light in which they were held; and, comparing the fringes made in the several colored lights, he found that those made in the red light were the largest, those made in the violet were the least, and those made in the green were of a middle bigness. For the fringes with which the shadow of a man's hair were bordered, being measured across the shadow, at six inches from the hair, the distance between the middle and most luminous part of the first or innermost fringe on one side of the shadow, and that of the like fringe on the other side of the shadow, was in the full red light $\frac{1}{4}$ of an inch, and in the full violet $\frac{1}{16}$. The like distance between the middle and most luminous parts of the second fringes, on either side of the shadow, was in the full red light $\frac{1}{8}$, and the violet $\frac{1}{32}$ of an inch; and these distances of the fringes held the same proportion at all distances from the hair without any sensible variation.

57. From these observations it was evident, that the rays which made the fringes in the red light, passed by the hair at a greater distance than those which made the like fringes in the violet; so that the hair, in causing these fringes, acted alike upon the red light or least refrangible rays at a greater distance, and upon the violet or most refrangible rays at a less distance; and thereby occasioned fringes of different sizes, without any change in the color of any sort of light. It may therefore be concluded, that when the hair in the first observation was held in the white beam of the sun's light, and cast a shadow which was bordered with three fringes of colored light, those colors arose not from any new modifications impressed upon the rays of light by the hair, but only from the various inflections whereby the several sorts of rays were separated from one another, which before separation, by the mixture of all their colors, composed the white beam of the sun's light; but, when separated, composed lights of the several colors which they are originally disposed to exhibit.

58. The first person who pursued any experiments similar to those of Newton on inflected light, was M. Maraldi; whose observations chiefly respect the inflection of light towards other bodies, whereby their shadows are partially illuminated; and many of the circumstances

which he noticed relating to it are well worthy of attention. He exposed in the light of the sun a cylinder of wood three feet long and six lines and a half in diameter; when its shadow, being received upon a paper held close to it, was every where equally black and well defined, and continued to be so to the distance of twenty-three inches from it. At a greater distance the shadow appeared to be of two different densities; for the two extremities of the shadow, in the direction of the length of the cylinder, were terminated by two dark strokes, a little more than a line in breadth. Within these dark lines there was a faint light, equally dispersed through the shadow, which formed a uniform penumbra, much lighter than the dark strokes at the extremity, or than the shadow received near the cylinder. As the cylinder was removed to a greater distance from the paper, the two black lines continued to be nearly of the same breadth, and the same degree of obscurity; but the penumbra in the middle grew lighter, and its breadth diminished, so that the two dark lines at the extremity of the shadow approached one another, till, at the distance of sixty inches, they coincided, and the penumbra in the middle entirely vanished. At a still greater distance a faint penumbra was visible; but it was ill defined, and grew broader as the cylinder was removed farther off, but was sensible at a very great distance. A narrow and faint penumbra was also seen on the outside of the dark shadow; and on the outside of this there was a tract more strongly illuminated than the rest of the paper. The breadth of the external penumbra increased with the distance of the shadow from the cylinder, and the breadth of the tract of light on the outside of it was also enlarged; but its splendor diminished with the distance.

59. He repeated these experiments with three other cylinders of different dimensions; and from them all he inferred, that every opaque cylindrical body, exposed to the light of the sun, makes a shadow which is black and dark to the distance of thirty-eight to forty-five diameters of the cylinder which forms it; and that, at a greater distance, the middle part begins to be illuminated in the manner described above. Other rays were deflected from the body, and formed a strong light on the outside of the shadow, and which might at the same time contribute to dilute the outer shadow, though he supposed that penumbra to be occasioned principally by that part of the paper not being enlightened, except by a part of the sun's disk only, according to the known principles of optics. The same experiments he made with globes of several diameters; but he found that, whereas the shadows of the cylinders did not disappear but at the distance of forty-one of their diameters, those of the globes were not visible beyond fifteen of their diameters; which he thought was owing to the light being inflected on every side of a globe, and consequently in such a quantity as to disperse the shadows sooner than in the case of the cylinders. In all these cases the penumbra occasioned by the inflected light began to be visible at a less distance from the body in the stronger light of the

sun than in a weaker, on account of the greater quantity of rays inflected in those circumstances.

60. M. Maraldi, being sensible that the above mentioned phenomena of the shadows were caused by inflected light, was induced to give more particular attention to this remarkable property, and to repeat the experiments of Grimaldi and Sir Isaac Newton in a darkened room. In doing this, he observed that, besides the enlarged shadow of a hair, a fine needle, &c., the bright gleam of light that bordered it, and the three colored rings next to this enlightened part, when the shadow was at a considerable distance from the hair, the dark central shadow was divided in the middle by a mixture of light; and that it was not of the same density, except when it was very near the hair. This new appearance is exactly similar to what he had observed with respect to the shadows in the open day-light above-mentioned.

61. Having placed a bristle in the rays of the sun, admitted into a dark chamber by a small hole, at the distance of nine feet from the hole it made a shadow, which, being received at five or six feet from the object, he observed to consist of several streaks of light and shade. The middle part was a faint penumbra, bordered by a darker shadow, and after that by a narrower penumbra; next to which was a light streak broader than the dark part, and next to the streak of light, the red, violet, and blue colors were seen as in the shadow of the hair. He also placed in the same rays, several needles of different sizes; but the appearances were so exceedingly various and singular, that he does not recite them. He exposed in the rays of the sun, admitted by a small hole into a dark chamber, a plate two inches long, and a little more than half a line broad. This plate being fixed perpendicularly to the rays, at the distance of nine feet from the hole, a faint light was seen uniformly dispersed over the shadow, when it was received perpendicularly to it, and very near. The shadow of the same plate, being received at the distance of two feet and a half, was divided into four very narrow black streaks, separated by small lighter intervals equal to them. The boundaries of this shadow on each side had a penumbra, which was terminated by a very strong light, next to which were the colored streaks of red, violet, and blue, as before.

62. The shadow of the same plate, at four feet and a half distance from it, was divided into two black streaks only, the two outermost having disappeared; but these two black streaks which remained were broader than before, and separated by a lighter shade, twice as broad as one of the former black streaks, when the shadow was taken at two feet and one-third. This penumbra in the middle had a tinge of red. After the two black streaks there appeared a pretty strong penumbra, terminated by the two streaks of light, which were now broad and splendid, after which followed the colored streaks. A second plate, two inches long and a line broad, being placed like the former fourteen feet from the hole by which the rays of the sun were admitted, its shadow, being received perpendi-

cularly very near the plate, was illuminated by a faint light, equally dispersed, as in the preceding plate. But being received at thirteen feet from the plate, six small black streaks began to be visible. At seventeen feet from the plate, the black streaks were broader, more distinct, and more separated from the streaks that were less dark. At forty-two feet from the plate, only two black streaks were seen in the middle of the penumbra. This middle penumbra between the two black streaks was tinged with red. Next to the black streaks there always appeared the streaks of light which were broad, and the colored streaks next to them. Receiving the shadow of the same plate at the distance of seventy-two feet, the appearances were the same as in the former situation, except that the two black streaks were broader, and the interval between them, occupied by the penumbra, was broader also, and tinged with a deeper red.

63. In the same rays of the sun he placed different plates, larger than the former, one of them a line and a half, another two lines, another three lines broad, &c., but receiving their shadows upon paper, he could not perceive in them those streaks of faint light which he had observed in the shadows of the small plates, though he received these shadows at the distance of fifty-six feet. Nothing was seen but a weak light, equally diffused as in the shadows of the two smallest plates, received very near them. The streaks of light in the shadows of needles of a middling size, our author ascribed to the rays of light which are inflected at different distances from the bodies; and he imagined that their crossing one another was sufficient to account for the variations observable in them at different distances. The extraordinary size of the shadows of these small substances M. Maraldi thought to be occasioned by the shadow from the enlightened part of the sky, added to that which was made by the light of the sun, and also to a vortex occasioned by the circulation of the inflected light behind the object.

64. M. Maraldi, having made the preceding experiments upon single long substances, had the curiosity to place two of them so as to cross one another in a beam of the sun's light. The shadows of two hairs placed in this manner, and received at some distance from them, appeared to be painted reciprocally one upon another, so that the obscure part of one of them was visible upon the obscure part of the other. The streaks of light also crossed one another, and the colored streaks did the same. Having placed a needle and a hair crossing one another, their shadows, at the same distance, exhibited the same appearances as the shadows of the two hairs, though the shadow of the needle was the stronger. He also placed in the rays of the sun a bristle and a plate of iron a line thick, so that they crossed one another obliquely; and when their shadows were received at the same distance, the light and dark streaks of the shadow of the bristle were visible so far as the shadow of the plate on the side of the acute angle, but not on the side of the obtuse angle, whether the bristle or the plate were placed next to the ray. The plate made a shadow sufficiently dark, divided

into six black streaks; and these were again divided by as many light ones equal to them; and yet all the streaks belonging to the shadow of the bristle were visible upon it.

65. M. Maraldi exposed several small globes in the light of the sun in his dark chamber, and compared their shadows with those of the long substances, as he had done in the day-light, and the appearances were still similar. There was much more light in the shadows of the globes than in those of the cylinders, not only when they were both of an equal diameter, but when that of the globe was larger than that of the cylinder, and the shadows of both the bodies were received at the same distance. He could perceive no difference of light in the shadows of the plates which were a little more than one line broad, though they were received at the distance of seventy-two feet; but he could easily see a difference of shades in those of the globes, taken at the same distance, though they were two lines and a quarter in diameter. To explain the colors at the edges of these shadows, he contrived to throw some of the shadows upon others; and the following observations, though they did not enable him to accomplish what he intended, are worth reciting:—Having thrown several of the similar colors upon one another, and thereby produced a tinge more lively than before, he threw the gleam of light, which always intervened between the colors and the darker part of the shadow, upon different parts of other shadows; and observed that, when it fell upon the exterior penumbra made by another needle, it produced a beautiful sky-blue color, almost like that which was produced by two blue colors thrown together. When the same gleam of light fell upon the deeper shadow, in the middle, it produced a red color. He placed two plates of iron, each three or four lines broad, very near one another, but with a very small interval between them; and having placed them in the rays of the sun, and received their shadows at fifteen or twenty feet from them, he saw no light between them but a continued shadow, in the middle of which were some streaks of a lively purple, parallel to one another, and separated by other black streaks; but between them there were other streaks, both of a very faint green, and also of a pale yellow.

66. If a solid opaque body, such as a hair, a slender wire, &c., be placed in the stream of light within the room, the size of the shadow of that body will be found different from what it ought to be if the rays of light were not bent in passing by it. This bending of the rays of light by passing, not through, but near the surface of a body, is called the inflection of light.

67. Let X, fig. 3, be the hole (about the fiftieth part of an inch) of the light's passage into a darkened room, and let XA, XB, be lines drawn from each external opposite edge on one side of the solar disc, to each external opposite edge on the contrary side of the hole, crossing one another: XCD will represent the beam of light after its passage through the hole, at all distances therefrom, considerably larger than the penumbral cone EAB.

68. At seven feet from the hole the breadth

of the beam was $\frac{1}{10}$ parts of an inch. If the light had not been bent, that breadth could not have exceeded $\frac{1}{10}$. Hence it must be concluded that the light, being attracted by the sides of the hole, is inflected, and of course caused to proceed more divergently than otherwise it would have done.

69. With a hole one-tenth of an inch wide, or wider, the centre of the beam was composed of the dense direct light of the sun unchanged in its passage; but farther therefrom, towards the borders of the beam, this light began to increase in density, and gradually decayed more and more in the approaches nearer and nearer to the borders, becoming at last considerably diluted and evanescent, and rendering the edge of the beam ill-defined and indistinct.

70. With a smaller hole than the last the central dense light entirely disappeared, and, with a hole yet smaller than this, the external edges of the beam became more condensed and better defined; and the whole beam of light became, as before described, of more uniform density in all its parts. With a hole smaller than any of the foregoing, about $\frac{1}{100}$ th part of an inch wide, various colors began to appear in the beam, the central parts of which became now, in their turn, more diluted than the rest, the external parts denser than these, and bordered with tinges of yellow and red light on the very edge or margin of the beam.

71. All these appearances are to be ascribed to the same attractions of the edges of the holes, and of the different parts of the edges. These, when the hole is large, affect only the parts of the light passing nearest to them; when the hole is reduced they attract and dilate the whole of the passing light; when the hole is yet more considerably diminished, they act, not only each part upon the light passing nearest to each, but each part also upon the light passing nearest to each opposite part of the edge, condensing by diminishing the attraction and diffusion of the light on the edges of the beam, and rendering the whole more equably and uniformly divergent, and these at last, when the hole is in its most reduced state, of about $\frac{1}{100}$ th part of an inch wide, by their various actions produce colors in the passing light.

72. In the beam of solar light passing through the small hole $\frac{1}{100}$ th part of an inch wide, the shadows of very slender bodies, such as pins, needles, straw, hairs, &c., were observed to be considerably broader, as they ought to be in this divergent light, than the bodies themselves; but, as each of these bodies exercises upon the light passing by it the same attractions by which the light is bent in passing through the hole, the author of these experiments concluded that a part of the light would be in every case bent, in passing by, towards the body into the shadow, and illuminate it and diminish its breadth.

73. Across a beam of solar light, admitted into a dark chamber through a small hole in a thin piece of lead, nearly $\frac{1}{100}$ th of an inch wide, a hair of a man's head was interposed, and the beam being received on a screen or sheet of white paper, with an obliquity convenient for the purpose, the following appearances were noted:

74. At the termination of the shadow, whose intensity or darkness was not considerable, the following orders and distinctions of colors appeared. First and nearest to the dark or blue parts of the shadow might be seen a diluted blue, changing into a breadth of white light, followed by breadths of yellow and red. To these succeeded an interval of diluted shade, then breadths of diluted violet, blue, diluted green, yellow, red; then green, diluted yellow, red; diluted green, red; white, diluted red, and finally, white light. These are the more general orders of the colors. Of these orders the three first were sufficiently obvious and distinct; the last evanescent and requiring accommodation of circumstances to produce, and attention to perceive them.

75. When the distance of observation from the hair was very small, and before the first bright streak of light began to appear, the shadow of the hair was distinct and well-defined, and of intense blackness. At a greater distance this shadow appeared to be divided by a parallel line of light throughout its whole length, into two parts, and resembled a double shadow, or the shadows of two hairs, but was by no means of the same degree of blackness as was the single shadow observed close to the hair. At still greater distances it increased in breadth and diminished in blackness, whilst the transverse dimensions of the dividing line of light increased at the same time, until, at a considerable distance from the hair, this intermediate band or line of light began to put on the appearance of colors on its edges, and to assume, on both sides externally, casts of yellowish and reddish light. By further increase of distance this apparent shadow, these dark intervals became more diluted, and of nearly the same color throughout, the line of light more and more diffused, and was at last extinguished by the extreme diffusion and ultimate invisibility of the light that produced it.

76. Whilst at all these different distances these changes proceed in the shadow, and in the light nearest to the body, in the other adjoining parts of the light passing next in order of distance by the hair considerable changes are also produced.

77. The shadow that first appeared close to the hair is perfectly and truly a shadow, being produced by the interception of the passing light by the hair.

78. This shadow, however, quickly ceases to appear, the rays of light nearest to it on both sides of the hair being bent into it at considerable angles of inflexion and dispersion, and crossing, illuminating, and extinguishing it.

79. The rays of light are not only bent, they are also distributed or divided into different rays of different colors, in angles of dispersion greater as the distances are less, and less as the distances are greater, in such a manner that of different colors at the same distance, the purples, blues, greens, yellows, and reds, are bent towards the body; the purples most, each of the others in due succession less, and the reds least, according to the order of their statement; and of colors of the same sorts, at different distances, the nearer more than the more remote, and the more remote less than the nearer. So various, however, are the bendings of different colors at different distances,

that in certain distinct portions of light, and at different distances of observation, the more remote and the nearer rays of different colors contained within each of those portions or divisions of the light, become variously intermingled with each other, and, by their various intermixtures, form each of these divisions into party-colored fringes; whilst, the rays of different divisions never mixing with those of others, the intervals of the divisions are preserved, and become the dark intervals which separate the fringes.

80. The discoveries of M. A. Fresnel respecting the inflexion of light are in the highest degree important, and cannot fail to be regarded as affording a strong confirmation of the Huygenian theory of light. The following is a summary of the principal results:—

81. (1.) M. Fresnel found that the fringes formed by inflexion may be examined by an eye-glass, without receiving them upon a white surface; and, by adapting a micrometer to the eye-glass, he was able to determine their breadths, even to the 100th or 200th part of a millimetre.

82. (2.) By following the external fringes to their origin by means of a lens with a short focus, he perceived the third fringe at the distance of less than the 100th of a millimetre from the edge of the inflecting body.

83. (3.) The inflexion of the passing light is influenced by the distance of the radiating or luminous point from the inflecting body, as appears from the following results:—

| Distance of the radiating point from the body. | Distance behind the body where the inflexion was measured. | Angular deviation or inflexion of the red rays of the first fringe. |
|--|--|---|
| 100 millimetres. | 1 metre. | 12' 6" |
| 6 metres. | 1 metre. | 3' 55" |

84. Hence it follows that the ray suffers a less degree of inflexion in proportion to the distance from which it diverges.

85. (4.) When the inflexion of the same fringe is measured at different distances behind the inflecting body, the distance of the radiant point remaining the same, it is found to be different at different distances; and hence it follows that the successive positions of the same fringe are not in a straight line, but form a curve whose concavity is turned towards the inflecting body. The lines which join the different positions of the fringe of all the orders of colors are hyperbolas, having for their common foci the radiating point and the edge of the inflecting body. In some of M. Fresnel's experiments the sagitta of curvature was about one millimetre, or the twenty-fifth part of an inch, which is nearly fifty times greater than the error of observation.

86. (5.) M. Fresnel measured the fringes produced by various bodies, and found, by accurate measurement, that they all produced the same inflexion, the back of a razor giving the same fringes as its sharp edge.

87. Results of a similar kind were obtained by Dr. Brewster in two sets of experiments, one

of which was made in 1798, and the other in 1812 and 1813. He compared the fringes formed by gold leaf with those made by masses of gold; those formed by films which produced the colors of thin plates with those formed by masses of the same substance. He examined the effects of platinum, diamond, and cork, in inflecting the light; the effects of grooves in metallic surfaces, &c.; and of cylinders of glass immersed in fluids of the same refractive power: and from these he concluded that the Newtonian theory of inflexion could not be true; that the inflexion was not produced by any force inherent in the bodies themselves, but arose from a property of the light itself, which always shows itself when divergent light was stopped in its progress.

88. (6.) The fringes in the interior of the shadow were first explained by Dr. Thomas Young. He showed, in the clearest manner, that they were formed by the interference of two portions of light coming from the opposite sides of the inflecting body. Having introduced the sun's light into a dark room, through two small holes very near each other, he received the admitted light upon a sheet of paper from each of the holes separately, and observed no particular effect. But when the light was admitted through both the holes at the same time, so as to interfere, a series of obscure and brilliant fringes was produced.

89. M. Fresnel obtained a similar effect by reflecting light from two metallic mirrors slightly inclined to each other, and whose surfaces were nearly in the same plane. The formation of these bands depends on the lengths of the paths of two interfering portions of light. When the paths are exactly of the same length, the two portions of light will form a very brilliant fringe, having an intensity greater than that of either portion. If the next brilliant fringe corresponds to a difference of paths equal to d , then other brilliant fringes will be formed when the differences of the paths are $2d$, $3d$, $4d$, &c. When the differences of the paths are $\frac{1}{2}d$; $d + \frac{1}{2}d$; $2d + \frac{1}{2}d$, or $\frac{3}{2}d$, $\frac{5}{2}d$, $\frac{7}{2}d$, the interfering portions neutralise or destroy one another, and consequently produce a black fringe. The quantity d has a different value for the rays of different colors, and varies as the length of the fits in Newton's theory. M. Fresnel has found d to be $\frac{1}{10000}$ th of a millimetre for red light.

90. This beautiful theory of Dr. Young is embraced by M. Fresnel. Both these philosophers had ascribed the exterior fringes to the interference of the direct rays with rays reflected from the margin of the inflecting body. M. Fresnel, however, has since found that this explanation is insufficient; for the real place of the fringe is sometimes $\frac{1}{1000}$ th of a millimetre different from what it should be upon this supposition; and at any rate, if the hypothesis were true, the extent and curvature of the margin of the inflecting body would have an influence upon the intensity of the fringes, which is contrary to experiment. He is therefore obliged to admit that the rays which pass at a sensible distance from the inflecting body are made to deviate from their primitive direction, and cohere also in the production of the colored fringes.

91. It is by no means easy to explain to general readers the hypothesis by which M. Fresnel has accounted for the fringes upon the principle of interference; but we shall attempt to make it as intelligible as possible.

92. Let A M E, fig. 4, be a luminous wave or undulation, propagated from the radiant point C, and partly intercepted by the inflecting body A G. Then, if we suppose it divided into an infinity of small arcs A m, m' m, M n, n' n', n'' n'', &c., M. Fresnel obtains the intensity of any point (P) of the wave A M E, when it has reached the position B P D, by supposing elementary waves to be propagated from every point m, m', M, n, n', &c., of its preceding position at A M E. These elementary waves are propagated in all directions, and with intensities sensibly equal when they do not deviate much from the perpendicular. M. Fresnel does not take into account the waves which are most inclined, and which, according to his hypothesis, destroy one another; and in this way he determines the intensity of the light resulting from the reciprocal influence of all the rays which are slightly inclined to the perpendicular. By thus combining the principle of Huygens with Dr. Young's law of interference, he has obtained a formula which represents the observations with surprising accuracy.

93. (7) The phenomena of inflexion are considered by M. Fresnel to be inexplicable on the Newtonian theory of the emission of luminous particles; while almost all of them may be directly deduced from the Huygenian Theory of Undulations.

94. There are two very important and comparatively new branches of optical science to which we must now direct our readers' attention, namely, the *double refraction* and *polarisation* of light.

95. About the middle of the seventeenth century Dr. Erasmus Bartholinus, a physician at Copenhagen, and the author of several excellent works on geometry, procured, from some of the Danish merchants that frequented Iceland, a crystal stone like a rhombick or rhomboid prism, which, when broken into small pieces, kept the same figure. It was dug out of a very high mountain, not far from the Bay of Roerfiord, in 65° of lat. Its whole body was rather clear than bright, and of the color of limpid water; but that color, when it was immersed in water and dried again, became dull. With this substance, which from its locality was called Iceland crystal, Bartholinus made a number of experiments both chemical and optical; and, having discovered some of the singular effects which it produced upon light, he published an account of them at Copenhagen in 1669, under the title of *Experimenta Crystalli Islandici Dis-diaclastici, quibus mira et insolita refractio detegitur*. There does not appear to be a copy of this work in this country, but the want of it is well supplied by an account of sundry experiments made and communicated by Dr. Erasmus Bartholinus, addressed to Dr. Oldenburgh, and printed in the sixty-seventh number of the Philosophical Transactions. From this account we shall select those parts which relate to double

refraction, and shall in general give them in the words of the author.

96. (1.) 'The objects seen through this crystalline prism appear sometimes, and in certain positions of the prism, double; where it is to be noted, that the distance between the two images is greater or less, according to the different bigness of the prism; insomuch that in thinner pieces this difference of the double image almost vanisheth.

97. (2.) 'The object appearing double, both images appear with a fainter color; and sometimes one part of the same species is obscurer than the other.

98. (3.) 'To an attentive eye one of these images will appear higher than the other.

99. (4.) 'In a certain position the image of an object seen through this body appears but single, like as through any other transparent body.

100. (5.) 'We have also found a position wherein the object appears six-fold.

101. (6.) 'If any of the obtuse angles of this prism be divided into two equal parts by a line, and the visual rays do pass from the eye to the object through that line or its parallel, both images will meet in that line, or in another parallel to it.

102. (7.) 'Whereas objects seen through diaphanous bodies are wont to remain constantly in the same place, in what manner soever the transparent body be moved, nor the image on the surface move, except the body be moved; we have observed here that one of the images is moveable, the other remaining fixed; although there be a way also to make the fixed image moveable, and the moveable fixed in the same crystal, and another to make both moveable.

103. (8.) 'The moveable image doth not move at random, but always about the fixed, which while it turneth about, it never describeth a perfect circle but in one case.

104. (9.) 'Dioptrics teach, that a diaphanous body having one only surface, sends from one object but one image refracted to the eye, and, having more surfaces than one, it represents one image in each. But, whereas in our substance there occurs but one plain superficies to the eye, and yet a double image of one object, it concerned us to consider whence this double image might be caused. Two ways offered themselves to us, reflection and refraction. How reflection could perform it, was difficult to find. For, having dulled the clearness of the two plain sides of our crystalline prism, thereby to make them unfit for reflecting the light, the rays being directed through its upper and lowermost superficies, the image still appeared double. Again, two species appearing through a great prism, upon breaking of the same into pieces, and so reducing it into divers smaller ones, it came to pass, that through each of these less portions the same object was seen always double. Whence I collected, that if it should be said that one of the images proceeded from the reflection of the plain sides, the former of these experiments would discountenance that assertion. But then if another should derive the cause from some internal reflection of the surfaces of this

body, certainly the same effect would not have been found in every one of its parts; but the double appearance that was exhibited in the smallest portion would have been multiplied in a greater bulk.

105. 'Reflection, therefore, not satisfying, we recurred to refraction. But whereas it is known that no image can pass through two diaphanous bodies of a different nature but by refraction, and that one image supposeth one refraction, it did follow that, if refraction were made the cause of this phenomenon, there would be a double refraction for a double image. And forasmuch as the appearances of our Iceland crystal are not of the same kind, but one of them is fixed, the other moveth, we shall distinguish the refractions themselves which refract the double rays arriving to the eye, and call the one which sends the fixed image refracted to our sight, usual; the other, which transmits the moveable to the eye, unusual. And hence, namely, from this peculiar and notable property of the double refraction in this Iceland-stone, we have not scrupled to call it *disdiaclastic*.

106. 'This being supposed, it will not be irrational to suspect that these two refractions proceed from different principles. For, since it is commonly known from dioptrics that an object, by visual rays affecting the eye, exhibits some image on the superficies of the diaphanous bodies, which image is but one as long as the superficies is one, and the upper plain parallel to the lower; as also, that if, the eye remaining steady, the diaphanous body be moved, that image remains always fixed, as long as the object whence it comes remains unmoved; therefore, in this transparent substance, the image which appears fixed may proceed according to the ordinary laws of usual refraction; but that which moveth, and is carried about according to the motion of the diaphanous body, while the object remains unstirred, sheweth an unusual kind of refraction, hitherto unobserved by dioptricians.

107. 'Hence, that I might examine the nature and difference of both, I put upon some object, as the point A, fig. 5, the prism of my double refracting crystal N P R Q T B S, and, the eye M being perpendicularly posited over the upper plain of the prism N P R Q, I noted whether there was any refraction of the point A, for the usual laws of refraction teach that there is none. But the perpendicular ray of the eye was observed to pass not through the moveable but the fixed image, thereby being conformable to the rules of usual refraction, as striking the eye unrefracted, so that the eye, the image, and the object, were seen in the same line. But when in the same site of the eye, the object A did also exhibit the other image X, at no small distance from the former, I took notice that this object A was not seen unrefracted by the means of the image X, though the eye M remained perpendicular over the plain; and that, consequently, this unusual refraction is not subject to the received axiom of dioptrics, which imports that a ray, falling perpendicularly on the superficies of a diaphanous body, is not refracted, but passeth unrefracted.

108. 'Next I so placed the eye in O that the

ray from the object A arriving to the eye, might be parallel to the lines RT and QB of the plane RQT B, &c.; then it appeared that the rays were trajected from the object A without refraction, through the moveable image Q; the object A, the moveable image Z, and the eye O, being in the same line; and that the same object A did transmit to the eye O, remaining in the same position, yet another species Y, through the refracted ray AYO. Whence it was manifest to me that this unusual refraction had for its rule the parallel of the sides of this double refracting crystal, while the usual refraction was directed according to the perpendicular of the superficies.

109. 'But considering that the place of the point appearing through our diaphanous body cannot easily be determined, as being only obvious in the uppermost part, we shall add the way whereby we have found its diversity, by drawing on the subjacent table a straight line through that point; the place of which line will be determined by the one eye through this crystal, and by the other eye without the crystal. For, in the same figure, let through the object A be drawn upon the table a straight line BC. The eye being in M, that double line HD and IE will appear, the species being cast on the upper surface; and, if you will attend well, you will observe one of the images, viz. the fixed HD, to be congruent to the adjacent line BC, whilst the other, namely, the moveable EI, tendeth towards R. But if afterwards the eye be posited in O, the same object, I mean the line BC, will not only be represented double by the images KF and LG, but also the moveable image GL be congruent to the inferior line BC, while the fixed FK is not so, but tends towards N.'

110. After describing these experiments, Bartholinus proceeds to measure the ratio of the angles of incidence and refraction in the ordinary image, and he finds it to be as five to three, which makes the index of refraction 1.667. He endeavours to account for the double refraction, by supposing that the Iceland crystal has two sets of pores; one, according to the ductus or direction of the sides, and parallel thereto; since it may be observed that, 'according to this disposition of the sides, it is broken, and the parts severed from one another, and that one of the images, namely the moveable, passeth through them. Next, besides these pores lying according to the parallelism of the sides, it has others, such as glass, water, and right crystals have, through which the right image is transmitted.'

111. Bartholinus next supposes that there are some directions in which the rays pass through the crystal unrefracted; and though, in ordinary diaphanous bodies, these directions are perpendicular to their surfaces, yet in other bodies they may have another position. He likewise supposes that half of the incident pencil is refracted usually, and the other half unusually; or, what is the same thing, that the usual and unusual refractions have the same power to refract the incident light.

112. From this account of Bartholinus's experiments, he appears to have discovered three important facts.

113. (1.) That Iceland spar has the property of double refraction.

114. (2.) That one of these refractions is performed according to a law which is common to all transparent solids and fluids, while the other is performed according to an extraordinary law which had not previously been observed by philosophers; and,

115. (3.) That the incident light is equally divided between the ordinary and extraordinary pencils.

116. Bartholinus does not seem to have transmitted the ordinary and extraordinary pencils through a second piece of Iceland spar, and it was therefore reserved for the celebrated Huygens to discover, by means of this experiment, the remarkable properties which arise from the polarisation of these two pencils.

117. A few years after the publication of Bartholinus's work on Iceland crystal, the attention of Huygens was directed to the subject of double refraction. He was induced to begin this investigation principally with the view of obviating any objection that might be drawn from the facts discovered by Bartholinus, against his own theory of ordinary refraction; and he was led to the particular views which he has published from a desire to assimilate the two classes of phenomena.

118. His researches on the subject from the fifth chapter of his *Traité de la Lumière*, which is entitled *De l'Estrange Refraction du Cristal d'Islande*. This work was composed about the year 1678, and read to several of the learned individuals who then composed the Academy of Sciences; but it was not published till the year 1690, when its author was resident in Holland.

119. After a few preliminary observations, in which he gives Bartholinus the credit of having discovered some of the principal phenomena, he supposes AB EF, fig. 6, to be a piece of Iceland crystal, and conceiving one of the three obtuse angles, which form the solid angle C, namely, ACB, to be bisected by CG, he calls the plane CGHF, which passes through this line, and the side CF, the principal section of the crystal.

120. If the surface AB is now exposed to the sun, being all covered but a small aperture K in CG, and if a ray IK is incident perpendicularly at K, it will be divided at the point K into two rays, one of which, KL, will be a continuation of IK; while the other, KM, will deviate from KL towards C, by an angle of $6^{\circ} 40'$, but will still be in the plane CGHF. This ray will emerge at M in the direction MZ parallel to IK. Hence, since the point M, by the extraordinary refraction, is seen by the refracted ray MKI, the eye being at I, any point or aperture at I, by the same refraction, will be seen by the refracted ray LKI, LK being parallel to MK, if I is very distant. The point L will consequently be seen in the direction IRS, and, as the same point is seen by the ordinary refraction in the direction IK, it will necessarily appear double.

121. If the ray now falls in the direction NO, in the plane CGHF, making an angle of $73^{\circ} 20'$ with CG, or nearly parallel to CF, which makes with FH an angle of $70^{\circ} 57'$, it will be divided at O into two rays, one of which will be

OPTICS.

a continuation of NO , without refraction, while the other will be refracted in the direction OQ , both rays being in the plane $CGHF$. This is true of all planes parallel to the principal section.

122. In order to determine the law of the two refractions, Huygens drew upon a smooth surface a black line, AB , fig. 7, and two lines CED , KML , perpendicular to it, and having their distance EM greater or less, according to the obliquity at which the refraction is to be examined. The crystal being placed upon E , so that AB is in, or parallel to, the principal section EG , place the eye above it, and the line AB will be seen single, but CD will be double. The ordinary image will be easily distinguished from the extraordinary image, from the latter being always more elevated, or from the former remaining fixed in turning the crystal, while the latter revolves round the ordinary image.

123. If the eye is now placed at I , perpendicular to AB , till it sees the ordinary image of CD coinciding with the part of CD without the crystal, let the point H be marked on the crystal where the intersection at E appears. Let the eye be now taken towards O , in the same perpendicular plane, till the ordinary image of CD coincides with KL , and let the point N , where the intersection E now appears, be marked upon the crystal. The lines NH , EM , and HE , the thickness of the crystal, being accurately measured, then, joining NE and NM , the ratio of refraction will be that of EN to NP , because these lines are as the sines of the angles of incidence and refraction NPH , NEP . In this way Huygens found the ratio to be that of five to three at all incidences, as Bartholinus had previously determined.

124. In order to find the extraordinary refraction, he next withdrew his eye to Q , till the extraordinary image of CD coincided with KL ; he marked the point R , and consequently obtained by measurement the ratio of ER to ES , or the ratio of the sine of incidence to that of refraction. By numerous observations he found that this ratio was not constant, but changed with the inclination of the incident ray.

125. In continuing his observations on the extraordinary refraction, Huygens found that it observed the following law:—Let $CGHF$, fig. 8, be the principal section; and SK , VK , two incident rays equally inclined to the perpendicular IL ; and KT , KX , the extraordinary rays after refraction; the distances TM and XM of these rays from the point M , where the refraction of the perpendicular ray IK cuts the base by F , will always be equal. This law is also true in the refraction of the other sections.

126. Having succeeded in explaining, in a very satisfactory manner, the refraction of ordinary transparent bodies, by means of spherical emanations of light, Huygens was naturally led to suppose that, as Iceland spar had two different refractions, it must also have two different emanations of waves of light, one of which might be propagated in a spherical form in the ethereal matter spread through the crystal. He conceives that this ethereal matter exists in greater quantity than the solid particles, and is alone capable of

producing transparency. From these spherical undulations, which are propagated more slowly within the crystal than without it, proceed the phenomena of the ordinary refraction. The other set of undulations, to which the irregular refraction is owing, he conceives to be elliptical or rather spheroidal, and to be propagated indifferently both through the ethereal matter and through the solid particles. Huygens considers that the regular arrangement of the particles may contribute to the formation of the spheroidal waves, as nothing more is required for this than that the light be propagated more quickly in one direction than another; and he was convinced that such an arrangement actually exists in Iceland spar.

127. In proceeding to explain his theory, Huygens supposes AB , fig. 1, plate II., to be the surface of Iceland spar, exposed to a beam of light; and as a perpendicular ray incident upon this surface from a distant luminous is, by the theory of undulation, no more than the incidence of a parcel of waves parallel to AB , he considers the line BC , parallel and equal to AB , to be a portion of the wave of light, of which the points R , H , A , C , meet AB at A , K , k , B . Instead of hemispherical waves, as in ordinary refractions, he supposes the waves to be now hemispheroids, whose major semi-axes are oblique to the plane AB . Hence SVI will represent an individual wave coming from the point A , after RC has arrived at AB . Now, as all the other points K , k , B , will propagate waves similar to SVI , in the same space of time that the point A did, the common tangent NQ of all these semi-ellipses will be the propagation of the wave RC in the transparent body, according to the above theory:

128. But the tangent NQ , which is equal and parallel to AB , is not directly opposite to A , B , but comprehended between AN and BQ , conjugate diameters to those which are in the line AB . 'In this way,' says Huygens, 'I have been able to conceive what appeared very difficult, how a perpendicular ray could suffer refraction in a transparent body,' the wave RC , instead of going straight on when it entered the surface AC , extending itself between the parallels AB and NQ .

129. In order to determine the form and situation of the spheroids in Iceland crystal, Huygens considered that all the six faces produced the same refraction, which were equally related to the principal sections shown in fig. 2, by dotted lines drawn from C . Hence he concluded that the spheroid which had the same relation to these three sections must have its axis coincident with the axis of the solid angle C , and therefore that the short diagonal of the rhomb determined the position of the axes of all the spheroidal waves, propagated from any point, taken either within or at the surface of the crystal, since all the spheroids ought to be similar, and have their axes parallel.

130. In the section GCF the angle C is $109^\circ 3'$, and the angle F $70^\circ 57'$; and if we conceive a spheroidal wave round the centre C , its axis will be in the same plane. Let CS , fig. 3, be the half of this axis, then the angle GCS

will be found to be $45^\circ 20'$. In determining the form of the spheroid, or the ratio of the semi-diameters CS , CP , which are perpendicular to each other, Huygens considers that the point M , where FH , parallel to CG , touches the ellipse, must be so situated that CM makes an angle of $6^\circ 40'$ with the perpendicular CL , being the deviation of the extraordinary ray. Hence we shall have,

$$\begin{aligned} CM &= 100000 \\ CP &= 105032 \\ CS &= 93410 \\ CG &= 98779 \end{aligned}$$

and the ratio of CP to CS that of 9 to 8; the spheroid is therefore produced by the revolution of an ellipse round its smaller diameter.

131. In order to determine the refraction of oblique rays, Huygens saw that they depended on the proportion between the velocity without and within the crystal; and he supposes this proportion to be such that while the light in the crystal describes the spheroid GSP , fig. 4, it describes without it a sphere whose semi-diameter is equal to the line N , which will be afterwards determined. Now, if RC is a ray incident at the surface CK , draw CO perpendicular to RC , and from O draw OK equal to N , and at right angles to CO . Having then drawn KI , touching the ellipse GSP , the line IC will be the refracted ray required. For the refraction of RC is nothing else than the progress of the point C of the curve CO , continued in the crystal; but the points HH of this wave, during the time that O comes to K , will arrive at the surface CK by the lines Hx , &c., and will also have produced in the crystal particular hemispheroidal waves from the centres x , &c., similarly situated with the hemispheroid $GSPg$; and whose great and small diameters will have the same ratio to the lines xv (which are continuations of Hx to KB parallel to CO) as the diameters of the spheroid GSP have to the line CB or N . The common tangent, therefore, of all the spheroids, which are here represented by ellipses, will be the line IK , which will be the propagation of the wave CO ; and the point I that of C .

132. In order to find the point of contact, I , we must find a third proportional CD to the lines CK , CG ; and having drawn DI parallel to CM , the diameter conjugate to CG , and previously determined, we have only to draw HI , which will touch the ellipse at I .

133. In like manner we may find the refracted ray Ci of any other ray rC , incident on the opposite side, by drawing Co perpendicular to Cr and following the rest of the preceding construction.

134. Hence we see that, if Cr and CR are incident at equal angles, we shall have $Cd = CD$, since $Ck = CK$ and $Cg = CG$. Consequently Ii will be bisected in E by CM , to which DI , Di , are parallel; and, because CM is the conjugate diameter to CG , it follows that Ii will be parallel to gG . If we then prolong the refracted rays, CI , Ci , till they meet the tangent ML in T and t , the distances MT , Mt , will also be equal.

135. Huygens next found, by measuring the

irregular refraction, that the ratio of N to CG was that of 156962 to 98779, or of 8 to 5 $\frac{1}{2}$, and he proceeds to explain an abridged method of finding the irregular refraction.

136. Let gG , fig. 5, be the surface of the crystal, GPG the ellipse, and CM the refraction of the perpendicular ray FC which deviates $6^\circ 40'$, and let RC be any other ray, whose refraction is required.

137. From the centre C , and with the semi-diameter CG , describe the circumference gRG , cutting the ray RC in R , and let fall RV perpendicular to CG . Then, since CD is known from the analogy, $N : CG = CV : CD$; draw DI parallel to CM , cutting the ellipse gMG in I , and joining C and I , CI will be the refracted ray required. For let CO be perpendicular to CR , and OK drawn equal to N , and perpendicular to CO ; then, if KI touches the ellipse in I , CI must be the refraction of RC . Since RCO is a right angle, the right-angled triangles RCV , KCO , are similar. Hence $CK : KO = RC : CV$; but $KO = N$, and $RC = CG$;

Whence $CK : N = CG : CV$; but by construction,

$$N : CG = CV : CD; \text{ therefore,}$$

$$CK : CG = CG : CD;$$

and, because DI is parallel to CM , the diameter conjugate to CD , it follows that KI touches the ellipse in I .

138. It appears, therefore, that, as there is in ordinary refractions, a constant ratio between the sines of incidence and refraction, so in the present case there is such a proportion between CV and CD or IE , that is between the sine of the angle of incidence, and the line intercepted between the refracted ray and the diameter CM ; for the ratio of CV to CD is always the same as that of N to the semi-diameter CG .

139. In comparing the regular and irregular refraction, Huygens observes, that if $APBS$, fig. 6, is the spheroid by which the light propagates itself in the crystal in a certain space of time, and produces the irregular refraction, then the inscribed sphere $BVST$ is the propagation, in the same space of time, of the light which serves for the regular refraction. For, since N is the radius of a spherical wave of light in the air, while in the crystal it is propagated by the spheroid $APBS$, the ratio of N to CS is that of 156962 to 93410. But the ratio of the regular refraction is that of 5 to 3, that is, N being the radius of a spherical wave of light in air, its propagation in the crystal forms in the same time a sphere whose radius is to N as 3 to 5. But 156962 is to 93410 as 51.3 minus $\frac{1}{4}$.

140. Though there are two different propagations of light within the crystal, yet it is only in the direction of the perpendiculars to the axis BS of the spheroid, that one of these propagations is more rapid than the other, for they have the same velocity in another direction, namely, in that of lines parallel to the same axis BS , which is also the axis of the obtuse angle of the crystal.

141. The ratios of the refractions being such as have now been determined, it follows that a ray of light, RC fig. 7, incident at an angle of

$73^{\circ} 30'$ with CG , should have its refraction CI in the same straight line with RC , or should pass through the crystal without refraction. For since $CG = CR = 98779$; $CM = 100000$ and $RCV = 73^{\circ} 20'$, CV will be 28330. But, because CI is the refraction of RC , $CV : CD = 156962 : 98779 = N : CG$, and $CD = 17828$. And since $CG^2 = CM^2 = GD \times Dg$: DP we have $DI : CE = 98353$. But as $CE : EI = CM : MT$; $MT = 18127$, which being added to $ML = 11609$ (the sine of $LCM = 6^{\circ} - 40'$) we have $LT = 27936$, which is to $LC = 99324$ as CV is to VR , that is as 29938, the cotangent of RCV , is to the radius. Whence it appears that $RCIT$ is a straight line.

142. Huygens goes on to show that the ray CI , emerging at the opposite surface of the crystal, ought to pass straight on without refraction, by demonstrating in general, that the reciproca-tion of refractions takes place in this crystal as well as with transparent bodies; that is, if a ray RC , fig. 8, incident on the surface of the crystal CG , is refracted in CI , the ray CI , emerging at the opposite and parallel surface IB of the crystal, will have its refraction IA , parallel to the ray RC .

143. Let CO , perpendicular to CR , represent, as formerly, a portion of a wave, whose continuation in the crystal is IK , so that the point C is continued by CI during the time that O arrives in K . If we now take a second space of time equal to the first, the point K of the wave IK will, in this second portion of time, have moved through the right line KB , equal and parallel to CI , because every point of the wave CO , in arriving at the surface CK , ought to continue in the crystal the same as the point C , and in the same time it will propagate from the point I in the air a spherical wave having a semi-diameter $IA = KO$, since KO is described in the same time. If we consider any other point k of the wave IK , it will advance by Am parallel to CI , and reach the surface IB , while the point K describes $Kl = Am$, and during the time that K has completed the remainder, lB , there will have been propagated from the point m a spherical wave, whose semi-diameter mn will have the same ratio to lB as $IA : KB$. The waves mn and IA will therefore have the same tangent AB , and the same is true of all the other spherical waves that are propagated out of the crystal by the impulsion of all the points of the wave IK against the surface of the other IB . The tangent BA will therefore be the continuation of the wave IK out of the crystal, when the point K has come to B ; and consequently IA , which is the perpendicular to BA , will be the refraction of the ray CI in going out of the crystal. But IA is parallel to RC since $IB = CK$, and $IA = KO$ and A and O right angles.

144. The only observations which Sir Isaac Newton appears to have published, on the subject of double refraction and polarisation, are contained in the queries printed at the end of the Third Book of his Optics. As they are written with great perspicuity, and easily understood, we shall lay them before our readers in his own words.

145. 'Query 25. Are there not other original

properties of the rays of light, besides those already described? An instance of another original property we have in the refraction of Iceland crystal, described first by Erasmus Bartholine, and afterwards more exactly by Huygenius, in his book *De la Lumiere*. This crystal is a pellucid fossile stone, clear as water or crystal of the rock, and without color; enduring a red heat without losing its transparency, and in a very strong heat calcining without fusion. Steeped a day or two in water it loses its natural polish. Being rubbed on cloth it attracts pieces of straws and other light things, like amber or glass; and with aquafortis it makes an ebullition. It seems to be a sort of talc, and is found in form of an oblique parallelopped, with six parallelogram sides and eight solid angles. The obtuse angles of the parallelograms are each of them $101^{\circ} 52'$; the acute ones $78^{\circ} 8'$. Two of the solid angles opposite to one another, as C and E , fig. 9, are compassed each of them with three of these obtuse angles, and each of the other six with one obtuse and two acute ones. It cleaves easily in planes parallel to any of its sides; and not in any other planes. It cleaves with a glossy polished surface not perfectly plane, but with some little unevenness. It is easily scratched, and by means of its softness it takes a polish very difficultly. It polishes better upon polished looking glass than upon metal, and perhaps better upon pitch, leather, or parchment. Afterwards it must be rubbed with a little oil or white of an egg, to fill up its scratches; whereby it will become very transparent and polished. But for several experiments it is not necessary to polish it. If a piece of this crystalline stone be laid upon a book, every letter of the book seen through it will appear double, by means of a double refraction. And if any beam of light falls either perpendicularly, or in any oblique handle upon any surface of this crystal, it becomes divided into two beams, by means of the same double refraction. Which beams are of the same color with the incident beam of light, and seem equal to one another in the quantity of their light, or very nearly equal. One of these refractions is performed by the usual rule of optics, the sine of incidence out of air into this crystal, being, to the sine of refraction as five to three. The other refraction, which may be called the unusual refraction, is performed by the following rule.

146. 'Let $ADBC$ represent the refracting surface of the crystal, C the biggest solid angle at that surface, $GEHF$ the opposite surface, and CK a perpendicular on that surface. This perpendicular makes, with the edge of the crystal CF , an angle of $19^{\circ} 3'$. Join KF , and in it take KL , so that the angle KCL be $6^{\circ} 40'$, and the angle LCF $12^{\circ} 23'$. And, if ST represent any beam of light incident at T in any angle upon the refracting surface $ADBC$, let TV be the refracted beam determined by the given proportion of the sines five to three, according to the usual rule of optics, Draw VX parallel and equal to KL . Draw it the same way from V in which L lieth from K ; and, joining TX , this line TX shall be the other refracted beam carried from T to X , by the unusual refraction.

147. 'If, therefore, the incident beam ST be

perpendicular to the refracting surface, the two beams T V and T X, into which it shall become divided, shall be parallel to the lines C K and C L; one of these beams going through the crystal perpendicularly, as it ought to do by the usual laws of optics, and the other T X by an unusual refraction diverging from the perpendicular, and making with it an angle V T X of about 68° , as is found by experience. And hence the plane V T X, and such like planes which are parallel to the plane C F K, may be called the planes of perpendicular refraction. And the coast towards which the lines K L and V X are drawn, may be called the coast of an unusual refraction.

148. 'In like manner crystal of the rock has a double refraction: but the differences of the two refractions is not so great and manifest as in Iceland crystal.

149. 'When the beam S T, incident on Iceland crystal, is divided into two beams T V and T X, and these two beams arrive at the farther surface of the glass; the beam T V, which was refracted at the first surface after the usual manner, shall be again refracted entirely after the usual manner at the second surface; and the beam T X, which was refracted after the unusual manner in the first surface, shall be again refracted entirely after the unusual manner in the second surface; so that both these beams shall emerge out of the second surface in lines parallel to the first incident beam S T.

150. 'And if two pieces of Iceland crystal be placed one after another, in such a manner that all the surfaces of the latter be parallel to all the corresponding surfaces of the former, the rays which are refracted after the usual manner in the first surface of the first crystal shall be refracted after the usual manner in all the following surfaces, and the rays which are refracted after the unusual manner in the first surface, shall be refracted after the unusual manner in all the following surfaces. And the same thing happens though the surfaces of the crystal be any ways inclined to one another, provided that their planes of perpendicular refraction be parallel to one another.

151. 'And, therefore, there is an original difference in the rays of light, by means of which some rays are, in this experiment, constantly refracted after the usual manner, and others constantly after the unusual manner. For if the difference be not original, but arises from new modifications impressed on the rays at their first refraction, it would be altered by new modifications in the three following refractions; whereas it suffers no alteration, but is constant, and has the same effect upon the rays in all the refractions. The unusual refraction is, therefore, performed by an original property of the rays. And it remains to be enquired, whether the rays have not more original properties than are yet discovered?

152. 'Query 26. Have not the rays of light several sides, endued with original properties? For, if the planes of perpendicular refraction of the second crystal be at right angles with the planes of perpendicular refraction of the crystal, the rays which are refracted after the usual manner in passing through the first crystal will be

all of them refracted after the usual manner in passing through the second crystal, and the rays which are refracted after the unusual manner in passing through the first crystal will all of them be refracted after the usual manner in passing through the second crystal. And, therefore, there are not two sorts of rays differing in their nature from one another, one of which is constantly and in all positions refracted after the usual manner, and the other constantly and in all positions after the unusual manner. The difference between the two sorts of rays, in the experiment mentioned in the twenty-fifth question, was only in the positions of the sides of the rays to the planes of perpendicular refraction. For one and the same ray is here refracted sometimes after the usual, and sometimes after the unusual manner, according to the position which its sides have to the crystals. If the sides of the ray are posited the same way to both crystals, it is refracted after the same manner in them both. But, if that side of the ray which looks towards the coast of the unusual refraction of the first crystal be 90° from that side of the same ray which looks towards the coast of the unusual refraction of the second crystal (which may be effected by varying the position of the second crystal to the first, and by consequence to the rays of light), the ray shall be refracted after several manners in the several crystals. There is nothing more required to determine whether the rays of light which fall upon the second crystal shall be refracted after the usual, or after the unusual manner, but to turn about this crystal, so that the coast of this crystal's unusual refraction may be on this or on that side of the ray. And, therefore, every ray may be considered as having four sides or quarters; two of which, opposite to one another, incline the ray to be refracted after the unusual manner, as often as either of them are turned towards the coast of unusual refraction, and the other two, whenever either of them are turned towards the coast of unusual refraction, do not incline it to be otherwise refracted than after the usual manner. The two first may, therefore, be called the sides of unusual refraction. And since these dispositions were in the rays before their incidence on the second, third, and fourth surfaces of the two crystals, and suffered no alteration (so far as appears) by the refraction of the rays in their passage through those surfaces, and the rays were refracted by the same laws in all the four surfaces: it appears that those dispositions were in the rays originally, and suffered no alteration by the first refraction, and that by means of those dispositions the rays were refracted at their incidence on the first surface of the first crystal, some of them after the usual, and some of them after the unusual manner, according as their sides of unusual refraction were then turned towards the coast of the unusual refraction from that crystal or sideways from it.

153. 'Every ray of light has, therefore, two opposite sides, originally endued with a property on which the unusual refraction depends, and the other two opposite sides not endued with that property. And it remains to be enquired, whether there are not more properties of light by

which the sides of the rays differ, and are distinguished from one another.

154. 'In explaining the difference of the sides of the rays above mentioned, I have supposed that the rays fall perpendicularly on the first crystal. But, if they fall obliquely on it, the success is the same. Those rays which are refracted after the usual manner in the first crystal will be refracted after the unusual manner in the second crystal, supposing the planes of perpendicular refraction to be at right angles with one another, as above, and on the contrary.

155. 'If the planes of the perpendicular refraction of the two crystals be neither parallel nor perpendicular to one another, but contain an acute angle, the two beams of light which emerge out of the first crystal will be each of them divided into two more at their incidence on the second crystal. For in this case the rays in each of the two beams will some of them have their sides of unusual refraction, and some of them their other sides turned towards the coast of the unusual refraction of the second crystal.

156. 'To explain the unusual refraction of Iceland crystal by pressure or motion propagated, has not hitherto been attempted (to my knowledge) except by Huygens, who, for that end, supposed two several vibrating mediums within that crystal. But when he tried the refractions in two successive pieces of that crystal, and found them such as is mentioned above, he confessed himself at a loss for explaining them. For pressures or motions, propagated from a shining body through a uniform medium, must be on all sides alike; whereas by those experiments it appears, that the rays of light have different properties in their different sides. He suspected that the pulses of ether, in passing through the first crystal, might receive certain new modifications, which might determine them to be propagated in this or that medium within the second crystal, according to the position of that crystal. But what modifications those might be he could not say, nor think of any thing satisfactory on that point. And if he had known that the unusual refraction depends, not on new modifications, but on the original and unchangeable dispositions of the rays, he would have found it as difficult to explain how those dispositions which he supposed to be impressed on the rays by the first crystal could be in them before their incidence on that crystal; and, in general, how all rays emitted by shining bodies can have those dispositions in them from the beginning. To me, at least, this seems inexplicable, if light be nothing else than pressure or motion propagated through ether.'

157. Those who have already examined the law of double refraction, as given by Huygens, and its agreement with observations made in all sections of the crystals of Iceland-spar, must experience no small degree of surprize, when they find that Sir Isaac Newton has proposed another law, different from his, and absolutely incompatible with observation. As Sir Isaac remarks that Huygens has described the phenomena more exactly than Bartholinus, there is reason to believe that he made some experiments

on the subject, which confirmed those of Huygens; and yet it is strange that, without assigning any reasons he should reject Huygens's law, and substitute another, entirely inconsistent with the very experiments he has praised. In his speculations respecting the cause of the disappearance and reappearance of the pencil, when light is transmitted through two rhombs of calcareous spar, Newton has been more fortunate; and he has undoubtedly the merit of having first suggested the idea of the polarity of light, and of having described the phenomena of the polarisation of the pencils in Iceland-spar, to original properties possessed by different sides of the rays.

158. A paper entitled *An Account of the Double Refractions in Crystals*, by Father John Beccaria, professor of experimental philosophy at Turin, was read before the Royal Society of London on the 18th of March 1762, and printed in the *Transactions* for that year, vol. lii, p. 486. The principal result of these experiments is, that the double refraction in rock crystal is greatest when the ray is perpendicular to the axis of the crystal, and that the images approached to coincidence as the ray approached to that axis. This conclusion must be considered as of some importance, as it overturns the peculiar law of double refraction, which Huygens had devised for rock crystal alone. According to this law, the double refraction of rock crystal should be the same in every direction; whereas Beccaria has proved that it diminishes as the ray approaches to the axis.

159. Beccaria's paper is concluded with some unimportant queries, in one of which he conjectures that the examination of the double refraction of different crystals may lead to the determination of their structure, and mode of formation.

160. Towards the end of the last century the abbé Haüy began to direct his attention to the kindred subjects of crystallography and mineralogy, and to lay the foundation of that beautiful system which has immortalised his name.

161. Not content with the external examination of mineral bodies, he directed his notice to all their physical properties, and thus availed himself of the lights of natural philosophy, in giving a scientific form to the science of minerals.

162. In accomplishing this great event, he was naturally led not only to observe the double refraction of minerals, but to employ it as an essential character in his descriptions; and it was from this cause, more than from any other, that the attention of philosophers was recalled to a subject which had almost disappeared from modern physics.

163. The following are the general views given by this eminent author in his *Traité de Minéralogie*, vol. i. p. 230, which appeared in the year 1801.

164. 'The quantity of double refraction,' says he, 'or, what is the same thing, the magnitude of the angle formed by the two rays, by means of which the eye sees the two images, varies from one substance to another, all other things being similar, according to the nature of the sub-

stances themselves. In zircon, for example, the double refraction is very strong, while it is much less sensible in emerald. Besides, this quantity varies in each substance from different causes. In general it increases or diminishes with the refracting angle, or that which is formed by the two faces through which we look at the object. But there is another cause of variation, which combines itself with the preceding, and which depends on the position of the refracting surfaces, relative to the faces of the primitive form; and such is the influence of this cause that with two equal refracting angles, differently situated, we may have distances perceptibly unequal between the images of the same object, and there is even a limit where the effect of double refraction becomes nothing, that is, when the two images are combined into one.

165. 'This limit takes place in quartz and in emerald where one of the faces containing the refracting angle is perpendicular to the axis. It takes place in sulphate of barytes when one of the same faces, being parallel to the axis is at the same time parallel to a plane passing through the long diagonals of the base of its primitive form.

166. 'On this subject I possess only a small number of observations; but it is probable that all the substances which have double refraction are included in one or other of the two preceding cases, which give the limits of all the positions that the refracting surfaces can have, relative to the primitive form. But, as the position parallel to the axis is variable in its turn, between several limits which correspond to the diagonals and to the sides of the base of the primitive form, it is necessary to know which of these last limits is that which belongs to each substance.

167. 'I shall show, under the article Emerald, how a mistake conducted me to these results; and I confess that there remains still an uncertainty respecting the refraction of some substances, as I have not had leisure to multiply my researches sufficiently, in order to ascertain if a crystal, which gives only a single image of objects, would produce two after being cut in a particular manner.

168. 'Another observation, which will be of some use in generalising the theory of these phenomena, consists in this, that all the substances whose integrant molecule is remarkable by its symmetry have single refraction. Such are those which have for their primitive form the cube, the regular octahedron, and the rhomboidal dodecahedron.

169. 'Experiments on this object have hitherto been made only on those bodies which are called stones. I have extended these experiments to several called salts, and also to inflammable substances, and to metallic substances, oxidated and united to other substances, and I have found that there is no class of minerals which does not present bodies endowed with double refraction.'

170. After mentioning the methods which he employed for observing the double refraction, but which are entirely superseded by methods equally simple and much more certain, our author remarks, 'That it would be difficult to

find a character more prominent than that which is drawn from double refraction, since it belongs to the very essence of the minerals in which it exists; and that it is fortunate that we are able, in this way, to supply the disappearance of crystalline forms by a physical observation, and thus to read in a certain degree in the interior of the stone, when its exterior no longer speaks to the eye.'

171. The following is the list of substances which have double refraction, as given by the abbé Haiüy:—

Haiüy's Table of Doubly Refracting Crystals.

1. Carbonate of lime strong.
2. Sulphate of lime.
3. Sulphate of barytes.
4. Sulphate of strontian.
5. Borate of soda.
6. Quartz.
7. Zircon, very strong.
8. Cymophane.
9. Topaz.
10. Emerald.
11. Corundum.
12. Euclase, strong
13. Feldspar.
14. Peridot, strong.
15. Mesotype.
16. Sulphur, strong.
17. Mellite.
18. Carbonate of lead.
19. Sulphate of iron.
20. Arragonite, strong.

Haiüy's Table of Crystals with Single Refraction.

- | | |
|------------------------------|------------------------|
| 1. Fluats of lime. | 6. <i>Amphigene.</i> |
| 2. <i>Phosphate of lime.</i> | 7. <i>Tourmaline.</i> |
| 3. <i>Telesie.</i> | 8. <i>Arinite.</i> |
| 4. Spinelle. | 9. <i>Disthene.</i> |
| 5. Garnet. | 10. Sulphuret of zinc. |

172. In his article on the Double Refraction of Iceland Spar, Haiüy gives a detailed account of various experiments, that possess no very particular interest. He demonstrates by experiment the error of Newton's law, which we have already mentioned. He establishes the truth of the Huygenian law; but erroneously remarks, that it accords with observations only within certain limits, and he adopts the physical hypothesis of Newton, that the particles of light have two kinds of poles, on which the Iceland spar exerts a particular action, whose centre is placed in the region of the small solid angle of the crystal.

173. The only observations which we have to offer on the preceding articles, relate to the remark, that the cubical octahedral, and rhomboido-dodecahedral crystals have single refraction. The only meaning which can be attached to this remark is, that some of these bodies have single refraction; for, out of the ten crystals which Haiüy gives as having only single refraction, there are no fewer than six which belong to none of the above primitive forms, viz. those marked in italics.

174. The absolute incompatibility of Haiüy's conclusions with his own facts, will appear still more strikingly from his list of transparent crys-

als, which have the cube for their primitive form, viz.

| | |
|-------------------|---------------------------|

| Muriate of soda. | <i>Scheelin calcaire.</i> |
| <i>Amphigene.</i> | <i>Oxide of tin.</i> |

every one of which, with the single exception of muriate of soda, has double refraction.

175. Believing, therefore, that all these five crystals had no double refraction, when they actually possessed it, Haüy deduced the conclusion that all cubical crystals had single refraction, whereas this property belonged only to one out of six. The conclusion, however, is still true, and has been established by more numerous and recent observations, both optical and crystallographical. *Boracite* belongs to the rhomboidal system of crystallisation; *scheelin calcaire*, and *oxide of tin*, to the pyramidal system; *amphigene* to the prismatic system; and *analcime* to the composite system. Muriate of soda, therefore, is the only crystal left among the cubical forms to authorise the deduction of our author.

176. In the Bakerian lecture for 1801, our learned and ingenious countryman, Dr. Thomas Young, pointed out the advantages of the Huygenian theory of light, in affording an explanation of several phenomena which had not been accounted for by any other hypothesis. Dr. Wollaston, who had invented a new method of measuring the refractive powers of bodies, conceived the idea of employing this method to examine the accuracy of Huygens's theory of double refraction. Huygens had himself done this by direct experiment; but it was desirable to have the same examination repeated by a philosopher of Dr. Wollaston's accuracy, and by a method which promised to afford very nice results. In this way Dr. Wollaston obtained the following results:—

| | Index of refraction. |
|--|----------------------|
| 1. When the line of sight bisects an acute angle of a natural surface of the spar | 1.488 |
| 2. When the plane of incidence is parallel to one of the sides | 1.518 |
| 3. In a direction at right angles with either side | 1.537 |
| 4. In the plane bisecting an obtuse angle | 1.571 |
| 5. On a surface perpendicular to the axis of the rhomb | 1.488 |
| 6. The regular refraction found by the ordinary method, from an average of several experiments | 1.657 |
| 7. The inclination of two surfaces | 105° 8' |
| 8. Inclination of a refracted perpendicular ray to the perpendicular | 6° 16' |

Having obtained these results, Dr. Wollaston then contrasts them with those calculated by Haüy.

| Exp. | Observed. | Calculated. |
|----------------|-----------|-------------|
| 2 | 1.518 | 1.5215 |
| 3 | 1.537 | 1.539 |
| 4 | 1.571 | 1.5736 |
| Observed angle | 6° 16' | 6° 7½' |

177. Dr. Wollaston considers the result of this comparison as highly favorable to the Huygenian theory; and he adds that though the existence of two refractions at the same time, and in the same substance, be not well accounted for, and still less their interchange with each other, when a ray of light is made to pass through a second piece of spar, situated transversely to the first; yet the oblique refraction, when considered alone, seems nearly as well explained as any other optical phenomenon.

178. The attention of the illustrious La Place was no doubt directed to the subject of double refraction by the labors of Dr. Young and Dr. Wollaston, who had drawn the attention of the scientific world to this recondite branch of physical science.

179. These investigations are contained in a memoir, entitled *Sur les Mouvements de la Lumière dans les Milieux Diaphanes*, which was read at the Institute on the 30th of January, 1808, and published in their *Memoirs* for 1809, p. 300—342.

180. It occurred to M. La Place that it would be highly interesting to refer the law of Huygens to attractive and repulsive forces, as Newton had done the ordinary refraction. In employing the principle of least action for this purpose, he remarks that, in the case of the extraordinary refraction, the velocity of the light within the crystal must be independent of the manner in which it enters, and must depend only on the position of the ray with respect to the axis of the crystal, that is, on the angle which the ray forms with a line parallel to the axis.

181. In setting out from this datum, M. de La Place arrives at two differential equations given by the principle of least action, and in which the interior velocity is an indeterminate function of the angle, which the refracted ray forms with the axis of the crystal. In the first case which he examines, the square of the velocity of the ray is increased in the interior of the medium by a constant quantity (which is the case of ordinary transparent mediums), and this constant quantity expresses the action of the medium upon light. The two equations, then, show that the incident and refracted ray are in the same plane, and that the ratio of the sines of their inclination to a vertical line is constant.

182. In the next case the action of the medium upon light is equal to a constant quantity, plus, a term proportional to the square of the cosine of the angle which the refracted ray forms with the axis; for as this action is equal on all sides of the axis, it must depend only on the even powers of the sine and cosine of that angle. The expression of the square of the interior velocity is thus of the same form as that of the action of the medium. By substituting this expression in the differential equation of the principle of least action, M. de La Place then determines the formulæ of refraction in relation to this case, and he finds that they are identically those which are given by the law of Huygens. Hence it follows, that the Huygenian law satisfies both the principle of least action, and the condition that the interior velocity depends only on the angle formed by the axis and the refracted ray.

183. M. de La Place then proceeds to remark, that the hypothesis of Huygens, that the velocity of the ray is expressed by the variable radius of the ellipsoid, does not satisfy the principle of least action, but that it satisfies the principle of Fermat, which consists in this, that the light arrives from a point taken without the crystal, to a point taken within it, in the least time possible. For it is obvious that this principle becomes the same as that of least action, by reversing the expression of the velocity. Hence both these principles conduct to the law of refraction discovered by Huygens, provided that, in the principle of Fermat, we assume with Huygens the radius of the ellipsoid as a measure of the velocity, and that, in the principle of least action, we assume this radius as representing the time employed by light in traversing a determinate space taken for unity.

184. The identity of the law of Huygens and the principle of Fermat's results, as M. de La Place has remarked, from the ingenious way in which Huygens considers the propagation of the waves of light, so that his way of considering it, though very hypothetical, represents nevertheless all the laws of refraction which may be due to attractive and repulsive forces, since the principle of Fermat gives the same laws as that of the least action, by reversing the expression of the velocity.

185. It will be evident that, in a work like the present, our space will not admit of further analysis of M. de La Place's Memoir, but merely to remark, that the formulæ which he deduces from the principle of least action, and that of Fermat, are found to be identical with the elegant formulæ which Malus deduced from the construction of Huygens. For a variety of full and interesting particulars, on this curious part of optical science, we must refer our readers to the Journal edited by Dr. Brewster.

186. POLARISED LIGHT.—It has been usual to commence this subject by considering the well known phenomenon of double refraction, a property possessed by all crystals, the primitive form of which is neither the cube nor regular hexahedron. Of all known bodies the Iceland spar, or rhomboidal carbonate of lime, shows the fact with the greatest certainty; and as it is a mineral easily procured, and of sufficient size and transparency, it has been generally made use of. The crystals of this substance have the form of a rhomboid, having six acute solid angles, and two obtuse. These last, x and α , fig. 10, are formed by the junction of three equal plane angles, and equally inclined to each other. The line x , joining these two angles, is therefore similarly situated with respect to the three planes forming each angle, and is called the axis of the crystal. A plane, perpendicular to the natural surface of the crystal, and coinciding with this line, is called its principal section, which term is also applied to any plane parallel to it.

187. We have already stated that an object seen through the crystal in its natural form (that form to which it is easily brought by cleavage) will give two images, one of which will appear in its situation according to the common law of refraction,

while the other will be observed thrown towards the lower obtuse angle, but always in the plane of the principal section. (The most convenient method to examine these facts is to pierce a small hole through any opaque plate, which may be applied to the lower surface of the crystal, and directed to a sheet of white paper). Let x A, x B, fig. 11, be the principal section of the crystal, and L a pencil of light falling on its surface, one part of the light will proceed in the ordinary direction (we will suppose perpendicularly), and is therefore called the ordinary ray, while the other portion of the light deviates considerably from this direction, and is called the extraordinary ray. I o will represent the ordinary, and I e the extraordinary ray.

188. Let the crystal be cut by two planes A B, and C D, fig. 12, parallel to the axis, and two other planes A C, and D B, perpendicular to the axis, to allow an object to be seen through it in the direction A C, or A B: it will be found that the two images will be farther separated, viewed in the direction A C, which is perpendicular to the axis, while in the direction of the axis there will be only one image. The inference from these experiments is, that there exists some peculiar force acting on the light passing through the crystal, producing a separation of the rays, and that this force emanates from the axis itself. As this produces a deviation of the second image towards, or from, the axis of the crystal, it is considered positive or negative, or, by Biot, attractive or repulsive.

189. The two rays into which a pencil of light is divided in passing through a crystal of Iceland spar are always of the same intensity, and always in the plane of the principal section. But the two emerging rays are not merely diminished in intensity by the division of the light between them, but have undergone a most important modification; for, if the rays be made to pass through another crystal, placed similarly to the first, there will be no subdivision of the light; the two images will be merely separated to a greater distance, from the increased thickness through which the light passes. If now the two crystals are so placed that the principal sections are at right angles to each other, there will still be only two images, but the ray ordinarily refracted in the first will become extraordinary in the second, and the extraordinary, ordinary. But at all intermediate positions of the two crystals there will be a subdivision of each ray, consequently four images: these four images will be of equal intensity when the principal sections of the two crystals are at an angle of 45° to each other; at all other angles one or other of the images diminish in intensity, as the principal sections approach to a perpendicular or parallelism: not by the coalescence of the two images, but by the gradual diminution of the intensity of one, and the augmentation of that of the other. In plate III. figs. 1, 2, and 3, we have supposed the rhomboids reduced to the form of cubes in all three, the axis is denoted by x , and the direction of the rays by the lines passing through the figure, and the letters e and o the extraordinary and ordinary

rays. It is thus seen that each emerging ray is only subject to a farther division, in particular positions of the second crystal; whereas natural light is always divided into two portions of equal intensity. Each ray has suffered a physical change; it is not acted on by the force of the second crystal, as natural light would be, but requires that the force be applied in a particular direction relatively to the modification it has received from the first crystal. This has been called *polarisation*. We know nothing of the poles, nor even of the molecules to which these poles are said to belong; it must be considered merely as a conventional term to express a phenomenon; and, to avoid the repetition of the conditions producing it, it is usual to consider the poles of the ordinary ray as coinciding with the principal section of the crystal, and those of the extraordinary ray in a plane perpendicular to it.

190. In these experiments an effect is produced on the two rays, by the passing through a crystal, which so modifies them that it requires the action of a second crystal to be exerted in two directions, at right angles to each other, to produce a similar effect. As direct light is always divided into two rays of equal intensity by a double refracting crystal, it may be used as a test to discover and ascertain the direction of polarisation.

191. When light is reflected from the surface of transparent bodies it is found to be polarised in the plane of reflection, more or less completely, according to the angle formed with the surface. This angle varies for different substances, and to Dr. Brewster we are indebted for a law connecting the angle with the index of refraction of the given body, viz. 'that the tangent of the angle of polarisation, measured from the perpendicular, is equal to the index of refraction,' when complete polarisation, or the greatest the body is capable of, is produced.

192. The index of refraction is a number having the same proportion to 1 that the line of the angle of incidence has to the angle of refraction. It is, therefore, constant for all angles of incidence in the same body. It is generally calculated for light passing from a vacuum into the given body.

193. From this law are deduced three consequences:—

1. That the complement of the angle of polarisation is equal to the angle of refraction.

2. That the reflected ray is perpendicular to the refracted ray.

3. That the angles of polarisation and refraction are together equal to a right angle.

194. Let CE, fig. 4, be the incident ray at the angle of complete polarisation, RE the reflected ray, and EG the refracted ray.

The sine DC : sine GH :: index : 1
But index = tangent AB; and radius AE = 1
As AB : AE :: DC : GH

AB : DE :: DC : DE :: GH = DE = CS, and the angle CES = angle GEH.

HES is a right angle, from which is taken GEH. But as GEH = CES = RES — RES + GES = a right angle.

195. This law gives an easy method to determine the angle of polarisation of any body of

which the index of refraction is known. Look in a table of tangents for the given index as a tangent, and the corresponding angle will be the angle of polarisation. If such a table be not at hand, let SS be the surface, and AE drawn perpendicularly; from a scale make AB = index, AE being 1. Join BE, and the angle AEB will be the required angle.

196. The index is generally given, for light passing from a vacuum; if it be required to determine the index under other circumstances, divide the index of the given body by the index of the medium from which it passes, and the quotient will be the index required. In bodies the opacity of which prevents the direct measurement of the angle of refraction, the angle of polarisation gives the index of refraction; if this law be rigorous, which it appears to be for all bodies which have been yet examined, though M. Fresnel seems to think it more probably an approximation.

197. We may here remark that some authors give the angle of polarisation measured from the surface: and sometimes the index of refraction is calculated on the passage from air.

198. We may here mention that Malus and Biot state, that the peculiar influence of crystals is not excited on light reflected from their surfaces; and that the angle of polarisation is the same whether the plane of incidence be parallel, perpendicular, or oblique, to the principal section of the crystal. But Dr. Brewster found a difference of more than 2°. He found the angle of polarisation to be 57° 14' when the incidence was in the plane of the principal section, and 59° 32' when in a plane perpendicular to it. The surface was that produced by a careful cleavage of the crystal.

199. One of the first laws of optics is, that 'light falling on a plane mirror is reflected at an angle equal to the angle of incidence;' but, if this mirror be transparent, the light so reflected is found to have received a polarity in the plane of reflection, more or less complete as the angle of incidence approaches the angle of polarisation for the substance employed. In fact there is some trace of polarisation discernible in light reflected from every body, at every angle of incidence except the perpendicular; but this in so feeble a degree, that we may consider it, at present, insensible, except from transparent bodies.

200. We have already explained that there are, for some bodies, certain angles, at which complete polarisation takes place; in some others, though very transparent, yet of high refractive power, complete polarisation does not take place at any angle, as in the diamond; in others, as black marble, ebony, black varnishes, where the refractive density is less, complete polarisation takes place, though they be opaque. This angle for water is 62° 45' from the perpendicular, and about 55° for glass.

201. In our explanation we may have recourse to an instrument, which, though not indispensable, will be found useful in many experiments where accuracy is required. But, for the satisfaction of any one as to the general facts, two pieces of unsilvered mirror glass are all that will

be essential, as in fig. 5. The reflected ray is seen to descend upon the plate A, which would have been polarised if the angles had been 35° , and consequently not reflected. But partial polarisation is produced by the plate B. The instrument shown at fig. 6 hardly requires description. It consists of a tube having a frame at each end, holding reflectors A and B, which are capable of being adjusted to any angle with the axis of the tube, and of being turned round the tube so that the planes of reflection may be at any angle to each other. Suppose the two mirrors (of unsilvered glass) inclined on their axis to the polarising angle 35° , remove the mirror B, and make a ray of natural light passing through the axis of the tube fall on the mirror A, it will be found that the light will be reflected equally in whatever direction the mirror is turned by the ring D, whether upwards or downwards, to the right or to the left. Let now the mirror B be replaced, and the apparatus so placed that the light reflected from it falls on the other mirror A, if the plane of reflection of the two mirrors coincide; that is, if the plane of each reflection is towards the same direction. To an eye placed opposite A there will be a reflection of a considerable part of the light incident on it. After being satisfied that there is in this position a partial reflection of the light, turn the ring D a quarter round either to the right or left, and with it the mirror A (the inclination of which to the axis remains the same), and on looking on the mirror there will be now found a total obscuration, that is, no light will be reflected, the whole passing through the glass. To be satisfied that this does not take place from any accidental derangement of the instrument, it is only necessary to turn the mirror slowly from one position to the other, and a gradual diminution of the intensity will be observed, passing from its maximum in the first position to complete obscuration in the last, or when the plane of the first reflection is at right angles to what would have been the plane of the second reflection had the light been direct.

202. A farther proof that this is no deception is afforded by substituting a metallic reflector in the place of the mirror B; in which case no such alteration takes place.

203. To return to the experiments. Continue to turn the mirror A gradually in the same direction, so that the reflection is again parallel to the first, but in an opposite direction, and the light will be again at a maximum; and, if the mirror be still turned in the same direction until it has made three-fourths of a revolution, the light reflected will again be reduced to nothing.

204. In this experiment we see that light, having been reflected from a surface at a certain angle, is entirely transmitted by another mirror, if the plane of incidence on the second mirror is perpendicular to the plane of incidence on the first, while natural light would have been equally reflected in every position.

205. It must be observed that, if the angle of reflection of either mirror be greater or less than the angle of polarisation, there will not be a total obscuration. The angle made by the two planes of reflection is often called the azimuth.

To succeed perfectly in this experiment the back of each mirror should be blackened, to prevent the admission of extraneous light. It will now be not difficult to show that the direction of polarity, in the reflected light, is to the plane of reflection, similar to the polarity of the ordinary ray in Iceland spar to its principal section, or an identity of the modification produced in the reflected ray and the modification produced by the action of the crystal on the ray ordinarily reflected; for if the ray reflected from water or glass at the polarising angle be received on a crystal of Iceland spar, the principal section of which coincides with the plane of reflection, the ray entering the crystal will proceed through it in the same direction that the ordinary ray, emerging from another crystal, would have proceeded. But, if the principal section of the crystal be placed perpendicular to the plane of reflection, the ray will be reflected extraordinarily; but in both positions there will be no bifurcation of the ray. If the principal section of the crystal be any otherwise situated, as to the plane of reflection, there will be two rays, but of equal intensity, when the angle contained between these two planes is 45° . If, again, the ordinary ray emerging from a crystal be made to fall at the proper angle, on the surface of water, or any other reflecting surface capable of polarising light completely, it will be reflected when the principal section and plane of reflection coincide, but entirely transmitted when the planes are perpendicular to each other. But, if the extraordinary ray fall on the surface, the reflection will take place when the planes are at right angles, and a total transmission will result when the planes coincide.

206. We are therefore justified in assuming that the physical change the light has suffered is the same in the two cases. That whether an ordinary ray be examined by subsequent reflection, or the reflected ray by a doubly reflecting crystal, the influence is, that the polarity of each is in the same direction: the one in the plane of the principal section, and the other in the plane of reflection.

207. Light is not only reflected from the first surface of transparent bodies, but another portion is reflected from the second surface. We will suppose these two surfaces parallel, and it will not be difficult to see, that if the light be completely polarised by reflection from the first surface 'a', fig. 7, the portion reflected from the second surface 'b' will also be completely polarised, and in the same plane.

208. Let A I be the incident ray, and I R the reflected polar ray; I I the refracted ray, partially reflected and refracted to R' and I' G, the remaining refracted light will be perpendicular to I' R', the reflected ray, a condition we have seen before producing complete polarisation.

209. From various experiments it has been proved that the quantity of light reflected, even from the two surfaces of a transparent body, is small in proportion to the incident light, and it is now convenient to enquire the condition of the refracted portion, under circumstances in which polarisation of the reflected light is produced. If the ray I G', fig. 7, be examined by a rhomboid,

it will be found divided into two rays, but not of equal intensity; for the ordinary or extraordinary ray will be found the more intense, as the section of the crystal is parallel or perpendicular to the plane of refraction. This condition of light is called partial polarisation, and is the same as the state of reflected light when the incidence is not such as to produce complete polarisation.

210. M. Arago gives the following experiments:—Let us suppose a plate of glass, *ED*, fig. 8, placed perpendicularly on a sheet of fine white paper *AB*, the eye placed at *O* will see at the same time the reflected ray *aio*, and the refracted ray *bio*; interpose an opaque plate perforated with a small hole *S*; let the eye at *O* be furnished with a doubly refracting crystal *C*. If by a black screen, placed between *b* and *i*, we stop the ray *bi*, which would have been transmitted by the glass plate, the hole in the plate *S* is illuminated by the reflected light alone; and if the principal section of the crystal coincide with the plane of reflection, we see two images of the pole, of which the ordinary is the most brilliant. If the screen be now so placed as to intercept the reflected ray, *aio*, there will be still two images, but now the extraordinary will be the most brilliant.

211. Now, if the screen be entirely removed, allowing both reflected and refracted light to reach the crystal, the intensity of the two images is found by actual experiment to be exactly equal. It is hence to be inferred, that the plane which contains the poles of light, polarised by transmission, is perpendicular to the plane which contains poles of light polarised by reflection; and that the quantity of polarised light, contained in the ray transmitted by a transparent plate, is exactly equal to the quantity of polarised light contained in the ray reflected from its surface, whatever the angle of incidence may be. M. Arago observes, that a body which, at its angle of complete polarisation, would reflect half the incident light from its surface, would also completely polarise the transmitted ray; and that when there is no transmission of light there is no polarisation; and which seems proved experimentally, as no trace of partial polarisation is discoverable in the light reflected from the interior of a glass prism, when the reflection is total.

212. As transparent substances reflect but a small portion of the incident rays, the quantity of polarised light in the transmitted ray is small in proportion to the light which has not undergone that modification. Dr. Brewster considers the transmitted ray as consisting of one portion completely polarised in a plane at right angles to the plane of incidence, and another portion of light 'which has suffered a physical change more or less approaching to complete polarisation.' Light, having passed through a pile of plates, is at last polarised in a plane perpendicular to the plane of polarisation of the reflected light. This effect requires the agency of twenty-four plates at an incidence of 61° ; 'consequently,' says Dr. Brewster, 'twelve plates will not polarise the whole pencil at that angle. Let us now suppose that the quantity not polarised amounts to twenty out of 100, then if these twenty were abso-

lutely unpolarised, and in the same state as direct light, they would require to pass through twenty-four plates in order to be completely polarised. But experiments prove that they require to pass only through twelve other plates to be completely polarised; it therefore follows that the twenty rays have been half polarised by the first twelve plates, and the polarisation completed by the other twelve.'

213. This reasoning may be good; but as Malus, Biot, and Arago, consider this partially polarised light to consist of light completely polarised, and light in the state of direct or natural light—and as this view of the question admits of a ready explanation—we shall adopt it.

214. Let *a*, *b*, *c*, *d*, be supposed to represent the successive plates through which the incident ray 1000 is to pass, and at a given angle, fifty out of 100 be completely polarised by reflection, and a similar quantity of rays by refraction; the light emerging from the first lamina will consist of 900 in the state of direct light, and fifty of light polarised in a plane perpendicular to the plane of incidence. We have already seen that light polarised in one plane will not be reflected in a plane perpendicular to its plane of polarisation, and consequently the portion fifty of transmitted light will escape reflection from the lamina *b*, and therefore the light reflected from *b*, which we have supposed one-twentieth of the incident light, must be taken from the 900 of direct light. In this manner we may suppose the quantity of direct light constantly diminished, and the polarised light increased by each succeeding transmission. According to this view, complete polarisation could never be produced, but the quantity of direct light, after a few transmissions, would be absolutely imperceptible.

215. It cannot be necessary to explain the result of submitting the ray emerging from a succession of plates to another pile of plates, to a doubly refractive crystal, or to a reflection from a polarising surface. It is in all respects similar in its polarisation relatively to the plane of incidence on the first surface to the extraordinary ray transmitted by a crystal, relatively to its principal section.

216. We will, however, mention one consequence of the foregoing laws; that polarised light, falling on the first surface of a pile of plates, will be partially reflected when the plane of incidence coincides with the plane of polarisation; and, a farther portion being also reflected at each successive plate, an eye placed at the back of the plates will receive no sensible quantity of light. If, on the contrary, the plane of polarisation be perpendicular to the plane of incidence, the whole light will be transmitted. It therefore follows that an apparatus may be constructed of the most transparent plates of glass, in two piles or bundles, forming a system perfectly transparent in one position of the piles, yet perfectly opaque in another. This effect is only to be produced by a great number of plates of glass, if the incidence be near the perpendicular; yet some substances possess this property of polarising transmitted light, whatever the incidence. A thin plate of tourmaline, cut parallel to the axis of the crystal, completely polarises the light at any incidence

in a plane perpendicular to the axis, and a second plate will transmit or stop all the rays, as the axis of the two plates are parallel or perpendicular to each other.

217. Dr. Brewster found that a plate of agate, having surfaces perpendicular to its lamina, about one-fifteenth of an inch in thickness, completely polarised the transmitted light.

218. Dr. Brewster, in the course of his experiments on the absorption of polarised light, had occasion to investigate the law of a very interesting class of phenomena, which appeared by the transmission of common light in different directions through crystallised bodies. Cordier, when he discovered the dichroite, observed the two colors of the light which it transmitted in different directions, and gave it the name of dichroite on the presumption that nature had confined to this mineral the property of giving two colors. The count de Bournon had observed the double color in small crystals of mica, and the marquis de Drée had noticed a similar fact in the tourmaline. During the experiments of Dr. Brewster he found that dichroism was a very common property of crystallised bodies; that it was related to the axes of double refraction, whether the crystal had one or more axes; and that it arose from the absorption of common light modified by the doubly refracting forces of the crystal.

219. As the phenomena of dichroism are very beautiful, and can be seen without any apparatus and merely by exposing the crystals to a common light, we shall describe the most important facts as they are seen in mica, augite, and tolite.

220. There are many crystals of mica which exhibit the phenomena of dichroism, but it is only in some of the small hexahedral crystals, which are transparent in a direction perpendicular to the lamina, that they are seen to the greatest perfection.

221. In one of these crystals, where the inclination of the resultant axes was about 11° , Dr. Brewster found that it was highly transparent in a direction coincident with the plane of the laminae, even at a thickness of one-sixth of an inch; in this position the extraordinary ray only was transmitted. As the inclination of the ray to the laminae increased, the intensity of the transmitted light diminished; and, in a direction perpendicular to the laminae, the crystal was perfectly opaque. * A candle, whose light was freely transmitted through a thickness of 0.243 of an inch across the faces of the hexagonal prism, was completely invisible through the terminal planes when the thickness was only 0.040 of an inch. Another crystal, which in one direction was as transparent as the ordinary specimens of olivine, would not admit through a thickness of one-tenth of an inch a single ray of the meridian sun on the 20th of May, when it passed along the axis of the prism. The ordinary ray, which was entirely lost in one direction, became gradually visible in thin plates, and at last of equal intensity to the other ray, as the ordinary light formed a greater angle with the laminae.

222. Out of a piece of yellowish-brown agate without any crystalline form, Dr. Brewster cut plates with parallel and well-polished surfaces. When one of these plates was exposed vertically

to common light, the transmitted light had a moderate intensity. When it was inclined to one side in the plane of one of its neutral axes, the light became more and more intense as the obliquity increased, notwithstanding the increased thickness of the mineral through which the light had to make its way. Upon examining the transmitted light, with a prism of calcareous spar, it was found to be all polarised in a plane perpendicular to the plane of inclination.

223. When the plate was now inclined from this last position, in the opposite direction, but still in the plane of the same neutral axis, the intensity of the light gradually diminished, till, on the other side of the perpendicular, the plate became absolutely impervious to the strong rays of the sun. Upon again examining the transmitted light with a prism of calcareous spar, before the plate had become opaque the pencil which had formerly vanished now re-appeared, and gradually increased in intensity becoming more and more green, while the other pencil, which became fainter, grew more and more red, till at a very great obliquity the one pencil became perfectly green, and the other deep blood-red. By exposing the plate to the polarised light of the sun, the red and green were alternately absorbed, according to the position of the neutral axis with respect to the plane of primitive polarisation.

224. If we now take two plates of augite, one of which has been cut from the other, and adjust each of them separately in a position where the sun's rays are very much enfeebled: if they are then brought together, without altering the inclination of the incident light, the sun's rays will penetrate through both the crystals, even though the one is turned round before the other, the incidence remaining the same. If, on the contrary, we adjust each of the plates separately, in a position where the transmitted light is a maximum, and where the eye cannot endure the strength of the solar ray; and if they are then brought together, so that the planes of incidence are transverse to one another, not a single ray of light will reach the eye. The cause of this is obvious; as the light transmitted through the first plate is all polarised in one plane, it is all absorbed by the second plate when placed in a transverse position. Though this same fact is seen in agate, yet it becomes doubly interesting to observe the light all polarised in one plane, when the transmitted pencil is a maximum.

225. Iolite, so called by Haiiy from its bluish-violet color, crystallises in six or twelve-sided prisms, which appear of a deep blue color when seen along the axis, and of a yellowish-brown color when seen in a direction perpendicular to the axis. If $abcd$, fig. 9, is a section of a prism of iolite, by a plane passing through the axis of the prism, the transmitted light will be blue through the faces ab and dc , and yellowish-brown through ad , bc , and in every direction perpendicular to the axis of the prism. If we grind down the angles a, c, b, d , so as to replace them with faces m, n, m', n' , and op, o', p', p' , inclined $31^\circ 41'$ to ad , or to the axis of the prism; then, if the plane $abcd$ pass through the resultant axes of double refraction, we shall observe, by

transmitting polarised light through the crystal in the directions ac , bd , and subsequently analysing it, a system of rings round each of these axes. The system will exhibit the individual rings very plainly if the crystal is thin; but if it is thick we shall observe, when the plane $abcd$ is perpendicular to the plane of primitive polarisation, some branches of blue and white light, diverging in the form of a cross from the centre of the system of rings, or the poles of no-polarisation, as shown at p and p' , fig. 10, where the shaded branches represent the blue ones. The summits of the blue masses at p and p' are tipped with purple, and are separated by whitish light in some specimens and yellowish light in others. The white light becomes more blue from p and p' to o , where it is quite blue, and more yellow from p and p' to c and d , where it is completely yellow. When the plane $abcd$ is in the plane of primitive polarisation, the poles p, p' are marked by spots of white light, but every where else the light is a deep blue.

226. In the plane $cadb$, fig. 10, the mineral, when we look through it at common light, exhibits no other color but yellow mixed with a small quantity of blue, polarised in an opposite plane. The ordinary image at c and d is yellowish-brown, and the extraordinary image faint blue; the former acquiring some blue rays, and the latter some yellow ones from c and d to a and b , where the difference of color is still highly marked. From a and b towards p and p' the yellow image becomes fainter till it changes into blue, and the weak blue image is reinforced by other blue rays, till the intensity of the two blue images is nearly equal. The faint blue image increases in intensity as the incident ray approaches from c and d to p and p' , and the yellow one acquiring an accession of blue light, becomes bluish-white. From p and p' to o the ordinary image is whitish, and the other deep blue; but the whiteness gradually diminishes towards o , where they are both almost equally blue, the ordinary image being more luminous at o . From a and b to o the yellowish image becomes more blue, and the bluish image also more blue.

227. The principal axis of iolite is negative, and its greatest refracted image is purplish-blue, while the ordinary or least refracted image is yellowish-brown, passing into one another as above described. The index of the ordinary refraction is about 1.549; and the mineral belongs to the prismatic spectrum of Moh's, though both this mineralogist and M. Haiiy place it under the rhomboidal system.

228. The splendid exhibition of colors which distinguishes mother-of-pearl from every other substance, and the successive development of fresh tints by every gentle inclination of the plate, have always been ascribed to the lamellated structure of the shell, and have been regarded as a fine proof of Newton's theory of the colors of natural bodies. Dr. Brewster has given an account of some experiments which he performed on this substance, in the Transactions of the Royal Society for 1814, and he observes, that he had no disposition to call in question this explanation, nor do the general train of his experiments lead him to such an enquiry. In examining the

colored rings which mother-of-pearl, like the topaz, exhibits by polarised light, and in ascertaining the relation between its refractive power and the angle at which it gives polarity to the reflected ray, he was under the necessity of grinding and polishing, with the utmost care, various plates of this substance. The development of new colors and the extinction of others, which took place during these processes, indicated the operation of some unknown and extraordinary cause, and encouraged him to pay the most minute attention to all the phenomena which were presented. The results of this investigation we shall endeavour to explain under the four following heads

I. On the optical properties peculiar to mother-of-pearl.

II. On the communication of these properties to other bodies.

III. On the causes by which these phenomena are produced.

IV. On a new species of polarisation peculiar to mother-of-pearl.

229. I. Mother-of-pearl sometimes possesses a regular, and sometimes an irregular structure, and has a striking resemblance to the agate, in the immense variety of forms which it exhibits. Sometimes it is composed of parallel or concentric laminæ: sometimes the veins are inflected in various successions, and sometimes it exhibits the same appearances as those which constitute what is called the hammered agate.

230. The regularly formed mother-of-pearl is of a uniform whiteness, somewhat resembling the pearl itself, and, in day light, scarcely exhibiting any of the prismatic colors; and, unless it is mentioned, this was the kind which Dr. Brewster employed in these experiments.

231. Let AB , fig. 1, plate IV., be a plate of mother-of-pearl, not polished, but having its two surfaces ground perfectly, either upon a blue hone or upon a plate of glass with the powder of schistus, and let the light Rr of a candle be incident at any angle on the point r , this ray will be reflected according to the ordinary law, so that the angle RrC is equal to CrS , and the lines Rr , Cr , and Sr , in the same plane.

If the eye is now placed very close to the mother-of-pearl at B , so as to receive the reflected rays, it will perceive at S , in the direction rS , the common reflected image of the candle which will not be very bright, owing to the roughness of the reflecting surface. On the lower side of S' at the distance of some degrees there will also be seen a highly colored image of the candle at s , formed by rays reflected in the direction rs . In this spectrum the blue rays are nearest the common image, and the color is so great that it requires a prism of flint glass with a refracting angle of 65° to correct it, a large secondary spectrum being left, having the uncorrected green towards the vertex of the prism.

232. If the candle at R is kept steady, and the plate AB turned round r as a centre, so that the ray Rr may preserve the same angle of incidence, the colored ray rs will have a motion of rotation about rS , the common section AB of the plane rsS and the surface of the mother-of-pearl being invariable.

229. The line AB may be called the axis of extraordinary reflection; the extremity A , towards which the colored ray s is reflected, the primary pole of extraordinary reflection; srC the angle of extraordinary reflection; and srS the angle of aberration.

234. If the ray Rr is now reflected from the opposite surface of the mother-of-pearl, as represented in fig. 2, the same phenomena will be observed; but the colored ray rs will now be reflected towards B , and will be seen at s' above the common image S' , being formed by rays reflected in the direction rs . The extremity B therefore of the axis AB will be the primary pole of extraordinary reflection for the lower surface. Hence the two surfaces of mother-of-pearl have always their poles in opposite directions, unless in specimens where a change of structure takes place.

235. Let the plate AB be now brought into

the position in fig. 1, where the plane rsS coincides with the plane of ordinary reflection RrS , and let it be placed upon a goniometer so that we may ascertain by measurement the changes which take place by varying the angle of incidence RrC . It will then be found that the angle of aberration srS regularly increases with the angle of incidence. The variations which it undergoes are represented with tolerable accuracy in the following table; but, owing to the elongation and indistinctness of the colored image at large angles of incidence, the measures are not susceptible of great correctness. The first column contains the angle of incidence; the second the complement of that angle; the third the angle of aberration as determined by experiment; and the fourth, formed by adding the second and third columns, contains the complement of the angle of extraordinary reflection.

| Angle of Incidence. | Complements of the Angle of Incidence. | Observed Angle of Aberration. | Complement of the Angle of Extraordinary Reflection. | Calculated Angle of Aberration. |
|---------------------|--|-------------------------------|--|---------------------------------|
| 86 40 | 3 20 | 9 14 | 12 34 | 9 26 |
| 85 | 5 | 8 46 | 13 46 | 8 38 |
| 82 30 | 7 30 | 7 58 | 15 28 | 7 41 |
| 80 | 10 | 7 12 | 17 12 | 6 55 |
| 75 | 15 | 5 50 | 20 50 | 5 52 |
| 70 | 20 | 6 0 | 25 0 | 4 56 |
| 65 | 25 | 4 9 | 29 9 | 4 17 |
| 60 | 30 | 3 45 | 34 45 | 3 44 |
| 55 | 35 | 3 25 | 38 25 | 3 20 |
| 50 | 40 | 3 9 | 43 9 | 3 1 |
| 45 | 45 | 2 53 | 47 53 | 2 48 |
| 40 | 50 | 2 35 | 52 35 | 2 37 |
| 35 | 55 | 2 30 | 57 30 | 2 28 |
| 30 | 60 | 2 25 | 62 25 | 2 21 |
| 25 | 65 | 2 17 | 67 17 | 2 15 |
| 20 | 70 | 2 13 | 72 13 | 2 9 |
| 12 | 78 | 2 7 | 80 7 | 2 7 |
| $RrC = SrC$ | $A = SrB = RrA$ | $x = srS$ | $A + x = srB$ | s |

236. If we now compare the angles of aberration in the third column with the angles of extraordinary reflection in the fourth column, and make

$A = RrA = SrB$, the complement of the angle of incidence or ordinary reflection.

$x = srS$ the angle of aberration.

$A + x = srB$ the complement of the angle of extraordinary reflection, it will be found that

$\sin. s : \sin. s' = \sin. A' + x' : \sin. A + x$

That is, the sines of the angles of aberration are to one another inversely, as the sines of the complements of the angles of extraordinary reflection.

237. Assuming the numbers in columns third and fourth, Dr. Brewster has, upon this principle, computed those in the fifth, which are the calculated angles of aberration, and which agree very strikingly with the observed angles.

238. If we now turn round the mother-of-pearl 180° , so that the pole A may be brought into the position of B , the ray rs will be reflected towards the pole A , fig. 2, and the complement of the angle of extraordinary reflection will be equal to the difference between the angles of aberration and the complement of the angle of ordinary reflection. In this case we shall obtain the results given in the following table.

| Angle of Incidence. | Complement of the Angle of Incidence. | Observed Angle of Aberration. | Complement of the Angle of Extraordinary Reflection. | Calculated Angle of Aberration. |
|---------------------|---------------------------------------|-------------------------------|--|---------------------------------|
| 60 | 30 | 4 30 | 25 30 | 4 33 |
| 55 | 35 | 4 37 | 31 23 | 3 46 |
| 50 | 40 | 3 11 | 36 49 | 3 16 |
| 45 | 45 | 2 57 | 42 3 | 2 56 |
| 40 | 50 | 2 38 | 47 22 | 2 40 |
| 30 | 60 | 2 16 | 57 44 | 2 19 |
| 20 | 70 | 2 7 | 67 53 | 2 7 |
| | A | s | A—s | s |

239. By comparing the observed angles of aberration with the complements of the angles of extraordinary reflection, we shall find that

$$\sin. s : \sin. s' = \sin. A' - s' : \sin. A - s,$$

which indicates the same relation as formerly between the angles of aberration and extraordinary reflection. Upon this principle Dr. Brewster has computed the numbers in the fifth column which agree very well with the observed angles.

240. While the primary pole A is describing a semicircle round r till it reaches B, and another semicircle from B to A again; a point s in the extraordinary ray rs will describe a curve round S composed of two semi-ellipses having the same conjugate axis, but having their semi-transverse axes of different lengths. Thus, in fig. 3, if S be a point in the reflected ray rS , fig. 2, and Ss , SN , $S\epsilon$, SM , different values of the angles of aberration when the pole A is in the directions Ss , SN , &c.; then the point s will describe the semi-ellipse $M\epsilon N$, and the semi-ellipse $M\epsilon N$, which have their conjugate axis MN common, and their semi-transverse axes Ss , $S\epsilon$, of unequal lengths. The conjugate axis MN is a constant quantity, while Ss , $S\epsilon$, vary according to the law already mentioned. At different angles of incidence, therefore, the point s will describe other curves such as $M\epsilon' N\epsilon'$, which approach to a circle as the angle of incidence diminishes.

241. The angles of aberration vary in different pieces of mother-of-pearl, but there is no deviation from the laws which have just been explained.

242. On the outside of the extraordinary ray rs , fig. 1, a mass of colored light rp makes its appearance nearly at the same distance from the extraordinary image that the extraordinary image is from the common image: these three images are always in a straight line, but the angle of aberration of the mass of colored light varies according to a law different from that of the extraordinary ray. At great angles of incidence this mass of light is of a beautiful crimson color. At an angle of about 37° it becomes green, and at less angles of incidence it acquires a yellow hue, approaching to white, and becomes very luminous. These colors, which become more brilliant when the mother-of-pearl is polished, vary with the thickness of the plate.

243. The fracture of mother-of-pearl always reflects the extraordinary ray rs , as if the surface

of the fracture were parallel to the real surface; but, when the fracture is ground flat, no extraordinary reflection takes place.

244. When the extraordinary ray rs is reflected from another piece of mother-of-pearl, it experiences, as might have been expected, both an ordinary and an extraordinary reflection. In virtue of the ordinary reflection, an image is formed exactly like the extraordinary image; but in virtue of the extraordinary reflection, the highly colored image is sometimes rendered more highly colored, and at other times converted into a greenish white image, according as the second reflection conspires with, or opposes the first.

245. Hitherto we have attended to the phenomena only when the surface is rough and unpolished. When a slight degree of polish, however, is communicated to it, a new colored image appears on the opposite side of the common image formed by the rays rt , figs. 1 and 2. This new image resembles in every respect the other colored image, and follows the same laws; and, after a high degree of polish is induced upon the mother-of-pearl, it is almost as bright as the first colored image which has its brilliancy somewhat impaired by polishing. If the polish is removed by grinding, the second colored image vanishes, and the first resumes its former brilliancy. As this second image is reflected towards the pole A in fig. 1, and the pole B in fig. 2, they may be called the secondary poles of extraordinary reflection.

246. If we now examine the light transmitted by the mother-of-pearl, we shall perceive phenomena analogous to those which have been described. A colored image will appear on each side of the common image, having the same angles of aberration as those seen by reflection, and resembling them in every respect, the blue light being nearest the common image, and the red light farthest from it. These two images, however, are usually fainter than those seen by reflection, and, when the second extraordinary reflected image is extinguished by removing the polish, it is then the most brilliant when seen by transmission; and in general the image which is brightest by reflection is faintest by transmission.

247. In some irregularly formed pieces of mother-of-pearl which are ground very thin, and in which the axes of extraordinary reflection for the two surfaces are not coincident, four colored images are seen by transmission. Two of them

are produced by each surface, and the line which joins the two images formed by the same surface always coincides with its axis of extraordinary reflection. It is also deserving of notice that the transmitted extraordinary ray is bent towards the same pole as the extraordinary reflected ray to which it belongs.

248. Like all other bodies, mother-of-pearl polarises light by reflection, and the angle at which the quantity of polarised light is a maximum is about 59° . The two extraordinary images are also polarised at the same angle, but the mass of green and crimson light exhibits no marks of polarity. This substance has also the property of depolarising light in every position like horn, tortoise-shell, caoutchouc, and gum arabic.

249. II. The phenomena which have now been described must be admitted to be very singular and instructive; and it is probable that some philosophers would have contented themselves with ascribing them to reflections from directly inclined planes in the interior of the mother-of-pearl.

250. In order to measure the angles contained in the preceding tables, Dr. Brewster had occasion to fix the mother-of-pearl to a goniometer by a hard cement. Upon removing it from the cement the plate left a clean impression of its own surface, and he was surprised to observe that the cement had by this means received the property of producing the colors which were exhibited by the mother-of-pearl. This strange result he at first attributed to a thin film detached from the plate, but subsequent experiments soon convinced him that this was a mistake, and that the mother-of-pearl really communicated to the cement the properties which it possessed.

251. Dr. Brewster has also succeeded in imparting the same faculty of producing color to black and red wax, balsam of Tolu, gum arabic, gold leaf placed upon wax, tinfoil, the fusible metal composed of bismuth and mercury, and to lead by hard pressure, or by the blow of a hammer. When the impression is first made upon the fusible metal, the play of colors is singularly fine, but the action of the air corrodes the metal, and speedily destroys the configuration, as well as the polish of its surface. The same effect was produced when the metal was immersed in oil.

252. In order to show that in these cases no part of the mother-of-pearl is detached, he plunged the wax, after it had received the impression, into nitric acid, which had no effect either in destroying or diminishing the colorific property of the surface. In soft cements, made of bees' wax and rosin, the slightest degree of heat destroyed the superficial configuration by which the color is produced. In sealing-wax, gum arabic, and realgar, a much greater heat was requisite to remove the color; and in tinfoil and lead this could only be effected by the temperature at which they cease to become solid.

253. Let us now examine more minutely the phenomena which present themselves when the light is reflected from the surface of wax; and let us suppose that the impression upon the wax is made by the lower surface, when rough, of the mother-of-pearl, as represented in fig. 2, where

B is its primary and A its secondary pole. When the light Rr of a candle is reflected from the surface of wax A B, fig. 4, the extraordinary image, instead of being reflected towards the primary pole B as in fig. 2, is reflected from it, and A is the primary pole of the wax, whereas B was the primary pole of the mother-of-pearl. By polishing the mother-of-pearl, and taking a new impression from it, the wax will now reflect the other extraordinary image in the direction rt , and therefore B is the secondary pole of the wax. Hence it follows that mother-of-pearl communicates to wax and other bodies the optical properties of the surface opposite to that from which the impression is taken.

254. At different angles of incidence the two colored images formed by the wax follow the same laws as those produced by the mother-of-pearl; but the mass of green and crimson light never appears, and is therefore caused by some internal structure which cannot be communicated to other bodies. When an impression is taken from the fracture of mother-of-pearl, its faculty of producing color is also communicated.

255. In imparting to gum arabic and balsam of Tolu the superficial configuration of mother-of-pearl, we are enabled, on account of their transparency, to observe the changes induced upon the transmitted light. The extraordinary images formed by reflection were both visible, the primary one being remarkably brilliant, and the secondary one scarcely perceptible; but, when the light was transmitted through the gum, the primary image was nearly extinct, while the secondary one was unusually brilliant and highly colored, far surpassing in splendor those which are formed by transmission through the mother-of-pearl itself. When both the surfaces of gum arabic are impressed with mother-of-pearl, four images are seen. The colors seen by transmission are more brilliant in the gum than in the balsam, as the latter has the greatest reflective power; but the colored images produced by reflection do not seem to have suffered a greater dispersion when they are formed by the metals than when they are formed by cements.

256. When the impression is taken from a pearl, the wax receives a character similar to that which is possessed by the pearl. The image reflected from the surface of the pearl is enveloped in a quantity of unformed light, arising from a cause which will afterwards be explained; and the very same white nebulosity is reflected from the wax.

257. III. From a careful examination of the preceding facts, we must now be prepared to infer that all the peculiar phenomena of mother-of-pearl, as seen by reflection and transmission, are owing to a particular configuration of surface: that the communication of these properties to other bodies is the necessary consequence of the communication of its superficial structure; and that none of the light which is concerned in the production of these phenomena has penetrated the surface of the mother-of-pearl.

258. What this configuration of surface is, and in what manner it generates the colored images, are points of high interest, and of corresponding difficulty. The facts naturally lead us

to conjecture, that the extraordinary reflections are produced by faces either curved or rectilinear, slightly inclined to the general surface of the mother-of-pearl. In attempting to determine this point, Dr. Brewster anticipated no assistance from microscopical observations, as it was contrary to all our notions of the action of bodies upon light to imagine that a plate of mother-of-pearl reflecting an image as perfectly as the mirror of a telescope could exhibit to the human eye any superficial irregularities. These anticipations, however, were wholly erroneous. By the application of single microscopes with powers of 200, 300, and even 400, Dr. Brewster has discovered on almost every specimen of mother-of-pearl an elementary grooved surface, which no polishing can modify or remove. This structure resembles very closely the delicate texture of the skin at the top of an infant's finger; or the lines parallel to the coast upon a map, by which the engraver marks the limits of the sea and land. When the mother-of-pearl has a regular structure these grooves or lines are always parallel, but, when there is any irregularity of configuration, the grooves vary their direction, and are arranged in all possible forms like the veins of an agate, or like the lines upon the coast of a map, where are numerous inlets and islands to be represented.

259. Sometimes the spaces between the grooves are so wide that they can be seen with a magnifying power of six or eight times, and in one or two specimens he has observed them with the naked eye. At some parts of the surface the distance between the grooves is so small that he has counted more than 3000 in an inch; and in some pieces they can scarcely be detected with any magnifying power. When the space between the grooves is large a new groove often commences, and there is frequently a sudden change from a space with a series of distant grooves, to another space with a series of very close ones. Similar appearances were also seen in the structure of pearls. When the mother-of-pearl is scratched or indented, the bottom and the sides of the scratch are grooved exactly like the parts that are polished. The same grooved structure is likewise distinctly seen in wax, gum arabic, and the metals, after they have received the impression of the mother-of-pearl.

260. In every case the grooves are at right angles to the axis of extraordinary reflection, and hence in irregularly formed mother-of-pearl, where the grooves are often circular and have every possible direction, the axes of extraordinary reflection have also every possible direction, and the colored images appear irregularly scattered round the ordinary image. In the real pearl these colored images are crowded into a small space round the common image, on account of the spherical form of the pearl, and the various hues are thus blended into a white unformed light, which gives to this substance its high value as an ornament.

261. Having thus ascertained that the surface of mother-of-pearl is actually grooved, and different in this respect from all other bodies that have yet been examined, we must now seek, in

this peculiarity of structure, the cause of its optical properties. The facts which have been detailed will enable us to draw several important conclusions of a general nature, but they leave us in the dark respecting the immediate cause of the phenomena.

262. Let us now suppose that fig. 5 represents a section of a plate of mother-of-pearl, having $A a n m b c B$ for its upper surface, and $B' a' n' m' b' c' A'$ for its lower surface. Let OP be the line at which the attracting or refractive force ends, and where the repulsive or reflecting force begins, and let the reflecting force terminate at MN according to the Newtonian theory. We have already seen that when the surface AB of the mother-of-pearl is ground as flat as possible, and brought to a high polish, the light which is incident on the repulsive stratum $MNOP$ is reflected as in all other bodies, and affords a perfect image of the object from which it radiates. Hence it follows that the light which forms the extraordinary images has escaped reflection, and penetrated the attractive stratum OP ; and that its separation into colors and extraordinary reflection are produced by one or more causes residing between OP and the surface AB of the mother-of-pearl.

263. Let us first attend to the aberration of the extraordinary images. Since the real surface of AB is composed of faces inclined to the general surface, $A b c B$, we are led to suppose that the primary extraordinary image is reflected from the face m , while the secondary extraordinary image is reflected from the face n . Now this could only happen from two causes, either in consequence of the mother-of-pearl having a repulsive force different from the ordinary repulsive force which produces reflection: or from its possessing the power of reflecting light from its actual surface. That this extraordinary force is, in other respects, like the ordinary reflecting force, is manifest from a portion of the extraordinary pencil being transmitted, while the other portion suffers reflection. The existence of such a force being unquestionable, we have next to consider the form and position of the surfaces to which it belongs. The changes in the angle of aberration, at different angles of incidence, is a proof that the surfaces m, n , present different inclinations to the incident ray; and hence their form must be curvilinear, as represented by the dotted lines above m and n . If we suppose that the ray has been refracted before it experiences the extraordinary reflection, the angles of aberration still require that the faces have a curved form.

264. Taking the index of refraction $m = 1.653$, and making $A =$ angle of incidence; $a =$ angle of refraction, and consequently the new angle of incidence upon the faces m , or n ; $b =$ angle of extraordinary reflection, and $z =$ the inclination of the reflecting face m or n , then we shall have

$$\sin. a = \frac{\sin. A}{m} \text{ and } z = \frac{a + b}{2} - a = \frac{b - a}{2}$$

By calculating the value of z for different angles of incidence, we obtain the following results:—

Q

| Angles of incidence. | Inclination of the faces m or n . |
|------------------------|--|
| $86^{\circ} 41'$. . . | $20^{\circ} 8'$ |
| 70 . . . | 15 9 |
| 65 . . . | 13 48 |
| 60 . . . | 12 19 |
| 12 . . . | 1 20 |

But since the refraction cannot be completed when the ray reaches the surfaces m or n , having passed through only half the space of refracting activity, let us suppose the value of m corresponding to the partial refraction to be 1.300, and we shall have the following values of x :—

| Angles of incidence. | Inclination of the faces, m , n . |
|-------------------------|--|
| $86^{\circ} 41'$ | $13^{\circ} 34'$ |
| 70 | 9 16 |
| 65 | 1 19 |
| 60 | 7 14 |
| 12 | 0. 20 |

If the light, therefore, suffers either a total or a partial refraction, or if it suffers no refraction at all, the extraordinary reflection must be made from faces of variable curvature.

265. The most unaccountable circumstance, however, accompanying the extraordinary reflection, is the difference of effect produced upon the surfaces m and n by removing the polish. The surface m retains its power of reflecting the primary extraordinary image, notwithstanding the roughness which is thus superinduced, while the surface n loses the power of reflecting the secondary image, and acquires the faculty of transmitting the whole of the colored pencil which composes it. The force, therefore, which reflects the primary extraordinary image, would appear to be different from that which reflects the secondary extraordinary image, the latter being wholly dependent on the smoothness of the surface.

266. Hitherto we have avoided all consideration of the cause which separates the extraordinary pencils into their component colors, nor can we pretend to afford even a plausible conjecture respecting their origin. It is quite obvious that the separation into colors is produced before the pencil suffers extraordinary reflection, and, as the transmitted colors are not complementary to those which are reflected, it is equally manifest that the phenomenon has no connexion with the colors of thin plates. If the spectra were produced by the ordinary dispersive force of the body, then the dispersion ought to be least in gum arabic, greater in wax, and still greater in realgar and the metals, whereas in all these cases the quantity of color appears to be the same. The extraordinary spectra have no resemblance whatever to those which are the effect of inflexion; and, even if we could suppose that the light was inflected by the grooves, the cause would be inadequate to explain the continuance of the color, when the plane of incidence coincides with the direction of the grooves, and when there are manifestly no angles to bend the passing light.

267. But, whatever be the cause of the phenomena of mother-of-pearl, the facts themselves are

peculiarly instructive, and naturally lead us to the following conclusions :—

(1). Besides the ordinary forces which reflect and refract light, there reside without the surface of mother of pearl, and of all bodies to which its superficial configuration can be imparted, new forces which reflect light, and separate it into its component colors.

(2). The lines which bound the space of reflecting actively in all surfaces which possess this configuration, are straight, and are not parallel to the grooved structure of the surface. Hence a surface which appears, even to the unassisted eye, to be full of eminences and depressions, is capable of reflecting light with perfect accuracy.

(3). Since a particular configuration of surface, independent of chemical composition and crystalline structure, is capable of producing the most brilliant colors, may not the colors of all natural bodies be owing to the arrangement of their superficial particles, and may not the changes which these colors undergo by the action of light, heat, and atmospherical causes, arise from a corresponding change in the superficial structure? Dr. Brewster has endeavoured to communicate to wax the faculty of producing color possessed by Labrador spar, the metallic oxides, and various other bodies; but, though he has not succeeded in this attempt, it by no means follows that the color is not produced by the configuration of the surface. The structure may in these cases be so minute, that fluid wax cannot be forced into the grooves or depressions; and we have an approach to this delicacy of conformation in some specimens of mother-of-pearl, where the grooves cannot be seen by the most powerful microscopes.

(4). Since a particular structure of surface is always accompanied with a new repulsive force, residing nearer the body than the common repulsive force which produces ordinary reflection, may there not reside also, near the surface of all crystallised bodies, a new refractive force which produces double refraction? And is not this supposition countenanced by the fact that the extraordinary pencil formed by Iceland spar suffers the ordinary as well as the extraordinary refraction?

268. We may conclude this head with a few remarks on the crimson and green light, which always accompanies the primary colored image. This mass of light is never produced by the wax, and as it appears, even when the rays are incident upon the mother-of-pearl from a fluid of the same refractive power, it is evidently unconnected with the forms of surface. These masses of color appear to have the same origin as the colors of thin plates described by Newton. Even when the angle of incidence is the same, the crimson light appears at one thickness of the mother-of-pearl, and the green at a less thickness; and the transmitted light consists of colors complementary to those of the reflected light. We are, therefore, in this case, presented with phenomena almost exactly the same as those of thin plates, though produced by plates of mother-of-pearl of considerable thickness.

269. IV. Having seen, in the course of the preceding experiments, so many deviations from the ordinary laws of optics, Dr. Brewster sus-

pected that mother-of-pearl might exhibit similar anomalies in the polarisation of light. This conjecture was immediately confirmed by the discovery of a remarkable property, which forms the connecting link between the phenomena of polarisation, as effected by crystallised and uncrystallised bodies.

270. In all doubly refracting crystals, the opposite polarisation of the two images is invariably related to some axis or fixed line in the primitive form; while in uncrystallised bodies the polarisation is related to the planes of reflection and refraction, the reflected pencil being always polarised in an opposite manner to the refracting pencil. Thus, if $A B$, fig. 6, be a plate of glass, and $R r$ a ray incident upon it, at the polarising angle, the reflected ray $r S$ will be polarised in the same manner as one of the pencils formed by calcareous spar, and a small portion of the transmitted ray $r T$ will also be polarised, but in a manner opposite to $r S$ like the other pencil in calcareous spar: or, if the ray $R r$ is transmitted through a bundle of glass plates, the whole of the pencil $r T$ will be polarised in that manner.

271. If we now suppose $A B$ a single plate of mother-of-pearl about one-fortieth of an inch thick, and the angle of incidence $R r C$ about 60° , the reflected ray $r S$ will be polarised as in every other transparent body; but the transmitted ray $r T$ will be wholly polarised, and in the same manner as the reflected ray $r S$, while in every other transparent body that has been examined the ray $r T$ possesses an opposite kind of polarisation. If we now turn the plate $A B$ round its centre r , so as to preserve its inclination to the incident ray $R r$, no change whatever takes place, the transmitted ray still retaining its former polarity.

272. The angle of incidence $R r C$, at which the transmitted light $r T$ is wholly polarised, varies in the inverse ratio of the thickness of the plate $A B$, and the whole pencil is polarised at any angle greater than that angle. The relation between the angle of polarisation and the thickness of the plate remains to be determined; though he suspects it will be found that the tangents of the angles of incidence, at which the whole of the pencil is polarised, are inversely as the thickness of the plates.

273. The phenomena above described, Dr. Brewster has observed, in every piece of mother-of-pearl that he has tried; and as they are not affected when the incident pencil is refracted from balsam of Tolu, or any other cement, into the mother-of-pearl, they are obviously unconnected with its superficial configuration. Ivory does not produce the same effect upon light.

274. From these results, the following conclusions are clearly deducible:—

(1). That mother-of-pearl polarises light in a manner different from all crystallised bodies, the polarisation having no reference to any fixed line in the plate.

(2). That mother-of-pearl polarises light in a manner different from all uncrystallised bodies, the transmitted pencil being wholly polarised by a single plate, and in the same manner with the reflected pencil.

(3). That if mother-of-pearl polarises light in virtue of its laminated structure, the laminæ themselves must have the property of polarising light in a manner opposite to all other bodies.

275. Mr. J. F. W. Herschel, in repeating the above experiments of Dr. Brewster, observed some new phenomena exhibited by that singular body in its action on transmitted light, depending on the internal arrangement of its molecules, and at the same time connected with a peculiarity in its superficial appearance under the microscope, which seems to have eluded his notice. When a plate of mother-of-pearl, cut parallel to the natural surface of the shell, is reduced by grinding to a thickness between $\frac{1}{16}$ th and $\frac{1}{30}$ th of an inch, and highly polished on both sides (in which circumstances it is very transparent); if a distant candle be viewed through it, besides the pair of colored images described by Dr. Brewster, which have the same origin with those seen by reflection, there may be observed two large very brilliant and highly colored nebulous masses, one on each side of the candle, and equidistant from it, which may readily be distinguished from the preceding, by the following characters.

276. The first pair of colored images, originating in the transferable superficial structure of the pearl, are always similar in position and color, and complementary in brightness to those seen by extraordinary reflection. In consequence, nothing can be more capriciously irregular than their situation, brightness, and distance from the centre. On passing various parts of the plate, with a parallel motion between the pupil of the eye and the candle, they will be seen to shift their direction, expand, contract, or disappear altogether, with every change in the point examined. This is not the case with the pair of nebulous masses now under consideration, which undergo little or no variation in any of these particulars, through whatever portion of the plate they are viewed. The axis of nebulous dispersion then (or line joining the two nebulae) is parallel to itself, or nearly so, throughout the whole extent of the mother-of-pearl, and the energy of the cause producing it nearly or perfectly uniform.

277. These nebulous masses are usually about twice the distance of the colored images, described by Dr. Brewster from the centre; and, except the plate be very thin, are much larger and more conspicuous, and particularly distinguished from them by the equable gradation and softening of their colors, which are those of the prismatic spectrum, the red being outermost. Their angle of deviation, or distance from the central image, increases on inclining the plate in the plane passing through them; while their brightness rapidly diminishes, the former being a minimum, and the latter a maximum, at a perpendicular incidence. This angle, as well as the shape and color of the nebulae, is the same, or nearly so, in all the specimens Mr. Herschel has examined; nor does any marked variation in these particulars arise by a variation in the thickness of the plate, or by cutting it at any moderate angle with the natural surface; only, in the latter case, the maximum of their inten-

sity, and minimum of distance, takes place at such an angle of incidence that the ordinary ray traverses the substance in a direction perpendicular to the natural surface of the shell, which is also the direction of its greatest transparency. The minimum angle of deviation in the nebulous images appears to be

|-------------------------------------|---------|
| For the extreme red about | 10° 29' |
| For the mean rays | 6 59 |
| For the extreme violet. | 4 16 |

278. The extraordinary images seen by reflection, and their complementary pair by transmission, are completely obliterated by surrounding the mother-of-pearl with oil, or varnishing its surfaces. This, however, is so far from impairing the nebulous masses, that it heightens them a little, by perfecting the polish; and, should any doubt arise as to the identity of either pair, it may thus be immediately removed. From all these circumstances, compared with what Dr. Brewster has demonstrated respecting the former pair of images, we might reasonably conclude that the latter are entirely unconnected with any peculiarity in the superficial structure, and Mr. Herschel scarcely expected the application of the microscope to afford farther information, or lead to any result worth notice. On examining, however, many specimens of mother-of-pearl with a powerful double microscope, he found that this extraordinary body, in addition to the irregular grooved superficial structure, as described by Dr. Brewster, possesses another of great regularity and delicacy; but, like the former, resisting every attempt to impair it by polishing the surface. It may be seen to most advantage on a thin polished specimen, in which the first set of undulations vary a good deal in direction and coarseness. When we view such a plate successively with a series of increasing magnifiers, under a double microscope, a power of 123 will barely show, and one of 229 completely verify, the appearance of a minute system of rounded undulations, consisting as it were of fibres occasionally branching from each other, but never continued for any length. They are uniformly diffused over the whole surface, and, in their general direction, disposed in straight and exactly parallel lines, running from one end to the other. In consequence, they cross the first set of grooves at all angles, giving the whole surface much the appearance of a piece of twilled silk, or the larger waves of the sea intersected with minuter ripples.

279. The interval between these undulated appearances is nearly the same in all the specimens Mr. H. has examined. To ascertain it, twenty-five were counted in the space of an inch, in an image projected on a plane ten inches from the eye, while the diameter of a small wire, projected on the same plane with the same power, measured seven inches. The diameter of this wire taken by the spherometer being 0.0227 inches gives 0.000129, or $\frac{1}{7700}$ th of an inch for their mutual distance. To see them distinctly, a careful management of the illumination from below is necessary, and candle light must be used.

280. To demonstrate the connexion of these

undulations (which, whether real or apparent, we shall for brevity call the second set of grooves, denoting those observed by Dr. Brewster by the first set) with the nebulous masses above described, Mr. Herschel chose a plate in which the first set varied from the extreme of coarseness to that of delicacy, and were particularly irregular in their direction and curvature. In this he carefully marked, by small ink circles, numbered 1, 2, 3, 4, 5, 6, 7, which were then subjected to microscopic examination.

At No. 1 and 2 the two sets of grooves coincided in direction.

At No. 3 they made an angle rather more than 45° by the eye.

At No. 4 no grooves of the first set could be seen, but a power of 229 showed some obscure and very irregular traces of coarse elevations and depressions. With this power, however, the second set were seen precisely as in every other part of the surface, and in the same uniform direction.

281. At No. 5 the first set, as they approached this point, grew smaller and smaller, requiring powers of 26, 34, 43, 123, in succession to perceive them. With this latter power the second set just became visible; while with 229, both sets were seen crossing each other at right angles, with the most perfect regularity and distinctness, the former being about twice the breadth of the latter.

At No. 6 the direction of the first set varied a good deal, crossing the second from 45° to 60°.

At No. 7 they crossed at a small angle.

282. Mr. H. now detached the mother-of-pearl, and by passing a small sun-beam successively through each of the marked spots, and noticing the relative situations of the two pairs of colored images, it appeared that

At No. 1 and 2 the axes of dispersion in the first and second pair of colored images were coincident.

At No. 3 they made an angle of 45° with each other.

At No. 4 there were no colored images of the first pair whatever, while those of the second pair had precisely the same appearance and direction as in the other parts of the plate.

At No. 5 the axes of dispersion formed a right angle, the images of the first pair being very vivid, and separated by an unusually large interval.

At No. 6 the angles of dispersion formed an angle of 60°.

At No. 7 they were 17° inclined to each other.

283. In general, in different specimens, he could always predict, *a priori*, the situation of the nebulous masses of the second pair, by observing with the microscope the direction of the second set of grooves to which they are invariably at right angles; and the connexion between the two phenomena is thus clearly demonstrated. Yet this connexion is not, as in the case of the reflected colors, that of cause and effect. The nebulous masses, as we have seen, subsist when the grooves, if any, are obliterated by immersion in a fluid of equal refractive density. It is, therefore, in the internal structure of the pearl

that we must look for the common cause of both occurrences. When we examine a thin plate of this substance by polarised light, the phenomena of a crystal with two axes of double refraction are observed; the isochromatic lines being perfectly regular, and similarly disposed in all parts of the surface, and the colors, though not vivid and somewhat hazy, yet following in their proper order, and extending sometimes to six, seven, or eight, repetitions of the same color from either pole. If now, we notice the situation of the axes of double refraction, with respect to what has above been called the axis of nebulous dispersion, we shall find that the latter is in all cases at right angles to the plane in which the former lie, or to the optic meridian of the crystal.

284. The nebulous masses then, in all probability, originate in a regular laminated structure, perpendicular to the natural surface of the shell, and uniformly pervading all the coats of which it consists. The laminae, to agree with the above facts, must run parallel to each other, and in lines nearly straight along the whole surface, and the alternate ones at least must be regular crystals, having their optic meridians parallel to their own plane, and their optic axis (by which is meant the axis of symmetry in their spheroid of double refraction) perpendicular to the natural surface. The intermediate laminae, if composed of the same substance, must have their axes inclined to those of the former at some determinate angle. The grooved appearance above described may possibly arise from an actual difference in the resistance of these two sets of laminae to the action of the polishing particles, and therefore consist in a real difference of level; but this Mr. Herschel much doubts, from the simple fact, that he has never been able to transfer their impression to other transparent bodies, such as melted rosin, shell-lac, balsam of Tolu, &c., though in all cases the first set of grooves, however fine, has been transferred with the utmost fidelity, and the 7700th part of an inch, though a very minute quantity to our senses, appears to him enormously too wide to oppose the free introduction of a fluid under such circumstances. It is more probable that the appearance is a mere optical illusion, though a most complete one, arising from the difference of action of the contiguous surfaces on the light transmitted from below.

285. The regularity of structure here supposed is not at all incompatible with the irregular and arbitrary disposition of the grooves described by Dr. Brewster. These are the intersections of the plain artificial surface with the thin coats deposited in succession by the living animal, which, though laid symmetrically on each other, like the laminae of mica, have yet a slight degree of irregular curvature, and a small and varying inclination to the polished face. Their form and breadth is regulated by this curvature and inclination, like the level lines traced by a receding tide on a slightly inclined sea-beach, or those on the surface of a wooden board, where its concentric layers rise in succession at different angles to the surface. Indeed, the face of an ordinary deal plank, cut at some distance from the centre of the tree, however coarse the simile

may appear, when smoothed by planing and afterwards subjected to the friction of rough particles, as in a floor, is a lively and faithful representation of the surface of a polished plate of mother-of-pearl, in which the edges of the laminae reduced to the utmost tenuity, by the effect of their inclination to the general surface, are torn up in their direction of least resistance, by the action of the polishing particles. This is rendered perfectly evident by the microscopic examination of the surface in different stages of its progress, from the rough grinding to the most perfect polish, when the grooves, from an irregular, jagged, and deeply indented outline, will be seen to assume a greater and greater neatness of termination, till their curvature acquires that graceful and flowing character which ultimately distinguishes them.

286. The remarkable phenomena to which we now propose to direct the attention of our readers, while they possess all the interest which belongs to them as physical facts, have attached to them another kind of interest not less deserving of attention. To those who are in the practice of exercising a presumptuous confidence in their own judgments, and who trust in the indications of their senses as infallible guides, we would recommend the particular study of this class of deceptions. They will here find their judgments deluded, where every thing is favorable to the discovery of the truth; and even when they are aware of the source of the deception they will find themselves again brought under its dominion, and again released from it, by the operation of the most trivial circumstances which they are not able to discover, and the influence of which, if they do discover them, they are not able to appreciate. If all this takes place in matters of simple observation, where the senses of sight and of touch are allowed their undisturbed exercise, how much more liable must they be to error where their passions, their prejudices, or their feelings, concur in promoting the delusion, or even in any remote degree prepare the mind for its reception!

287. The class of deceptions to which we allude were, so far as we know, first noticed at one of the early meetings of the Royal Society of London, when a compound microscope, on a new construction, was exhibited. When the members were looking through it at a guinea, some of them saw the head upon the coin depressed, while others considered it to be raised, as it was in reality.

288. This deception was studied by Dr. Philip Frederick Gmelin, of Wirtemberg, who communicated the following observations upon it to the Royal Society in 1774:—

289. 'Being informed by a friend,' says he, 'that if a common seal was applied to the focus of a compound microscope, or optical tube, which has two or three convex or plano-convex lenses, that part which is cut the deepest in it would appear very convex, and so on the contrary; and that sometimes, but very seldom, it would appear in the same state as to the naked eye. I was desirous to make the observation myself, and found it constantly to happen as my friend told me. I thought the experiment worthy of being farther prosecuted; and accordingly on the 16th

of April, the morning not being very clear, but in a pretty light chamber, I viewed a watch hanging against a plain wall through the optical tube; the whole of it appeared concave, and fixed into the wall. I also observed some flies that were running about the wall, and they appeared in like manner. I also viewed a small globe of a thermometer filled with red spirit, and this also seemed hollow, and fixed within the frame. I found the same to happen with the round parts of garments of all colors, and with the brazen protuberances of a small cabinet; all which appeared concave, and deeply sunk into the cloth and wood. I also viewed a small stag's head cut in wood, and hanging horizontally on the wall; this also appeared concave, and fixed into the wall.

290. 'After this I observed a ball of Fahrenheit's thermometer, full of quicksilver: but it did not change its natural convexity, nor did the empty glass ball of the inverted thermometer hanging against the wall, though the lower ball of the same, filled with red spirit, and that also of Fahrenheit's filled with spirit, lost their convexity. Hence I presently concluded that white or shining uncolored bodies appear under the focus of this tube in the same manner as they appear to the naked eye; at the same time I must fairly acknowledge that an assisting friend has sometimes made observations directly opposite to mine in the same circumstances; nay, in a darker day, I myself have found my observations quite contrary to those I had made the day before. Hence, though the observations with the seal held constantly the same, I imagined there must be some particular circumstances hitherto undiscovered in which these objects appear thus perverted. I therefore endeavoured to discover some certain laws, according to which these perverted objects appeared when exposed to these foci, and some others according to which they constantly appeared as when they were exposed to the naked eye. After various experiments I partly obtained my end.

291. 'As often as I viewed any object rising upon a plane, of what color soever, provided it was neither white nor shining, with the eye and optical tube directly opposite to it, the elevated parts appeared depressed, and the depressed parts elevated, as it happened in the seal, as often as I held the tube perpendicularly, and brought it in such a manner that its whole surface almost covered the last glass of the tube; and in like manner it happened under the compound microscope. But as often as I viewed any of the other objects depending perpendicularly from a perpendicular plane in such a manner that the tube was supported in a horizontal situation directly opposite to it, the same always happened and the appearance was not altered when the object hung obliquely or even horizontally. I was mightily delighted with the observation of a tobacco-pipe, which had a porcelain bowl of a snowy whiteness, and a tube of horn almost black, and hung obliquely from a beam; the bowl preserved its natural convexity, and the tube was deeply sunk, and seemed to be almost immersed in the wall. I also observed that, when I placed the watch horizontally upon a horizontal plane, and then

looked on it perpendicularly, near the window, it no longer appeared so depressed, and surrounded with a shady ring; whence I began to suspect that all these fallacies were owing to shade, just as painters can elevate or depress a figure by making the ground lighter or deeper. Thus when the raised object was so placed between the windows that it must be illuminated on all sides, it did not change its convexity. But at last I discovered a method of making objects appear always with their natural convexity. If any object hung against a wall, or was contiguous to it in any situation whatsoever, I viewed sideways, in such a manner as not to oppose the tube directly against it, but below the eminence near the plain at some distance. By those means the protuberance of the instrument and other objects always appeared to me of their true natural convexity. With regard to the seal I held it in such a manner that the whole circumference was perpendicular, or rather a little inclined. Then I applied the lower side of the tube exactly to the upper margin of the disc of the seal, so that the tube formed an obtuse angle with the seal; then, carefully preserving the same situation, I very gently raised the tube from the rim of the seal upon its face; and then I always saw the seal with its true natural face. But why all these things happen exactly after the same manner I do not pretend to determine; nor why white or uncolored transparent bodies, rising in any manner above any plain, afford an exception from that rule of vision, and do not appear depressed when viewed after the method above-mentioned.'

292. In the year 1780 this subject occupied the attention of David Rittenhouse, president of the American Philosophical Society, who gave a correct explanation of the illusion, by referring it to the inversion of the shadow by the eye-tube. He employed in his observations an eye-piece, having two lenses placed at a distance greater than the sum of their focal distances; and by throwing a reflected light on the cavities observed, in a direction opposite to that of the light which came from his window, he was able to see them raised into elevations by looking through a tube without any lenses. Mr. Rittenhouse also observed that, by putting his finger into the cavity, the illusion ceased to take place.

293. Having thus given a brief detail of the experiments of Gmelin and Rittenhouse we shall proceed to explain more minutely the principles on which this illusion depends. It will afterwards be seen that inverting telescopes and microscopes are not necessary to the production of this illusion; but it may be best seen by viewing with the eye-piece of an achromatic telescope the engraving upon a seal when illuminated either by a candle or the window of an apartment. This eye-piece inverts the objects to which it is applied like the compound microscope, and the excavations or depressions of the seal are immediately raised up into elevations like a cameo, or a bas-relief. The cause of this illusion will be understood from fig. 7, where A represents a spherical cavity illuminated by a candle C. The shadow of the cavity will of course be on the left side S, and, therefore, if we view it through an inverting eye-piece or microscope, the cavity

will be seen as at A, fig. 8, with its shadow on the right hand S of the cavity. As the candle C remains where it was, the observer instantly concludes that what was formerly a cavity must now be a spherical elevation or segment of a sphere, as nothing but a raised body could have its shadow on the right hand S. If a second candle is now placed on the right hand side of A, so that it is between two candles, and is equally illuminated by both, the elevation will again sink into a cavity, as in fig. 9.

294. If the object A, in place of being a cavity, is actually the raised segment of a solid sphere, the same phenomena will be observed, the inverting eye-piece converting it into a cavity. These two experiments may be made most successfully with a seal, and an impression taken from it.

295. It cannot therefore be doubted that the optical illusion of the conversion of a cameo into an intaglio, and of an intaglio into a cameo, by an inverting eye-piece, is the result of an operation of our own minds, whereby we judge of the forms of bodies by the knowledge we have acquired of light and shadow. The greater our knowledge is of this subject, the more readily does the illusion seize upon us; while, if we are but imperfectly acquainted with the effects of light and shadow, the more difficult is it to be deceived. If the hollow is not polished, but ground, and the surface round and of uniform color and smoothness, almost every person, whether young or old, will be subject to the illusion; but, if the object is the raised impression of a seal upon wax, we have often found that, when viewed with the eye-piece, it still seemed raised to the three youngest of six persons, while the three eldest were subject to the deception. By such trifling and often unappreciable circumstances is our judgment affected, that the same person at one moment sees the convexity raised, and at another time depressed, though viewed as nearly as possible under the same circumstances. This remarkable effect no doubt arises from the introduction of some casual reflected lights which the slightest change of position will produce.

296. Having thus seen how our judgment concerning elevations and depressions is affected by our degree of knowledge of the effects of light and shade, and by unappreciable causes, we shall proceed to consider how our judgment is again deceived by the introduction of new substances.

297. Let the depression A, illuminated by one candle as in fig. 7, be converted into an elevation as in fig. 8, by the application of an inverting eye-piece; then if another candle C', fig. 9, is introduced so as to illuminate the depression A in the same manner, and with nearly the same intensity as C does, the elevation will fall down into a depression. The cause of this is obvious: the application of the inverting eye-piece produces no effect whatever, for both the sides of the cavity are symmetrically illuminated. In moving round the second candle C' from its position C', so as to stand beside C, it is curious to observe the progress of the deception by which the depression is again changed into an elevation.

298. If, when the depression A, fig. 10, is converted into an elevation, we introduce a small

unpolished opaque body M, and place it either beside the hollow or in it, so that the body M, and its shadow *m*, may be distinctly seen by the microscope, we shall have the appearance shown in fig. 11, the elevation having sunk into a depression. This correction of the depression arises from the introduction of a new illusion, namely, that which arises from the shadow *m*; for it is evident that, as the body M appears to project its shadow in the direction M *m*, the luminous body must be supposed to be on the same side D; and the evidence that this is the case is more powerful than our knowledge that the candle is actually at C, because it co-exists along with our perception of the depression A, whereas our knowledge of the situation of the candle is an act of recollection.

299. This correction of the delusion may be effected in another manner, which is perhaps more complete. If, in place of the unpolished body, we use a pin with a highly polished head, as shown at M, fig. 12, and then apply the inverting eye-piece, we shall have the effect shown in fig. 13, the cavity A appearing depressed. The image *s* of the candle C, being seen by reflection in the polished head of the pin M, is seen by the application of the eye-piece at *s*, on the right hand side of M in fig. 13, so that we immediately conceive, in opposition to our previous knowledge, that the candle must be at D; and hence the elevation falls into a depression the moment the pin head is pushed up into the field of view. The shadow M *m* has also its influence in the present case.

300. The next case in which this illusion is dispelled is when the sense of touch corrects the deduction formed through the medium of sight. Let the cavity A be raised into an elevation by the inverting eye-piece, as in fig. 8. Then if the cavity is sufficiently deep, and if we place the point of our finger in the cavity, the evidence which this gives us of its being a depression is superior to the evidence of its being a cavity arising from the inversion of the shadow; the apparent elevation will of course sink into a depression; but the moment the finger is withdrawn it will again rise into an elevation. If the cavity is a long groove, the part not touched by the finger will appear elevated, while the part touched by it will appear depressed.

301. Having thus considered some of the principal phenomena arising from the inversion of the object, we shall now proceed to explain some analogous facts which are owing to the semi-transparency of the body. If MN, fig. 14, is a plate of mother-of-pearl, and A a cavity ground or turned in it; then if this cavity is illuminated by a candle C, or by a window at C, in place of their being a shadow at the side *s*, as there would have been had the body been opaque, there is a quantity of refracted light seen along the whole side *s* next the candle. The consequence of this is that the cavity appears as an elevation when seen only by the naked eye, as it is only an elevated surface that could have the side *s* illuminated. The fact which we have now stated is a very important one, in so far as it may affect the labors of the sculptor. In some kinds of marble the transparency is so great that

the depressions and elevations in the human face cannot be represented by it with any degree of accuracy; and consequently transparent marble ought never to be used for works of any importance.

302. Illusions arising from the same cause may be observed even when the surface of the object is perfectly plain and smooth. If MN , fig. 15, is the surface of a mahogany table, MN a section of it, and abc a section of a knot in the wood, then it often happens, from the transparency of the thin edge at a , next the candle, that that side is illuminated while the opposite side at c is dark, the eye being placed in the plane of the section abc . The consequence of this is that the spot abc appears to be a hollow in the table.

303. Hence arises the appearance in certain plates of agate, which has obtained for it the name of hammered agate. The surface on which these cavities appears is a section of small spherical aggregations of siliceous matter like abc in fig. 15, which present exactly the same phenomenon, arising from the same cause as the knots in mahogany and other woods.

304. The very same phenomenon is, as we have already stated, often seen in mother-of-pearl. Indeed it is so common in this substance that it is almost impossible to find a mother-of-pearl counter which seems to have its surface flat, although they are perfectly so when examined by the touch. Owing to the refraction of the light by the different growths of the shell lying in different planes, the flattest surface seems to be unequal and undulating.

305. Dr. Brewster states that one of the finest deceptions which he ever met with, arising from the disposition of light and shadow, presented itself on viewing through a telescope the surface of a growing field of corn, illuminated by the sun when near the horizon. This field, on Sir Walter Scott's estate at Abbotsford, was about two miles distant, and was divided into furrows, which were directed to the eye of the observer, as shown in fig. 16, where AB , CD , EF , represent the furrows. These furrows are of course depressed, and the growing corn rises gradually from two adjacent ones towards the middle mn , op , so that the surfaces $A m C$, $C o E$, were convex. The drills of corn on the highest summits mn , op , caught the rays of the setting sun, which shone upon them very obliquely in the direction Ss , and illuminated their summits laterally, while the furrows AB , CD , EF , were in shadow. The consequence of this disposition of the light and shade was, that the whole field seemed to be trenched, and the corn to be growing in the trenches as well as upon the elevated beds between them. The half furrow $A B n m$, being shaded on its edge AB , and illuminated on its edge mn , became the elevated part of the trenched ground, while the other half $m n C D$ appeared the sunk part, in consequence of the side mn being illuminated, and its other side $C D$ in shade. At a certain period of the day this deception did not take place, and it was dispelled the moment the sun had set. The telescope had no effect whatever in producing it, as it showed objects erect.

306. An illusion of an analogous nature Dr. Brewster once observed when looking at the abbey church of Paisley, where the clustered columns of a Gothic pillar all sunk into hollow flutings. The cause of this deception was not discovered, but it must have arisen from some mistaken notion respecting the direction in which the object was illuminated.

307. The last species of illusion of this nature, and perhaps the most remarkable of all of them, may be produced by a continued effort of the mind to deceive itself. If we take one of the intaglio moulds used for making bas-reliefs, and direct the eye steadily to it without noticing surrounding objects, we may entice ourselves into the belief that the intaglio is actually a bas-relief. It is difficult at first to produce the deception, but a little practice never fails to accomplish it. Dr. Brewster states that he has succeeded in carrying this deception so far as to be able, by the eye alone, to raise a complete hollow mask of the human face into a projecting head. In order to do this we must exclude the vision of other objects: and also the margin or thickness of the cast.

308. The phenomena arising from *atmospheric refraction* may be best understood by an examination of the apparent alteration in the colors of the heavens.

309. If the light of the setting-sun, by passing through a long tract of air, be divested of a portion of its rays, the remainder, which is transmitted, will illuminate the western clouds with an orange color, and as the sun sets more and more, a great number are reflected, while the clouds grow more deeply red, till at length the entire disappearance of the sun leaves them of a leaden hue.

310. When a direct spectrum is thrown on colors darker than itself, it mixes with them; as the yellow spectrum of the setting-sun, thrown on the green grass, becomes a greener yellow. But, when a direct spectrum is thrown on colors brighter than itself, it becomes instantly changed into the reverse spectrum, which mixes with those brighter colors. So the yellow spectrum of the setting sun thrown on the luminous sky becomes blue, and changes with the color or brightness of the clouds on which it appears. But the reverse spectrum mixes with every kind of color on which it is thrown, whether brighter than itself or not: thus, the reverse spectrum obtained by viewing a piece of yellow silk, when thrown on white paper, was a lucid blue-green; when thrown on black Turkey leather became a deep violet: and the spectrum of blue silk, thrown on white paper, was a light yellow; on black silk was an obscure orange; and the blue spectrum obtained from orange-colored silk, thrown on yellow, became a green.

311. Of the natural phenomena produced occasionally by the separation of the primary colors the rainbow is one of the most beautiful. This meteor, which in poetical language is called the iris, never makes its appearance except when the spectator is situated between the sun and a shower of rain; and that this conclusion is just any one may satisfy himself by the following experiment:—Fill a hollow glass globe with water, and suspend it in the sun, in such a

manner that it may be raised or lowered at pleasure; at a certain height above the eye of the spectator, who looks at it with his back to the sun, the globe will appear to be red; let it then be slowly lowered, and it will appear to be orange, and afterwards, in succession, as it descends, it will appear yellow, green, blue, indigo, and violet. Hence the same drop of rain, which must be considered as a little globe, supplies all the seven colors to the eye. There are sometimes two rainbows seen at the same time, one within the other, and, what may seem remarkable, the order of the colors of the exterior bow is the reverse of that of the interior one. When two bows are seen, the exterior one is comparatively faint, and it is, therefore, sometimes called the false or secondary bow; while the greater distinctness of the interior one has obtained for it the appellation of the primary bow. The rainbow was one of those phenomena which astonished and perplexed the ancients; and, after many absurd and unsuccessful conjectures, their best philosophers, Pliny and Plutarch, relinquished the enquiry as one which was above the reach of human investigation. In the year 1611 Antonio de Dominis made a considerable advance, however, towards the theory of the rainbow, by suspending a glass globe in the sun's light, when he found that, while he stood with his back to the sun, the colors of the rainbow were reflected to his eye in succession by the globe, as it was moved higher or lower. He was, however, unable to account for the production of the different colors, as the experiments with the prism had not yet been made, and it was reserved for Newton to perfect the discovery.

312. To trace the progress of a ray of light through a drop of rain in each of these bows, will explain the cause of their differing in brightness. In the true or primary bow, the rays of light arrive at the spectator's eye, after two refractions and one reflection.

313. Thus, let *A*, in plate V. fig. 1, be a drop of rain, and *S* a ray from the sun falling on the upper part of the drop. It will suffer a refraction, and, instead of going forward in a right line, it will be bent to *n*; at *n* part of it will emerge, but the remainder will be reflected to *g*; at *g* it will be again refracted on passing into the air towards the eye at *h*; being thus twice refracted and once reflected, the ray is separated into its primitive colors; the red part, which is least thrown out of its course, makes an angle, at its emergence, with the incident solar ray of $40^{\circ} 2'$, as *Sfh*; and the violet, being the most easily thrown out of its course, makes with the solar light an angle of $40^{\circ} 17'$. The different colors, therefore, at the distance of the spectator, are considerably separated, and affect the eye in succession with the seven colors; but the succession is so quick, and so many drops fall through the same circuit in the same time, that the mind loses the idea of succession, and the bow seems permanent as long as the shower continues in a proper direction for the eye.

314. The exterior or secondary bow is formed by two reflections and two refractions. Let *B* represent one of the drops of rain forming this bow; a ray, *T*, from the sun, falling upon it at

r, is refracted, and falls upon the back of the drop at *s*; from the transparency of the drop a portion of it passes through towards *w*, but the remainder of it is reflected towards *t*; here again, for the same reason as before, part of it emerges from the drop, in the direction *x*, but the portion still left is reflected to *u*, where it is refracted towards the spectator, with the red rays uppermost. The great quantity of light lost at each reflection is the cause of the indistinctness of this bow, and therefore we cannot be surprised that we rarely, if ever, see bows formed by a still greater number of reflections within the drops; for, though they may exist, they are too faint to be seen. The secondary bow cannot be seen when the elevation of the sun is above $54^{\circ} 7'$, and it is broader than the interior bow, because the rays are more dispersed before they reach the eye.

315. The marine or sea bow is a phenomenon sometimes observed in a much agitated sea; when the wind, sweeping part of the tops of the waves, carries them aloft, so that the sun's rays falling upon them, are refracted, &c., as in a common shower, and paint the colors of the bow.

316. Rohault mentions colored bows on the grass, formed by the refraction of the sun's rays in the morning dew. Dr. Langwith, indeed, once saw a bow lying on the ground, the colors of which were almost as lively as those of the common rainbow. It was extended several hundred yards, and was not round, but oblong, being as he conceived the portion of an hyperbola. The colors took up less space, and were much more lively in those parts of the bow which were near him than in those which were at a distance.

317. We may now notice a peculiar perspective appearance of aerial light and shade. It occurred on the evening of August 19th, 1826; and was observed from the undercliff at the back of the Isle of Wight, just above Puckaster Cove. The sky was clear; the sun had just set to those who were standing where the appearance was observed; when several enormous rays of light and shade were remarked towards the east, north-east, and south-east, all radiating in straight lines from a spot rather south of east, and just upon the horizon. They were ten or twelve in number, did not join at the place whence they appeared to originate, but seemed to emerge from an obscure portion of surface of a convex form, 8° or 9° in horizontal extent, and about the third of that in height. The rays extended from 30° to 40° on the right and left from the centre, but were of less extent as they became more vertical. They diminished gradually in intensity at the extremities, until they could be traced no farther. The appearance slowly faded away, some of the rays disappearing before others, but was observed upon the whole for about half an hour.

318. At first the phenomenon seemed inexplicable, but after a little consideration was referred (and as it appeared from after observations correctly) to an effect of aerial perspective. The rays which seemed to originate from a common centre on the east were really only the intervals between long shadows caused by the

occurrence of clouds far to the west, and were in fact passing to the place whence they seemed to originate; and the circumstances of the case seem to have been as follow:—the atmosphere contained a slight haze, which allowed the sun's beams to pass forward with but little interruption, but was yet in sufficient quantity to reflect a considerable portion of light to the eye. The sun was just setting; the clouds very far to the west, and out of sight from the place where the observer stood, stopped the light wherever they interfered, and cast immense horizontal, or nearly horizontal, shadows along the sky, parallel to each other, and over the head of the observer. The difference between these shadows and the intervening illuminated parts could not be observed over head, or on the right or left hand, i. e. perpendicular to their direction, because of the want of sufficient depth, as it were, in the parts thus circumstanced, to make them visible; but, as they receded from the observer in the direction from the sun, they became fore-shortened, and then from the greater depth of mass, and consequently greater number of particles looked at, became visible. This is at least one reason why they were so visible towards the east; but another is the probable existence of more haze in that direction than towards the west, or to the right or left of the observer's situation: the rays could not be seen between the sun and the observer, though the sun was out of sight, and consequently the general light, it may be supposed, not too great; which seems to imply that less haze existed in that direction; and its presence was fully proved towards the east by the dull red color which the moon assumed upon rising a short time after the appearance had ceased. The convergence of the rays to one spot, and that opposite the sun, was merely an effect of perspective, and requires no explanation here.

319. Although the appearance on this evening was exceedingly beautiful and rare, and the more striking from the absence, to the observer, of the sun or clouds, and the complete insulation of the phenomenon, yet by close observation, upon other evenings, it was found that partial effects of the same kind were very common; and, from the manner in which these could be observed, the explanation above given fully confirmed. On several evenings after, when observing the sun set from the neighbouring hill of St. Catherine, it was found that if the atmosphere was generally clear, but with compact and distinctly-formed clouds floating in it, the effect was produced. The usual appearance of rays at sunset, diverging amongst the clouds in the west, from the sun, is well known; but, even when these were not visible, upon looking to the eastern half of the hemisphere, and especially to the north or south of east towards the horizon, it was rarely that some clouds could not be distinguished, with long shadowy projections behind them, always converging to the spot opposite to the sun. Frequently, clouds could be selected moving more immediately in the neighbourhood of the observer: of those which passed overhead the shadows could not be observed close to the clouds; but, carrying the eye onwards

towards the east, the same shadows became visible, when considerably fore-shortened, and could be observed moving on and changing with the clouds themselves. All these phenomena, with their variations, were easily referrible to their causes, and may be observed at almost any sun-set in fine weather; but the effect of the first evening, so similar in kind, though so different in appearance, was not again remarked. It is with a view of guarding persons who may observe the same effect, against any mistake as to its origin, that the appearance, with its nature, has been thus particularly described.

320. The elevation of coasts, ships, and mountains, above their usual level, when seen in the distant horizon, has been long known and described under the name of *Looming*. The name of mirage has been applied by the French to the same class of phenomena; and the appellation of Fata Morgana has been given by the Italians to the singular appearances of the same kind which have been repeatedly seen in the straits of Messina. See FATA MORGANA.

321. The phenomena of the mirage are most frequently seen in the case of ships when they are just beginning to appear above the visible horizon. Mr. Huddart, Dr. Vince, and captain Scoresby, have described various appearances of this kind, of which the following are the most interesting:—

322. On the 1st of August, 1798, Dr. Vince observed at Ramsgate a ship which appeared as at A, fig. 2, the top mast being the only part of it that was seen above the horizon. An inverted image of it was seen at B immediately above the real ship A, and an erect image at C, both of them being complete and well defined. The sea was distinctly seen between them as at *vw*. As the ship rose to the horizon the image C gradually disappeared, and while this was going on the image B descended, but the mainmast of B did not meet the mainmast of A. The two images BC were perfectly visible when the whole ship was actually below the horizon.

323. While navigating the Greenland Sea on the 28th of June, 1820, captain Scoresby observed about eighteen or nineteen sail of ships at the distance of from ten to fifteen miles. He saw them from the mast head, beginning to change their form. One was drawn out, or elongated, in a vertical plane; another was contracted in the same direction; one had an inverted image immediately above it as at *a* fig. 3, and two at *b* and *c*, had two distinct inverted images in the air: along with these images there appeared images of the ice, as at *b* and *c*, in two strata, the highest of which had an altitude of about 15'.

324. In a later voyage, performed in 1822, captain Scoresby was able to recognise his father's ship, when below the horizon, from the inverted image of it which appeared in the air. 'It was,' says he, 'so well defined, that I could distinguish by a telescope every sail, the general 'rig of the ship,' and its particular character; insomuch that I confidently pronounced it to be my father's ship, the *Fame*, which it afterwards proved to be; though, in comparing notes with my father, I found that our relative position at

the time gave our distance from one another very nearly thirty miles, being about seventeen miles beyond the horizon, and some leagues beyond the limit of direct vision. I was so struck by the peculiarity of the circumstance that I mentioned it to the officer of the watch, stating my full conviction that the *Fame* was then cruising in the neighbouring inlet.'

325. One of the most curious phenomena of this kind was seen by Dr. Vince on the 6th of August, 1806, at 7 P.M. To an observer at Ramsgate the tops of the four turrets of Dover castle are usually seen over a hill between Ramsgate and Dover. Dr. Vince, however, when at Ramsgate saw the whole of Dover castle as if it had been brought over and placed on the Ramsgate side of the hill. The image of the castle was so very strong and well defined, that the hill itself did not appear through the image.

326. In the sandy plains of Egypt the mirage is seen to great advantage. These plains are often interrupted by small eminences, upon which the inhabitants have built their villages, in order to escape the inundations of the Nile. In the morning and evening objects are seen in their natural form and position, but, when the surface of the sandy ground is heated by the sun, the land seems terminated at a particular distance by a general inundation; the villages which are beyond it appear like so many islands in a great lake, and between each village an inverted image of it is seen.

327. Our limits will not permit us to give any farther examples of these curious phenomena. We shall therefore attempt to give a popular explanation of their cause.

328. Let *SH*, fig. 4, be a ship in the horizon, and visible to the eye at *E*, by rays *SE*, *HE*, proceeding in straight lines to *E*, through a tract of the atmosphere in its usual state. If we suppose, what is known to be sometimes the case, that the refractive power of the atmosphere, or air, above the line *SAE* varies, so as to be less at *c* than at *a*, then rays *Sc*, *Hc*, proceeding upwards from the ship, and that never could in the ordinary state of the air reach the eye at *E*, will be refracted into curve lines *Hc*, *Sc*; and, if the variation of refractive power is such that these last rays cross each other at *x*, then the ray *Sc*, in place of being the uppermost, will now be the undermost, and consequently will enter the eye as if it came from the lower end of the object.

329. If we now draw lines *Es*, *Ek*, tangents to these curve lines at *E*, these lines will be the direction in which the ship will be seen by the rays *Hc*, *Sc*, and the observer at *E* will see an inverted image *sk* of the ship *SH* considerably elevated above the horizon. The refractive power of the air still continuing to diminish, other rays, *Hm*, *En*, that never could reach the eye at *E* in the ordinary state of the atmosphere, may likewise be bent into curves which will not cross each other before they reach the eye at *E*. In this case the tangent *Es* to the upper curve *SnE* will be uppermost, and the tangent *Ek* to the lower curve *SmE* lowermost, so that the observer at *E* will see an erect image *sk* of the ship above the inverted image. It is possible

that a third and even a fourth image may be seen.

330. If the variation of refractive power takes place only in the tract of air through which the rays *Hc*, *Sc*, pass, then there may only be an inverted image; and if it takes place only in the tract through which *Sm*, *Sn*, pass, there may only be an erect image. It is also obvious, that if the variation of refractive power commences at the line joining the eye and the horizon, the ordinary image *SH* will not be seen; and, in like manner, it is clear that the inverted and erect images *sk*, *sk'*, may be seen even if the real ship *SH* is below the visible horizon.

331. In the case of Dover Castle, the rays from the top and bottom of the castle passed above the hill in curve lines, and the top of the hill was seen by the observer at Ramsgate, by means of a curved ray which reached the eye between the rays of the top and bottom of the castle.

332. That the phenomena of the mirage are produced by such variations in the refractive power of the atmosphere as we have mentioned may be proved by actual experiment. All the phenomena may be represented artificially to the eye, and we may even venture to predict new phenomena which have not yet been witnessed. If the variation of the refractive power of the air takes place in a horizontal line perpendicular to the line of vision, that is, from right to left, then we may have a lateral mirage, that is, an image of a ship may be seen on the right or left hand of the real ship, or on both, if the variation of refractive power is the same on each side of the line of vision. If there should happen at the same time both a vertical and a lateral variation of refractive power in the air, and if the variation should be such as to expand or elongate the object in both directions, then the object would be magnified as if seen through a telescope, and might be seen and recognised at a distance at which it would not otherwise have been visible. If the refractive power, on the contrary, varied, so as to contract the object in both directions, the image of it would be diminished as if seen through a concave lens.

333. In order to represent artificially the effects of the mirage, Dr. Wollaston views an object through a stratum of spirit of wine lying above water, or a stratum of water laid above one of syrup: These substances, by their gradual incorporation, produce a refractive power diminishing from the spirit of wine to the water, or from the syrup to the water; so that by looking through the mixed, or the intermediate stratum at a word or object held behind the bottle which contains the fluids, an inverted image will be seen. The same effect Dr. Wollaston has shown may be produced by looking along the side of a red-hot poker at a word or object ten or twelve feet distant. At a distance less than three-eighths of an inch from the line of the poker, an inverted image was seen, and within and without that an erect image.

334. The method employed by Dr. Brewster to illustrate these phenomena consists in holding a heated iron above a mass of water bounded by parallel plates of glass; as the heat descends

slowly through the fluid, we have a regular variation of density which gradually diminishes from the bottom to the surface. If we now withdraw the heated iron, and put a cold body in its place, or even allow the air to act alone, the superficial stratum of water will give out its heat, so as to produce a decrease of density from the surface to a certain depth below it. Through the medium thus constituted the phenomena of the mirage may be seen in the finest manner.

335. We have no doubt that some of the facts ascribed in the Western Highlands of Scotland to second sight have been owing to the unusual refraction of the atmosphere, and that the same cause will explain some of those wonders which sceptics discredit, and which superstitious minds attribute to supernatural causes. The beacon keeper of the Isle of France, who saw ships in the air before they rose above the visible horizon, may now recover his good character in the eyes of the former, while the latter may cease to regard him as a magician.

336. Very beautiful effects resulting from the decomposition of white light are visible on the surface of the feathers of birds; and, as we have stated in a previous section, are also exhibited on the surface of mother-of-pearl. Dr. Brewster, while pursuing a series of experimental investigations on this subject, found, by the aid of the microscope, that they arose from grooves in the striated surfaces; that they were produced when the flat surface was unpolished, and that they could be communicated to wax, gum-arabic, tin-foil, the fusible metal, and even to lead, by hard pressure or the blow of a hammer. He determined also that the mottled colors upon all bodies with an imperfect polish, and the scratches or grooves upon polished metals, could be communicated to wax and other substances. The same structure which gives these communicable colors he succeeded in producing artificially on the surface of calves-foot jelly, that had been boiled a considerable time; and he discovered, with a powerful microscope, the same minute grooves which exist in mother-of-pearl, and they were so near one another that some thousands of them must have been contained in a single inch. These grooves were completely visible to the unassisted eye, but they gave in a very distinct manner the colors of mother-of-pearl.

337. Mr. Barton, of the mint, has succeeded in ornamenting steel and other articles, with the colors of striated surfaces, and of applying this principle to practical purposes.

338. In applying the principle of striated colors to ornament steel, the effect, or pattern, is produced upon the polished surface by the point of the diamond, so that either the whole or a part of the surface is covered with lines or grooves, whose distance may vary from the 1000th to the 10,000th of an inch. When these lines are most distant the prismatic images of the candle, or any luminous body, seen by reflection from the polished surface, are nearest one another, and the common colorless image; and, when the lines are least distant, the colored images are farthest from one another, and the colors are most vivid.

339. In daylight the colors produced by these

minute grooves are scarcely distinguishable, unless at the boundary between a dark and a luminous object. In sharp lights, however, and particularly in that of the sun, the colors shine with extraordinary brilliancy, and the beautiful tints which accompany every luminous image can only be equalled by their matchless exhibition on the reflections of the diamond.

340. The colors transmitted by plates of glass containing a film of air or water are well worth an attentive examination. The plates of reflection or transmission of the several colors in a series are so near each other that the colors dilute each other by mixture, whence the number of series in the open daylight seldom exceeds seven or eight: but if the system be viewed through a prism, by which means the rings of various colors are separated, according to their refrangibilities, they may be seen on that side towards which the refraction is made, so numerous that it is impossible to count them. Or if, in a dark chamber, the sun's light be separated into its original rays by a prism, and a ray of one uncompound color be received upon two glasses, the number of circles will become very numerous. In this experiment it is also seen that, in any series, the circles formed by the less refrangible rays exceed in magnitude those which are formed by the more refrangible rays, and consequently that, in any series, the more refrangible rays are reflected at less thicknesses than those which are less refrangible. If the light be incident obliquely, the rings of colors dilate and enlarge themselves; whence it follows that the thickness required to reflect the colors of any series is different in different obliquities.

341. When the solar rays are passed through a convex lens, or reflected from a concave, a very intense heat is produced by the concentration of the rays. Count Rumford has shown that when the rays of the sun are made to pass through a certain aperture, and fall upon any substance to be heated, while the same area of light is made to pass through a lens, in the focus of which the same quantity of matter is to be heated, they become heated in the same time to the same degree. Nothing is better known, in short, than that the rays of the sun are capable of exciting sensible heat. Newton, and the philosophers of his age, accounted for heat by the motion excited in the parts of the body by the agitating power of the absorbed light. Melville supposed that the heat was expelled from the terrestrial matter by the light. At present it is generally admitted, on the strength of some valuable experiments to which we have already alluded, that the rays of light and caloric are separately emitted from the sun, the luminous rays producing light, and the caloric, heat.

342. It was originally remarked by Newton, and the fact has since been confirmed by the experiments of Dr. Herschel, that the different-colored rays have not the same illuminating power. The violet rays appear to have the least luminous effect: the indigo more; and the effect increases in the order of the colors, the green being very great; between the green and yellow the greatest of all; the yellow the same as the green; but the red less than the yellow.

343. Sir William Herschel introduced a beam of light into a dark room, which was decomposed by a prism, and then exposed a very sensible thermometer to all the rays in succession, and observed the heights to which it rose in a given time. He thus determined that the heating power of the red, to that of the green rays, was two and three-quarters to one; and three and a half to one in red to violet.

344. On repeating these experiments he found that the greatest quantity of calorific rays were even beyond the colored spectrum at about half an inch from the commencement of the red rays. At a greater distance from this point it began to diminish, but was very perceptible even at the distance of an inch and a half.

345. It will appear, from what has been stated, that these calorific rays are less refrangible than the rays of light; hence the calorific focus will fall beyond that of the luminous. Dr. Herschel made an experiment to verify this inference, but did not come at any thing conclusive. He afterwards made experiments to collect these invisible calorific rays, and caused them to act independently of the light; by which he concludes that they are sufficient to account for all the effects produced by the solar rays in exciting heat; that they are capable of passing through glass, and of being refracted and reflected, after they have been finally detached from the solar beam.

346. Dr. Morichini appears to have been the first person to point out the connexion between light and magnetism. To experimentally illustrate this important fact, he employed a prism, and caused the decomposed rays to fall on a series of small needles, and the needle intersected by the violet ray was soon found to acquire permanent polarity. It has since been ascertained that this property is not peculiar to the violet ray, but extends, though in a less degree, through several other rays in the series.

347. Our present article was commenced with a few facts illustrative of the history of optics, when viewed in connexion with the theory of light; it may now be advisable to furnish similar data for a right understanding of the progress that has been made in the construction of *optical machines*.

348. The ancients were so little acquainted with the science of optics that they seem to have had no instruments of the optical kind, excepting the glass globes and speculums formerly mentioned, which they used in some cases for magnifying and burning. Alhazen gave the first hint of the invention of spectacles, and it is probable that they were found out soon after his time. From the writings of Alhazen, together with the observations and experiments of Roger Bacon, it is not improbable that some monks gradually hit upon the construction of spectacles; to which Bacon's smaller segment, notwithstanding his mistake concerning it, was a nearer approach than Alhazen's larger one. Whoever they were that pursued the discoveries of Bacon, they probably observed that a very small convex glass, when held at a greater distance from the book, would magnify the letters more than when it was placed close to them, in which position only Bacon seems to have used it. In the next

place, they might try whether two of these small segments of a sphere placed together, or a glass convex on both sides, would not magnify more than one of them. They would then find that two of these glasses, one for each eye, would answer the purpose of reading better than one; and, lastly, they might find that different degrees of convexity suited different persons.

349. It is certain that spectacles were well known in the thirteenth century, and not long before. It is said that Alexander Spina, a native of Pisa, who died in 1313, and who was very ingenious in executing whatever he saw or heard of as having been done by others, happened to see a pair of spectacles in the hands of a person who would not explain them to him; but that he succeeded in making a pair for himself, and immediately made the construction public, for the good of others. It is also inscribed on the tomb of Salvinus Armatus, a nobleman of Florence, who died in 1317, that he was the inventor of spectacles.

350. The use of concave glasses to help those persons who are shortsighted was probably a discovery that followed not long after that of convex ones for the relief of those whose sight is defective in the contrary extreme, though we find no trace of this improvement. From this time, though both convex and concave lenses were sufficiently common, yet no attempt was made to form a telescope, by a combination of them, till the end of the sixteenth century. Descartes considers James Metius, a person who was no mathematician, though his father and brother had applied to those sciences, as the first constructor of a telescope; and says that, as he was amusing himself with making mirrors and burning-glasses, he casually thought of looking through two of his lenses at a time, and that happening to take one that was convex and another that was concave, and happening also to hit upon a pretty good adjustment of them, he found that, by looking through them, distant objects appeared very large and distinct. In fact, without knowing it, he had made a telescope.

351. Others say that this great discovery was first made by John Lippersheim, a maker of spectacles at Middleburg, or rather by his children; who, like Metius, were diverting themselves with looking through two glasses at a time, and placing them at different distances from one another. But Borellus, the author of a book entitled *De vero Telescopii Inventore*, gives this honor to Zacharias Joannides or Jansen, another maker of spectacles at the same place, who made the first telescope in 1590; and it seems now to be the general opinion that this account of Borellus is the most probable. Indeed his account of the discovery of telescopes is so circumstantial, and so well authenticated, that it does not seem possible to call it in question. It is not true, he says, that this great discovery was made by a person who was no philosopher; for Zacharias Jansen was a diligent enquirer into nature; and, being engaged in these pursuits, he was trying what uses could be made of lenses for those purposes, when he fortunately hit upon the construction.

352. This ingenious mechanic and philosopher

had no sooner found the arrangement of glasses that produced the effect he desired than he enclosed them in a tube, and ran with his instrument to prince Maurice, who, immediately conceiving that it might be of use to him in his wars, desired the author to keep it a secret. But this was impossible; and several persons in that city immediately began to make and sell telescopes. One of the most distinguished of these was John Laprey, called Lippersheim by Sirturus. By him some person in Holland being very early supplied with a telescope, he passed with many for the inventor; but both Metius above mentioned, and Cornelius Drebell of Alémaer, in Holland, applied to the inventor himself in 1620; as did also Galileo, and many others. The first telescope made by Jansen did not exceed fifteen or sixteen inches in length; but Sirturus, who says that he had seen it and made use of it, thought it the best that he had ever examined.

353. Jansen, having a philosophical turn, applied his instrument to such purposes as he had in view when he hit upon the construction. Directing it towards celestial objects, he distinctly viewed the spots on the surface of the moon, and discovered many new stars, particularly seven pretty considerable ones in the Great Bear. His son, John Zacharias, noted the lucid circle near the limb of the moon, whence several bright rays seem to dart in different directions; and he says that the full moon, viewed through this instrument, did not appear flat, but was evidently spherical, the middle part being prominent. Jupiter also, he says, appeared round, and rather spherical; and sometimes he perceived two, sometimes three or four small stars, a little above or below him; and, as far as he could observe, they performed revolutions round him. This was probably the first observation of the satellites of Jupiter.

354. It may be proper to add, that Francis Fontana, an Italian, also claims the invention; but he did not pretend to have made it before 1608, and it is well known that the instruments were made and sold in Holland some time before.

355. Some say that Galileo was the inventor of telescopes; but he himself acknowledges that he first heard of the instrument from a German; but he says that being informed of nothing more than the effects of it, first by common report and a few days after by a French nobleman, J. Badovere, at Paris, he himself discovered the construction, by considering the nature of refraction: and thus he had much more real merit than the inventor himself. The account of what Galileo actually did in this business is circumstantially related by the author of his life, prefixed to the 4to. edition of his works, printed at Venice in 1744. About April or May, 1609, it was reported at Venice, where Galileo (who was professor of mathematics in the university of Padua) then happened to be, that a Dutchman had presented to prince Maurice of Nassau a certain optical instrument by means of which distant objects appeared as if they were near; but no farther account of the discovery had reached that place, though this was nearly twenty years after the first discovery. Struck, however, with this

account, Galileo instantly returned to Padua, considering what kind of an instrument this must be. The night following the construction occurred to him; and the day after, putting the parts of the instrument together, as he had previously conceived of it, and notwithstanding the imperfection of the glasses that he could then procure, the effect answered his expectation, as he acquainted his friends at Venice, to which place he six days afterwards carried another and a better instrument, and where, from several eminences, he showed to some of the principal senators of that republic a variety of distant objects, to their very great astonishment. When he had made farther improvements in the instrument, he made a present of one of them to the doge, Leonard Donati, and of one to each of the senators of Venice; giving along with the instrument a written paper, in which he explained the structure and wonderful uses that might be made of it both by land and at sea. In return, the republic, on the 25th of August, the same year, more than tripled his salary as professor.

356. Galileo, directing his tube towards the moon, found that the surface of it was diversified with hills and valleys, like the earth. He also discovered that the *via lactea* and nebulae consisted of a collection of fixed stars, which, on account either of their vast distance or extreme smallness, were invisible to the naked eye. He likewise observed innumerable fixed stars dispersed over the face of the heavens, which had been unknown to all the ancients: and, examining Jupiter with a better instrument than any he had made before, he found that he was accompanied by four stars, which performed periodical revolutions round him, and which, in honor of the Medici, he called Medicean planets. This discovery he made in January 1610, N. S., and in March he published an account of all his discoveries, in his *Nuncius Sidericus*, printed at Venice, and dedicated to Cosmo, great duke of Tuscany, who, by a letter dated 10th of July 1610, invited him to quit Padua, and assigned him an ample stipend, as primate and extraordinary professor at Pisa, but without any obligation to read lectures, or to reside. The extraordinary discoveries contained in the *Nuncius Sidericus*, which was quickly reprinted in Germany and France, were the cause of much debate among the astronomers; many of whom could not credit Galileo's account, while others ridiculed his discoveries as fictions or illusions. Some could not be prevailed upon even to look through a telescope; so devoted were they to the system of Aristotle. But, when it was found vain to oppose the evidence of sense, some affirmed that the invention was taken from Aristotle; and quoting his writings, in which he mentions stars seen in the day-time from the bottom of a deep well, said, that the well corresponded to the tube of the telescopes, and that the vapors which arose from it gave the hint of putting glasses into it; and that in both cases the sight is strengthened by the transmission of the rays through a thick and dark medium. Galileo himself, who tells this story, humorously compared such men to alchymists, who pretend that the art of making gold was known to the ancients, but lay concealed under the fables of the poets.

357. In July, 1610, Galileo being still at Padua, and getting an imperfect view of Saturn's ring, imagined that the planet consisted of three parts; and therefore, in the account which he gave of this discovery to his friends, he calls it *planetam terginam*. He also observed some spots on the face of the sun: but did not then publish his discovery; partly for fear of irritating the obstinate Aristotelians, and partly to make more exact observations on this remarkable phenomenon. He therefore contented himself with communicating his discovery to some of his friends at Padua and Venice, among whom was F. Paul. This delay, however, was the cause of this discovery being contested with him by the famous Scheiner, who likewise made the same observation in October 1611, and anticipated Galileo in the publication of it. About the end of August Galileo left Padua and went to Florence; and in November following he was satisfied, that from September Venus had been continually increasing in bulk, and that she changed her phases like the moon. About the end of March 1611 Galileo went to Rome, where he gratified the cardinals and the chief nobility with a view of the new wonders he had discovered in the heavens, and among others the solar spots. From these discoveries Galileo obtained the name of *Lynceus*, after one of the Argonauts, who was famous in antiquity for the acuteness of his sight; and the marquis of Monticelli instituted an academy, with the title of *Lincei*, and made him a member of it. Galileo enjoyed the use of his telescope twenty-nine years, continually enriching astronomy with his observations: but, by too close application during the nocturnal air, his eyes grew gradually weaker, till in 1639 he became totally blind; a calamity which, however, neither broke his spirits, nor interrupted the course of his studies. The first telescope that Galileo constructed magnified only three times; but soon after he made another which magnified eighteen times; and afterwards, with great trouble and expense, he constructed one that magnified thirty-three times: and with this he discovered the satellites of Jupiter and the spots of the sun.

358. Although Galileo had great merit with respect to telescopes, yet he did not explain the rationale of the instrument. This important service to science was performed by John Kepler, whose name is famous in the annals of philosophy, especially by his discovery of the great law of motion respecting the heavenly bodies; which is that the squares of their periodical times are as the cubes of their distance from the body about which they revolve; a proposition which, however, was not demonstrated before Sir Isaac Newton. Kepler was astronomer to several emperors of Germany; he was the associate of the celebrated astronomer Tycho Brahe, and the master of Descartes. He made several discoveries relating to the nature of vision; and not only explained the rationale of the telescopes which he found in use, but also pointed out methods of constructing others of superior powers and more commodious use. Kepler first gave a clear explanation of the effects of lenses in making the rays of a pencil of light converge or diverge. He showed that a plano-convex lens makes rays pa-

rallel to its axis to meet at the distance of the diameter of the sphere of convexity; but that, if both sides of the lens be equally convex, the rays will have their focus at the distance of the radius of the circle corresponding to that degree of convexity. But he did not investigate any rule for the foci of lenses unequally convex. To Cavalieri we owe this investigation. He laid down this rule: as the sum of both the diameters is to one of them, so is the other to the distance of the focus. All these rules concerning convex lenses are applicable to those that are concave; with this difference, that the focus is on the contrary side of the glass.

359. The principal effects of telescopes depend upon these plain maxims, viz. That objects appear larger in proportion to the angles which they subtend at the eye; and the effect is the same whether the pencils of rays by which objects are visible to us come directly from the objects themselves, or from any place nearer to the eye, where they may have been united so as to form an image of the object; because they issue again from those points where there is no real substance, in certain directions, in the same manner as they did from the corresponding points in the objects themselves. All that is effected by a telescope is, first to make such an image of a distant object, by means of a lens or mirror; and then to assist the eye in viewing that image as near as possible; so that the angle, which it shall subtend at the eye, may be very large compared with the angle which the object itself would subtend. This is done by an eye-glass, which so refracts the pencils of rays as that they may afterwards be brought to their several foci by the natural humors of the eye. If, instead of an eye glass, an object may be looked at through a small hole in a thin plate or piece of paper, held close to the eye, it may be viewed very near to the eye, and, at the same distance, the apparent magnitude of the object will be the same in both cases. But, as very few rays can be admitted through a small hole, there is seldom light sufficient to view an object to advantage in this way.

360. Such was the telescope first discovered and used by astronomers; and it is of a much more difficult construction than some other kinds that have been invented since. The great inconvenience attending it is, that the field of view is exceedingly small. For, since the pencils of rays enter the eye very much diverging from one another, but few of them can be intercepted by the pupil; this inconvenience increases with the magnifying power of the telescope, so that philosophers at this day cannot help wondering that it was possible, with such an instrument, for Galileo and others to have made the discoveries they did. It must have required incredible patience and address. No other telescope, however, than this, was so much as thought of for many years after the discovery. Descartes, who wrote thirty years after, mentions no others as actually constructed. To Kepler we are indebted for the invention of the astronomical telescope, the best adapted for viewing the heavenly bodies. The rationale of this instrument is explained, and the advantages of it are clearly pointed out, by this philosopher, in his *Catoptrics*; although he ne-

ver actually reduced his excellent theory into practice. Montucla conjectures that he was not aware of the great increase of the field of view, and that, being engaged in other pursuits, he might think it of no importance to construct an instrument which could do little more than answer the same purpose with those of which he was already possessed. Kepler's new scheme of a telescope was however soon executed. The first who made an instrument of this construction was F. Scheiner, who described it in his *Rosa Ursina*, published in 1630. It, says he, you insert two similar lenses (both convex) in a tube, and place your eye at a convenient distance, you will see all terrestrial objects inverted indeed, but magnified and very distinct, with a considerable extent of view. He subjoins an account of a telescope of a different construction, with two convex eye-glasses, which reverse the images, and make them appear in their natural position. This disposition of the lenses had also been pointed out by Kepler. F. Rheita soon after hit upon a better construction, using three eye-glasses instead of two. This was named the terrestrial telescope, being chiefly used for terrestrial objects.

361. The first and last of these constructions are those which are now in common use. The proportion in which the first telescope magnifies is as the focal length of the object-glass to that of the eye-glass.—The only difference between the Galilean telescope and the other is, that the pencils by which the extremities of any object are seen in this case enter the eye diverging; whereas, in the other, they enter it converging; but, if the sphere of concavity in the eye-glass of the Galilean telescope be equal to the sphere of convexity in the eye-glass of another telescope, their magnifying power will be the same. The concave eye-glass however, being placed between the object-glass and its focus, the Galilean telescope will be shorter than the other by twice the focal length of the eye-glass. Consequently, if the length of the telescopes be the same, the Galilean will have the greater magnifying power. The invention of the telescope and microscope having incited mathematicians to a more careful study of dioptrics, and this having soon become almost a perfect science, by the discovery of Snellius, many different constructions were offered to the public. Huygens was particularly eminent for his systematic knowledge of the subject, and is the author of the chief improvements which have been made on all the dioptrical instruments till the time of Mr. Dollond's discovery. He was well acquainted with the theory of aberration arising from the spherical figure of the glasses, and has showed several ingenious methods of diminishing them by proper constructions of the eye-pieces. He first showed the advantages of two eye-glasses in the astronomical telescope and double microscope, and gave rules for this construction, which both enlarges the field and shortens the instrument. Mr. Dollond adapted his construction to the terrestrial telescope of Rheita; and his five eye-glasses are nothing but the Huygenian eye-piece doubled. This construction has been too hastily given up by the artists of the present day for another, also

of Mr. Dollond's, of four glasses. Vision is more distinct in the Galilean telescope than in the other, owing perhaps in part to there being no intermediate image between the eye and the object. Besides, the eye-glass being very thin in the centre, the rays will be less liable to be distorted by irregularities in the substance of the glass. Whatever be the cause, we can sometimes see Jupiter's satellites very clearly in a Galilean telescope not more than twenty or twenty-four inches long: when one of four or five feet, of the common sort, will hardly make them visible.

362. F. Rheita also invented a binocular telescope, which F. Cherubin of Orleans endeavoured to bring into use. It consists of two telescopes fastened together, and made to point to the same object. When this instrument is well fixed, the object appears larger and nearer to the eye, when it is seen through both the telescopes, than through one of them only, though they have the very same magnifying power. But this is only an illusion, occasioned by the stronger impression that two equal images, equally illuminated, make upon the eye. This advantage, however, is counterbalanced by the inconvenience attending the use of it.

363. The first who distinguished themselves in grinding telescopic glasses were two Italians, Eustace Divini at Rome, and Campani at Bologna, whose fame was much superior to that of Divini, or that of any other person of his time; though Divini pretended that in all the trials that were made with their glasses, his of a great focal distance performed better than those of Campani, and that his rival was not willing to try them fairly, viz. with equal eye-glasses. Campani, however, really excelled Divini, both in the goodness and the focal length of his object-glasses. It was with telescopes made by Campani that Cassini discovered the nearest satellites of Saturn. They were made by the express order of Louis XIV., and were of eighty-six, 100, and 136 Parisian feet focal length. Campani sold his lenses at a high price, and took every possible method to keep his art a secret. His laboratory was inaccessible till after his death; when it was purchased by pope Benedict XIV., who made a present of it to the Institute of that city; and, by the account which M. Fougeroux has given of what he could discover from it, we learn, that (except a machine, which M. Campani constructed to work the basins on which he ground his glasses) the goodness of his lenses depended upon the clearness of his glass, his Venetian tripoli, the paper with which he polished his glasses, and his great skill and address as a workman. He made few lenses of a very great focal distance; and having the misfortune to break one of 141 feet in two pieces, he took incredible pains to join the two parts together, which he did at length effectually, so that it was used as if it had been entire.

364. Sir Paul Neille, Dr. Hooke says, made telescopes of thirty-six feet, pretty good, and one of fifty. Afterwards Mr. Reive, and then Mr. Cox, who were the most celebrated in England as grinders of optic glasses, made some good ones of fifty and sixty feet focal distance, and

Mr. Cox made one of 100. Borelli also, in France, made object-glasses of a great focal length, one of which he presented to the Royal Society. With respect to the focal length of telescopes, these and all others were far exceeded by M. Auzout, who made one object-glass of 600 feet focus; but he was never able to make any use of it. Hartsoeker is even said to have made some of a still greater focal length; but this ingenious mechanic, finding it impossible to make use of object-glasses the focal distance of which was much less than this, when they were enclosed in a tube, contrived a method of using them without a tube, by fixing them at the top of a tree, a high wall, or the roof of a house.

365. Mr. Huygens also made considerable improvements in the method of using an object-glass without a tube. He placed it at the top of a very long pole, having previously enclosed it in a short tube, which was made to turn in all directions by a ball and socket. The axis of this tube he could command with a fine silken string so as to bring it into a line with the axis of another short tube which he held in his hand, and which contained the eye-glass. He thus could use object-glasses of the greatest magnifying power, at whatever altitude his object was, and even in the zenith, provided his pole was as long as his telescope; and, to adapt it to the view of objects of different altitudes, he had a contrivance by which he could raise or depress a stage that supported his object-glass at pleasure.

366. M. Auzout, in a paper read before the Royal Society, observed that the apertures which the object-glasses of refracting telescopes can bear with distinctness are in about a sub-duplicate proportion to their lengths; and upon this supposition he drew up a table of the apertures proper for object-glasses of a great variety of focal lengths, from four inches to 400 feet. Upon this occasion Dr. Hooke observed that the same glass will bear a greater or less aperture, according to the less or greater light of the object. If, for instance, he was viewing the sun, or Venus, or any of the fixed stars, he used smaller apertures; but if he wanted to view the moon by day light, or Saturn, Jupiter, or Mars, by night, he used a larger aperture.

367. But the merit of all those improvements was in a manner cancelled by the discovery of the much more commodious reflecting telescope. For a refracting telescope, even of 1000 feet focus, supposing it possible to be made use of, could not be made to magnify with distinctness more than 1000 times; whereas a reflecting telescope, not exceeding nine or ten feet, will magnify 1200 times. 'It must be acknowledged,' says Dr. Smith in his *Complete System of Optics*, 'that Mr. James Gregory of Aberdeen was the first inventor of the reflecting telescope.' But, according to Dr. Pringle, Mersennus was the man who entertained the first thoughts of a reflector. A telescope with specula he certainly proposed to the celebrated Descartes many years before Gregory's invention, though indeed in a manner so very unsatisfactory that Descartes, who had given particular attention to the improvement of the telescope, was so far from approving the proposal, that he endeavoured to

convince Mersennus of its fallacy. See TELESCOPE. Dr. Smith had not seen two letters of Descartes to Mersennus on that subject.

368. Gregory, a young man of an uncommon genius, was led to the invention in seeking to correct two imperfections of the common telescope: the first was its too great length, which made it less manageable; the second, the incorrectness of the image. Mathematicians had demonstrated that a pencil of rays could not be collected in a single point of a spherical lens; and also that the image transmitted by such a lens would be in some degree incurvated. These inconveniences he believed would be obviated by substituting for the object-glass a metallic speculum, of a parabolic figure, to receive the image, and to reflect it towards a small speculum of the same metal; this again was to return the image to an eye-glass placed behind the great speculum, which for that purpose was to be perforated in its centre. This construction he published in 1663 in his *Optica Promota*. But as Gregory was endowed with no mechanical dexterity, nor could find any workman capable of realising his invention, after some fruitless attempts in that way, he was obliged to give up the pursuit; and probably, had not some new discoveries been made in light and colors, a reflecting telescope would never more have been thought of, considering the difficulty of the execution, and the small advantages that could accrue from it, deducible from the principles of optics then known.

369. But Newton, whose genius for experimental knowledge was equal to that for geometry, happily interposed, and saved this noble invention from well nigh perishing in its infant state. He likewise, at an early period of life, had applied himself to the improvement of the telescope; but, imagining that Gregory's specula were neither very necessary nor likely to be executed, he began with prosecuting the views of Descartes, who aimed at making a more perfect image of an object by grinding lenses, not to the figure of a sphere, but to that of a conic section. While he was thus employed, three years after Gregory's publication, he happened to examine the colors formed by a prism, and, having by that simple instrument discovered the different refrangibility of the rays of light, he perceived that the errors of telescopes, arising from that cause alone, were some hundred times greater than those occasioned by the spherical figure of lenses. This circumstance forced Newton to fall into Gregory's track, and to turn his thoughts to reflectors. 'The different refrangibility of the rays of light,' he says, in a letter to Mr. Oldenburg, secretary to the Royal Society, dated February, 1672, 'made me take reflectors into consideration; and finding them regular, so that the angle of reflection of all sorts of rays was equal to the angle of incidence, I understood that, by their mediation, optic instruments might be brought to any degree of perfection imaginable, providing a reflecting substance could be found which would polish as finely as glass, and reflect as much light as glass transmits, and the art of communicating to it a parabolic figure be also obtained. Amidst these thoughts I was forced from Cambridge by

the intervening plague, and it was more than two years before I proceeded further.' If Newton, then, was not the first inventor of the reflecting telescope, he was the main and effectual inventor. By his admirable genius he fell upon this new property of light; and thereby found that all lenses, of whatever figure, would be affected more or less with such prismatic aberrations of the rays as would be an insuperable obstacle to the perfection of a dioptric telescope.

370. About the end of 1668, or beginning of 1669, Newton, not relying on any artificer for making his specula, set about the work himself, and early in 1672 completed two small reflecting telescopes. In these he ground the great speculum into a spherical concave, but found himself unable to accomplish the parabolic form. In the letter that accompanied one of these instruments, which he presented to the Society, he writes, 'that though he then despaired of performing that work (to wit, the parabolic figure of the great speculum) by geometrical rules, yet he doubted not but that the thing might in some measure be accomplished by mechanical devices.'

371. Not less did the difficulty appear to find a metallic substance that would be of a proper hardness, have the fewest pores, and receive the smoothest polish: a difficulty which he deemed almost insurmountable, when he considered that every irregularity in a reflecting surface would make the rays of light stray five or six times more out of their due course than the like irregularities in a refracting one. In another letter written soon after he tells the secretary 'that he was very sensible that metal reflects less light than glass transmits; but as he had found some metallic substances to be more strongly reflective than others, to polish better, and to be freer from tarnishing than others, so he hoped that there might in time be found out some substances much freer from these inconveniences than any yet known.' Newton therefore labored till he found a composition that answered in some degree, and presented a reflecting telescope to the Royal Society; from whom he received such thanks as were due to so curious and valuable a present. And Huygens, one of the greatest geniuses of the age, and a distinguished improver of the refractor, no sooner was informed by Mr. Oldenburg of the discovery, than he wrote an answer 'that it was an admirable telescope; and that Mr. Newton had well considered the advantage which a concave speculum had above convex glasses in collecting the parallel rays, which, according to his own calculation, was very great; hence that Mr. Newton could give a far greater aperture to that speculum than to an object-glass of the same distance of focus, and consequently much more magnify in his way than by an ordinary telescope. Besides that by the reflector he avoided an inconvenience inseparable from object-glasses, which was the obliquity of both their surfaces, which vitiated the refraction of the rays that pass towards the sides of the glass, and did more hurt than men were aware of. Again, that by the mere reflection of the metalline speculum there were not so many rays lost as in glasses, which reflected a considerable quantity by each of their surfaces, and, besides, intercepted many of them by the

obscurity of their matter: that the main business would be to find a matter for this speculum that would bear as good a polish as glass.'

372. Mr. Huygens was not satisfied with thus expressing to the Society his high approbation of Newton's invention; but drew up a favorable account of the new telescope, which he caused to be published in the *Journal de Sçavans* for 1672, by which it was soon known over Europe. But how excellent soever the contrivance was, how well soever supported and announced to the public, yet whether it was that the artists were deterred by the difficulty and labor of the work, or that the discoveries even of a Newton were not to be exempted from the general fatality attending great and useful inventions, the making a slow and vexatious progress to the authors; the fact is that, excepting an unsuccessful attempt which the Society made, by employing an artificer to imitate the Newtonian construction, but upon a larger scale, and a disguised Gregorian telescope, set up by Cassegrain abroad as a rival to Newton's, and that in theory only (for it was never put in execution by the author) no reflector was heard of for nearly half a century after. But a reflecting telescope was at last produced to the world, of the Newtonian construction, by Dr. Hadley, which the author had the satisfaction to find executed in such a manner as left no room to fear that the invention would any longer continue in obscurity.

373. This memorable event was owing to the genius, dexterity, and application of Dr. Hadley, the inventor of the reflecting quadrant, another most valuable instrument. The two telescopes which Newton had made were but six inches long, were held in the hand for viewing objects, and in power were compared to a six feet refractor; whereas Hadley's was above five feet long, was provided with a well-contrived apparatus for managing it, and equalled in performance the famous aerial telescope of Huygens of 123 feet in length. Excepting as to the manner of making the specula we have, in the transactions of 1723, a complete description, with a figure of this telescope, together with that of the machine for moving it; but, by a strange omission, Newton's name is not once mentioned in that paper; so that any person not acquainted with the history of the invention, and reading that account only, might be apt to conclude that Hadley had been the sole inventor. The same celebrated artist, after finishing two telescopes of the Newtonian construction, accomplished a third in the Gregorian way; but, it would seem, less successfully, by Dr. Smith's declaring so strongly in favor of the other. Dr. Hadley instructed Mr. Molyneux and the Rev. Dr. Bradley; and when these gentlemen had made a sufficient proficiency in the art, being desirous that these telescopes should become more public, they liberally communicated to some of the principal instrument-makers of London the knowledge they had acquired from him. Such scholars soon advanced beyond their masters, and completed reflectors by other and better methods than what had been taught them.

374. Mr. James Short, as early as 1734, had signalled himself at Edinburgh by his instruments

of this kind. Mr. Maclaurin wrote that year to Dr. Jurin, 'that Mr. Short, who had begun with making glass specula, was then applying himself to improve the metallic; and that, by taking care of the figure, he was enabled to give them larger apertures than others had done; and that upon the whole they surpassed in perfection all that he had seen of other workmen.' He added, 'that Mr. Short's telescopes were all of the Gregorian construction; and that he had much improved that excellent invention.' This character of excellence Mr. Short maintained to the last; as he had been well grounded both in the geometrical and philosophical principles of optics, and upon the whole was a most intelligent person in whatever related to his profession. It was supposed he had fallen upon a method of giving the parabolic figure to his great speculum: a point of perfection which Hadley never attempted, either in his Newtonian or Gregorian telescope. Mr. Short indeed said he had acquired that faculty, but never would tell by what means he effected it; so that the secret of working that configuration died with that ingenious artist. Mr. Mudge, however, has lately realised the expectation of Sir Isaac Newton, who about 100 years ago presaged that the public would one day possess a parabolic speculum, not accomplished by mathematical rules, but by mechanical devices.

375. This desideratum was not the only want supplied by this gentleman: he taught us likewise a better composition of metals for the specula, how to grind them better, and how to give them a finer polish; and the polish, he remarks, was the most difficult and essential of the whole operation. 'In a word,' says Sir John Pringle, 'I am of opinion there is no optician in this great city (which has been so long and so justly renowned for ingenious and dextrous makers of every kind of mathematical instruments) so partial to his own abilities as not to acknowledge that, however some parts of the mechanical process now disclosed might have been known before any individuals of the profession, yet that Mr. Mudge has opened to them all some new and important lights, and upon the whole hath greatly improved the art of making reflecting telescopes.'

376. The late Rev. and ingenious John Edwards devoted much of his time to the improvement of reflecting telescopes, and brought them to such perfection that Dr. Maskelyne, the astronomer royal, found telescopes constructed by him to surpass in brightness, and other essentials, those of the same size made by the best artists in London. The chief excellence of his telescopes arises from the composition, which, from various trials on metals and semimetals, he discovered for the specula, and from the true parabolic figure, which, by long practice, he had found a method of giving them, preferable to any that was known before him. His directions for the composition of specula, and for casting, grinding, and polishing them, were published, by order of the commissioners of longitude, at the end of the Nautical Almanac for 1787; to which is also annexed his account of the cause and cure of the tremors which particularly affect reflecting telescopes more than refracting ones,

together with remarks on the said tremors by Dr. Maskelyne.

377. But, in constructing reflecting telescopes of extraordinary magnifying powers, Dr. Herschel displayed skill and ingenuity surpassing all his predecessors. He made them from seven, ten, twenty, to even forty feet in length. Of its construction, magnifying powers, and the curious collection of machinery by which it is supported and moved from one part of the heavens to another, accounts will be found under TELESCOPE.

378. The greatest improvement in refracting telescopes hitherto made public is that of Mr. Dollond. But besides the obligations we are under to him for correcting the aberration of the rays of light in the focus of object-glasses, arising from their different refrangibility, he made another considerable improvement, viz. by correcting both this kind of aberration, and also that which arises from the spherical form of lenses, by an expedient of a very different nature, viz. increasing the number of eye-glasses. If any person, says he, would have the visual angle of a telescope to contain 20° , the extreme pencils of the field must be bent or refracted in an angle of 10° ; which, if it be performed by one eye-glass, will cause an aberration from the figure, in proportion to the cube of that angle; but, if two glasses are so proportioned and situated as that the refraction may be equally divided between them, they will each of them produce a refraction equal to half the required angle; and therefore the aberration, being in proportion to the cube of half the angle taken twice over, will be but a fourth part of that which is in proportion to the cube of the whole angle; because twice the cube of one is but one-fourth of the cube of two; so the aberration from the figure, where two eye-glasses are rightly proportioned, is but a fourth of what it must unavoidably be where the whole is performed by a single eye-glass. By the same reasoning, when the refraction is divided between three glasses, the aberration will be found to be but the ninth part of what would be produced from a single glass; because three times the cube of one is but one-ninth of the cube of three. Whence it appears that, by increasing the number of the eye-glasses, the indistinctness which is observed near the borders of the field of a telescope may be very much diminished, though not entirely taken away.

379. The method of correcting the errors arising from the different refrangibility of light is of a different consideration. For, whereas the errors from the figure can only be diminished in a certain proportion according to the number of glasses, in this they may be entirely corrected by the addition of only one glass; as we find in the astronomical telescope that two eye-glasses, rightly proportioned, will cause the edges of objects to appear free from colors, quite to the border of the field. Also in the day telescope, where no more than two eye-glasses are absolutely necessary for erecting the object, we find that, by the addition of a third rightly situated, the colors, which would otherwise make the image confused, are entirely removed. This, however, is to be understood with some limita-

tion; for, if the glasses exceed a certain length, the colors may be spread too wide to be admitted through the pupil of the eye; which is the cause that in long telescopes, with three eye-glasses, the field is always greatly contracted.

380. These considerations first set Mr. Dollond on contriving how to enlarge the field by increasing the number of eye-glasses without any hindrance to the distinctness or brightness of the image; and though others had been about the same work before, yet, observing that some five-glass telescopes then made would admit of farther improvement, he endeavoured to construct one with the same number of glasses in a better manner; which was allowed by the best judges to be a considerable improvement on the former. Thus encouraged he resolved to try if he could make some farther enlargement on the field by the addition of another glass, and by placing and proportioning the glasses in such a manner as to correct the aberrations, without detriment to the distinctness. At last he obtained as large a field as is necessary, even in the longest telescopes that can be made. These telescopes with six glasses having been well received, and some of them purchased abroad, the author fixed the date of his invention, in a letter, addressed to Mr. Short, which was read to the Royal Society, March 1st, 1753.

381. Various attempts were made about this time to shorten and otherwise improve telescopes. Among these we must mention that of Mr. Caleb Smith, who thought he had found it possible to rectify the errors which arise from the different degrees of refrangibility, on the principle that the sines of refraction, or rays differently refrangible, are to one another in a given proportion, when their sines of incidence are equal; and he proposed for this purpose to make the speculums of glass instead of metal, the two surfaces having different degrees of concavity. But his scheme was never executed; nor is it probable, for reasons which have been mentioned, that any advantage could be made of it.

382. To Mr. Short we are indebted for the excellent contrivance of an equatorial telescope, or portable observatory; whereby pretty accurate observations may be made with little trouble by those who have no building adapted to the purpose. This instrument consists of an ingenious piece of machinery, by the help of which a telescope mounted upon it may be directed to any degree of right ascension or declination, so that the place of any of the heavenly bodies being known, they may be found without any trouble, even in the day-time. Being made to turn parallel to the equator, any object is easily kept in view, or recovered, without moving the eye from its situation. By this instrument, Mr. Short informs us, that most of the stars of the first and second magnitude have been seen even at mid-day, and the sun shining bright; as also Mercury, Venus, and Jupiter. Saturn and Mars are not so easy to be seen, on account of the faintness of their light, except when the sun is but a few hours above the horizon. This particular effect depends upon the telescope excluding almost all the light, except what comes from the object itself, and which might otherwise efface the impression made by its weaker light upon the eye.

For the same reason stars are visible in the day-time from the bottom of a deep pit. Mr. Ramsden has also invented a portable observatory or equatorial telescope. This, however, as well as the improved telescopes by Herschel and Ramsden, will be fully described under the article exclusively devoted to the subject.

383. The most important part of every compound optical instrument is the *lens*; it may therefore be advisable to illustrate their general form by a series of diagrams, and then furnish the mathematical data for their construction.

384. A lens is any transparent substance, as glass, crystal, water, or diamond, having one or both of its surfaces curved to collect or disperse the light transmitted by it. The lenses in general use are made of glass, and are usually called magnifying glasses. Glass, however, does not possess a greater share of the magnifying property than other transparent substances. In fig. 5 there are six differently shaped lenses, shown in section. A is called a plano-convex, from having one side flat, and the other spherically rounded. B is a double convex, and has both sides spherically rounded. When these sides are unequally curved, as at C, it is termed a crossed lens. D is a plano-concave, having one side spherically hollow. E is a double concave with both sides hollow. F is a meniscus (so called from its moon shape), and has one side convex and the other concave.

385. The passage of light when transmitted by a plano-convex lens, is shown in the accompanying diagram. The parallel rays *a, b, c, &c.*, fall-

ing upon the plano-convex lens A D B, and passing through it, are but half as much refracted as they would be in passing through the double convex lines A D B E, and therefore their focus or point of meeting is not at C but at F, which is at twice the distance, or double the radius of the convexity of the lens. After intersecting at F they diverge.

386. When an object is placed in the focus of a lens, the rays diverging from it will, by the action of the lens, be rendered parallel. Thus, in the annexed diagram, the radiant point A,

from which the rays d, e, f , &c., diverge, is in the centre of convexity of the double convex lens a, b, c . After passing through the lens, the rays go on parallel to each other in the space $C D$. If the lens had been plano-convex, the radiant point for this purpose must have been at B , or at twice the distance of A from B .

387. Rays diverging from a radiant point beyond the focal distance of a convex lens, will, after passing through the lens, converge to a point or focus on the other side of the lens. Thus in the following diagram F is the focus of the lens

B , and A is the radiant point from which the rays a, b, c , &c., diverge. After passing through the lens they will converge and meet in a focal point, as at C . The farther A is from B the nearer will C be to it.

388. Rays diverging from a radiant point between a convex lens and its focus will continue to diverge, though in a less degree, after passing through the lens, as in the accompanying figure,

in which A is the radiating point from which the rays a, b, c , &c., diverge, and F is the focus of the lens B . These rays, after passing through the lens, continue to diverge in the space $C D$.

389. The focus of the sun's parallel rays, when transmitted through a double convex lens, is shown in the annexed figure. The parallel rays

a, b, c, d, e, f , falling obliquely on the surface $A D$ of a double convex lens, are refracted or bent inward in passing through the lens; and

meet in a focus or point at C , which is the centre of the lens's convexity, beyond which they diverge to the contrary sides as a, b, c, d , &c. The middle ray d , falling perpendicularly on the surface of the lens at D , suffers no refraction in passing through it.

390. A convex glass magnifies the angle of vision; the reason is this. Without a lens, $F G$,

the eye would see the arrow BC under the angle bAc . But the rays BF and CG , from the extremities of the arrow, in passing through the lens are refracted to the eye in the directions fA, gA , which makes the arrow to be seen under the much larger angle dAe , the same as the angle fAg . Therefore the arrow will appear so much magnified as to extend in length from D to E .

391. Parallel rays become parallel again by passing through two convex lenses placed parallel to each other and at double their focal distance. Thus, in the accompanying diagram, C is the fo-

cus of both the lenses A and B . The parallel rays a, b, c, d, e, f , having passed through the lens A , go on converging to its focus C , where they unite and thence diverge in a contrary order to the lens B , and after passing through it they go on parallel to each other, but in an inverted order as a, b, c, d, e, f, g . The middle ray d goes on straight, because it falls perpendicularly on the surface of both the lenses.

392. Concave lenses obey the same laws of refraction as convex, but, as the curvature is reversed, the rays are bent outwards; hence a concave lens will render parallel rays diverging, as may be seen in the following diagram. The rays a, b, c , &c., after passing through a plano-concave lens A , will go on in a diverging state, the same as if the lens were taken away, and the rays had issued from a radiant point F in the virtual focus of the lens, which is at double the distance CA or radius of concavity of the lens.

393. Parallel rays passing through a double concave lens may also be made to diverge. Thus

the rays *a, b, c, &c.*, after passing through the double concave lens *A*, will go on in a diverging state, the same as if the lens were taken away and the rays had proceeded from a radiant point *F* in the virtual focus or centre of concavity of the lens.

394. The manner in which the foci of lenses of different curves are calculated, and how the foci of combined lenses may be obtained, are as follows:—When the lenses are made of plate-glass, the focal distance is nearly the diameter of the sphere from which we may suppose a plano-convex lens to be cut, or it is equal to twice the radius of the circle that forms the convex surface of the lens. For example, if the globe of glass is one inch in diameter, and a portion is cut off to form a plano-convex lens, the focus will be one inch, or twice the radius of the circle. If the lens is double convex, the focus will be equal to the radius, or half the diameter. When the lens is crossed, or unequally convex, the focal length will be twice the product of the two radii, divided by the sum of the radii. For example, let the radius on one side be two inches, and on the other side six inches; the focus of this will be $2 \times 2 \times 6 = 24$, divided by $2 + 6 = 8$ or three inches. The focus of the miniscus lens is found by dividing twice the product of the two radii by their difference. Example; let the radius on the convex side be two inches, and on the concave side four, the focus is $2 \times 2 \times 4 = 16$ divided by $4 - 2 = 2$, or eight inches, the focus of the lens.*

* In many cases it is found advisable to ascertain the radii of the two surfaces of a convex lens, as well as its focus, by a more accurate method. This may be effected by forming a reflected image by the posterior surface, which distance will be half of the radius of curvature (or one quarter the focus of a plano-convex lens); then, by exposing the other side, we obtain the radii of the opposite surface. This method was adopted by professor Robison to mea-

395. If two lenses are placed in contact, the compound focus, when each lens has the same power, will be half the focus of the single lens. When two convex lenses are in contact, having different focal lengths, then, as the sum of the two foci is to one of them, so is the other to the compound focus required. For example, let the foci of the lenses be 2 and 6; then, as $2 + 6 = 8 : 2 :: 6 : 1\frac{1}{2}$, the compound focus. Lastly, if two lenses are not in contact, the compound focus is found by dividing the product of the two lenses by the sum lessened by their distance. Example: let the foci of the lenses be 2 and 4, their distance 2; then $2 \times 4 = 8$ divided by $(2 + 4) - 2 = 4$ gives 2 as the compound focus.

396. If lenses be made of different substances, although the curves may be the same, the focal lengths will vary; while, in like mediums, the action will always be equal. Let *a, b*, fig. 6, be a ray of light, and let it enter the medium *c d* at the point *b*; instead of continuing in a right line to *e* it will pass on in the direction *b f*, should the medium *c d* be denser than the first *a b*; now if on the point *b* a circle be drawn, and a line *s i* parallel to the surface of the medium, touching the incident ray *a b*, be produced to *e*, this line will be the sine of incidence; and, if another line *p r* be drawn in the same manner to the refracted ray, it will be the sine of refraction. Now if the angle *a b c* be varied to any degree, the sine *s i* will always be in the same proportion to the sine of refraction *p r*. If the dense medium is water, the sine *p r* will be three-fourths of *s i*. When glass is used the sines are as 2 to 3 nearly, and in diamond as 2 to 5.

397. When a ray is passing out of a dense medium into a rarer, the direction will be changed, and the ray *b f* will now be bent further from the perpendicular, so as to make the sines the reverse of the former case. Out of water they will be as 4 to 3; from glass as 3 to 2, and from diamond as 5 to 2. The theorems just described for finding the foci of lenses are called geometrical, and will be nearly the same as the refracted, when the lens is made of plate-glass. The refracted focus is only $\frac{1}{4}$ st part less than the geometrical, when ascertained by accurate experiment. The refracted focus of lenses of other media may be obtained by dividing the geometrical focus by the quotient obtained when the sine of incidence (*i*), minus the sine of refraction (*r*), is divided by half the sine of refraction. $\left(\frac{i - r}{\frac{1}{2} r}\right)$

398. Convex lenses, in their simple state, have been applied to collect the heat of the sun's rays for purposes similar to that of burning mirrors. One of the largest lenses that have been mounted for these purposes was that made of flint glass by Mr. Parker. This lens was three feet in diameter, and, when mounted, exposed a surface of 330 square inches to the sun's light; its focal distance was three feet nine inches, and the diameter of the circular spot of light was one inch. But, in order that the light might be condensed as much as possible, he employed another lens

sure the different radii of double and triple achromatic object-glasses.

thirteen inches diameter, and of twenty-nine inches focus, so as to decrease the diameter of the focal point to three-eighths of an inch. The apparatus on which it was mounted is shown in fig. 7: *a* is the large convex lens mounted in a ring, and connected to the smaller lens *b* by wooden ribs *c, c*; the lower rib has a piece *e* attached to it, capable of adjustment to or from the smaller lens: to this bar is fixed the holder *d*, having a universal joint. On this holder the substance to be experimented on is placed. The following are some of its effects on bodies placed in its focus; twenty grains of pure gold were fused in four seconds; ten grains of platina fused in three seconds; and a diamond, weighing ten grains, exposed for thirty minutes, lost four grains. This lens, which is now in the possession of the emperor of China, cost £700.

399. In large burning lenses the weight of the glass employed becomes of considerable importance; and, to effect as great a saving as possible, count Buffon has proposed to construct them of circular rings, as shown in fig. 8, where the lens is composed of three pieces, two rings, *a* and *b*, and a lens *c*. When, however, the size is very great, the rings may be composed of several pieces, as shown by the front view *E*, where the lens is built of ten pieces. These instruments have been denominated by Dr. Brewster, who suggested this division, polyzonal lenses.

400. The following advantages of these lenses have been laid down by Dr. Brewster:—

1. The difficulty of procuring a mass of flint-glass proper for a solid lens of great dimensions is in this construction completely removed.

2. If impurities exist in the glass of any of the spherical segments, or if an accident happen to any of them, it can be easily replaced at a very trifling expense. Hence the spherical segments may be made of glass much more pure and free from flaws and veins than the corresponding portions of a solid lens.

3. From the spherical aberration of a convex lens, the focus of the outer portion is nearer the lens than the focus of the central parts, and therefore the solar light is not concentrated in the same point of the axis. This evil may, in a great measure, be removed in the present construction, by placing the different zones in such a manner that their foci may coincide.

4. A lens of this construction may be formed by degrees, according to the convenience and means of the artist. One zone, or even one segment, may be added after another, and at every step the instrument may be used as if it were complete, without the rest of the zone to which it belongs; and it will contribute, in the proportion of its area, to increase the general effect.

5. If it should be thought advisable to grind the segments separately, or two by two, a much smaller tool will be necessary than if they formed one continuous lens. But, if it should be reckoned more accurate to grind each zone by itself, then the various segments may be easily held together by a firm cement.

6. Each zone may have a different focal length, and may, therefore, be placed at different distances from the focal point, if it is thought proper.

401. When two lenses are mounted in a frame to fix before the eyes, they are denominated spectacles: the lenses are employed to render the objects before the wearer more distinct. The eye, which consists of a convex lens, called the crystalline lens, refracts the light proceeding from the object placed before it in the same manner as a convex glass: the image of the object is formed at the focus of the lens, where it is received on a screen at the back of the eye; this screen, called the retina, is an expansion of the optic nerve, which conveys the sensation of vision to the mind. As the crystalline lens of the eye will only produce distinct vision when the focus is thrown on the retina, it is obvious that, should any defect occur with respect to that organ, indistinct and imperfect vision will arise. Thus, if the lens of the eye is not of a proper convexity to bring the image on the screen, an indistinctness must ensue. This is the case when the lens through age has become flattened; the image will then be thrown beyond the retina, and thus convey an imperfect representation of the object to the mind. To obviate this defect, we must make the rays pass through a glass of sufficient convexity to assist the eye, and enable it to form the image at the required place, which is in this instance done by shortening the focal distance of the crystalline lens of the eye. If, on the contrary, the eye should be too convex, or shortsighted, as is often the case with young persons, then the image will not be formed at a sufficient distance from the lens of the eye to reach the retina, and thus imperfect vision of distant objects is produced. To remedy this defect concave lenses must be resorted to, in order to diverge the rays before they enter the eye, and thus lengthen the focus of the crystalline lens to form an image on the retina. When the eyes are not directed near the centre of the spectacle-glasses, the obliquity of their surface to the rays will be increased, so as to occasion a confused appearance of the object. A great portion of this confusion is removed in the spectacles now usually made, when compared with those formerly employed, whose size, being very large, augmented the imperfection; for it may be observed that, when objects are seen through spectacle-glasses, no more of the glass is employed at one view than a portion equal to the size of the pupil of the eye: this on an average may be reckoned at the eighth of an inch in diameter. Thus we see how small a portion is used for the purposes of vision; but as it would be tedious to require the eye always to look through a small aperture, the glasses are left of a sufficient size to admit of a moderate degree of motion; and, as we require a greater latitude horizontally than vertically, their figure is made of an oval form.

402. In the selection of spectacle glasses great care should be used in examining them, and the first point of importance is the goodness of the material of which they are formed; this should be free from all veins or small bubbles, for if one of these occur in the portion through which we look it will greatly impair the eyes. The next circumstance is the color of the glasses; the best adapted for general purposes is a pale blue. The figure of their surfaces should be perfectly spher-

rical; for if they are curved more in one direction than in another they will injure the sight, unless they are cylindrically formed, as for some particular disease. The polish should be clean, and free from flare, which too often arises from the manner in which they are usually polished on heterogeneous surfaces, producing what is technically termed a curdled glass.

403. Dr. Wollaston, in order to allow the eyes a considerable latitude without fatigue, invented a peculiar form of glasses, called by him periscopic, from two Greek words signifying seeing about; their form is that of a meniscus with the concave side always turned towards the eye. When they are intended for long-sighted persons, or old age, the anterior surface, or that next the object, is formed spherically convex, with a curve deeper than the concave, so as both to gain the required power, and compensate for the divergency occasioned by the concave side; this form is shown at A, fig. 9. The periscopic form employed for correcting the defect of a short or near sight is shown in section at B, having its anterior surface convex, as in the former case; but here the concavity on its posterior side is increased to procure the required divergency, and compensate for the convex side.

404. The calculation of an achromatic object-glass, and in general that of every achromatic telescope, requires a precise knowledge of the ratio of the sines of incidence and refraction, and of the ratio of dispersion of the different kinds of glass which are used in the composition of telescopes. The methods hitherto employed for measuring these ratios have given results differing considerably from each other, in spite of the care and accuracy employed in the computation. We ought, therefore, to expect inaccuracies, which render the perfection of the object-glass doubtful. Experiments, repeated during many years, have led M. Fraunhofer, of Munich, to discover new methods of obtaining these ratios. The following is the order in which he made those experiments:—

405. He began by determining the dispersion of the single kind of glass, from the size of the prismatic spectrum, formed by a prism of a given angle in a dark chamber, and at a given distance, and from this he deduced the dispersion. The ends of the spectrum, however, were ill terminated, and a considerable uncertainty was attached to the results.

406. In order to determine the ratio of the refraction and dispersion of flint and crown glass, M. Fraunhofer made use of prisms of these two kinds of glass, having their respective angles small, and placed in opposite directions. These last were then successively changed, till, on the one hand, the refrangibility, and on the other the refraction, was nothing. The ratio of the angles was then the inverse ratio of that of the refrangibility or the refraction. Several prisms, however, thus put together in pairs, gave different results, particularly for the dispersion. Hence, in order to determine the relative dispersion, he selects larger prisms, having their refracting angles also greater, and placed in opposite directions. The prism of crown-glass had an angle of from 60° to 70° . The angle of one of the prisms was changed till the dis-

persion was almost destroyed; and the little that remained was then corrected, by changing the angle of incidence of the ray. Since, in prisms with great angles, the light is totally reflected at the second surface, even by a small variation of the angle of incidence, he covered the two touching faces of the prisms with a strong refracting fluid, such as oil, and by this means the light was transmitted at almost all angles of incidence. He applied the two prisms before the object-glass of the telescope, and a repeating theodolite, having placed them upon a horizontal plane, with a steel axis, round which it moved. The box in which the axis turned was firmly united with the telescope, as shown in fig. 10. By this procedure he was enabled to measure exactly the angle of incidence at which the dispersion was destroyed. He first looked through the telescope across the prism, at a distant object, having its edges vertical and very distinct; he then changed the angle of incidence, by turning the plane upon which the prism rested, and the alidade of the theodolite, till the dispersion appeared to be very small, or rather till the vertical edges of the object were most distinct. In order to measure the angle of incidence, he had put upon the turning-plane a ruler, which carried two steel points that exactly touched the first surface of the prisms. On this ruler was fixed a telescope, a little elevated, whose axis was perfectly parallel to the two points of steel. See fig. 11. This telescope was fixed upon the ruler only by its two ends, so that, through the interstice between the telescope and the ruler, the light could freely fall upon the prisms. Hence it was easy to measure in this manner by the theodolite the angle of incidence. Knowing, therefore, this angle, and also the index of refraction, and the angles of the prisms, which can be obtained exactly by the same ruler of the theodolite, the ratio of dispersion could then be deduced by a very exact expression.

407. The observation made with two similar prisms agreed so well that, in an object-glass calculated after these data, there was no injurious aberration of color. But if, in determining the relative dispersion, we employ different pairs of prisms, formed of the same kind of glass, and having their angles different, the results present differences which might leave an uncorrected aberration injurious to object-glasses of considerable dimensions. This result conducted him to the following experiments:—

408. If we look at an object across two prisms of flint and crown-glass, with their refracting angles in opposite directions, particularly with a telescope, it will never appear without color. At a certain angle of the incident rays the dispersion is a minimum, and, either by increasing or diminishing this angle, the dispersion increases. The remaining dispersion arises, as is well known, from the different prismatic colors having a different ratio of dispersion in the two kinds of glass. If, in crown-glass, for example, the dispersion of the red rays is to that of the same rays in flint-glass as ten to nineteen, then the violet rays may be dispersed in the ratio of ten to twenty-one. Hence, the two dispersions can never entirely compensate one another.

409. It would be of great importance to determine for every species of glass the dispersion of each separately-colored ray. But, since the different colors of the prism do not present any precise limits, the spectrum cannot be used for this purpose. More precision would be obtained if we possessed glasses or colored fluids which permitted only light of the same color to pass; the one, for example, permitting only the blue light to pass, and the other only the red. M. Fraunhofer was not, however, fortunate enough to procure either a glass or a fluid which possessed this property. In every case the white light which passed through was still decomposed into all its colors, with this difference only, that in the spectrum the color peculiar to the glass or the fluid was more brilliant than the rest. Even the colored flames obtained by burning alcohol, sulphur, &c., seen through a prism, do not yield a homogeneous light corresponding to the color. These flames, however, such as that of a lamp, particularly that of a candle, and, in general, the light produced by the flame of a fire, exhibit between the red and yellow of the spectrum a clear and well marked line, which occupies the same place in all the spectra. This line appears to be formed by rays which are not decomposed by the prism, and which consequently are homogeneous. In the green space we perceive a similar line, but it is weaker and less distinct, so that it is often very difficult to find.

410. It was, however, absolutely necessary for M. Fraunhofer to have homogeneous light of each color, and the following was the method which he employed:—Behind an aperture in a shutter, 1·5 of an inch wide and 0·07 wide, he placed a prism A, fig. 12, of flint-glass, with an angle of about 40°; and at B C, a distance of about thirteen feet, he placed six lamps, whose light fell through narrow apertures on the prism A. The width of these apertures was 0·05 of an inch, their height nearly 1·5, and the distance of one lamp from another 0·58. The light of the lamps which fell on the prism A was refracted by it, and decomposed into colors, and afterwards passed through the aperture in the shutter. From the lamp C, for example, the red rays came in the direction of E, and the violet in that of D. From the lamp B the red rays passed towards F, and the violet rays towards G, &c. At the window of another house, 692 feet from A, and at the same height of the plane B A C, he placed the theodolite already mentioned, before the telescope of which, on the horizontal plane, was set the prism H, whose index of refraction for the different colored rays he wished to determine. The prism H could only receive from the lamp C the red rays, the others, for example the violet, going to a side at D, did not fall upon the prism. In like manner, from the lamp B, it was only the violet rays which fell upon the prism H. In this way the prism relieved from each lamp rays of a different color, setting out from the same point. If the prism H, or the aperture of the object-glass, was not too broad, some rays of the six lamps, for example those between the violet and the blue, between the blue and the green, &c., will not fall upon the prism H, but will be entirely wanting. In this case the spec-

trum of rays passing by the small aperture A, and seen by the prism H, and by the telescope of the theodolite, will appear as in fig. 13, where I is the violet, K the blue, L the green, &c., and each color will appear separate. The distances ON, NM, &c., will increase as the dispersive power of the glass with the same angle of the prism H is greater. Since these distances, and the angle formed by the incident ray with an emergent ray, may be measured by the theodolite with a great degree of accuracy, it is easy, by means of this mechanism, to determine the index of refraction of each colored ray for every kind of refracting substance. Above the prism A, at the distance of one foot and a half, he made another aperture in the shutter, in the same vertical line with A, behind which he placed a lamp, from which the prism H likewise received light. The spectrum produced by the lamp ought then to appear by the prism before the telescope of the theodolite, and below the colored points as P, R, Q. The shining orange or reddish line which appears in every spectrum of the light of the fire is shown at R. This line enables us, in the present case, to be certain that, on different days of observation, we have always the same color in the colored points, which would not take place if the table on which the lamps are placed suffer the least change in relation to the prism. On this account we ought to place the table so that the point N may always be found in the same vertical line with R. When this is not the case it is easy to bring it to the position by the adjusting-screws B and C. Since the distance of the lamps, or rather that of the small apertures by which the light falls on the prism A is invariable, we are sure, on different days of observation, to have always the same color in the colored points.

411. The distances of some of these colored points, for example the violets, the blues, and the reds, whose light is weak, cannot be measured without illuminating the micrometer wires of the telescope. These colored points, however, lose, by the ordinary method of illuminating the field, as much light as the wires receive, and therefore this method cannot be employed. It was necessary, therefore, to have a mechanism by which the wires alone could be illuminated, while the rest of the field remained dark. Such a mechanism M. Fraunhofer applied to his micrometer. The illuminating of the wires may thus be modified at pleasure, and always with facility. This is effected on the side of the eye-glass by means of a small lamp enclosed in a hollow globe, from which the light falls upon a lens, and throws it in a parallel manner on the wires. At the inner margin of the eye-glass, constructed for the purpose, the rest of the incident light is absorbed without falling on the lens. With this apparatus he has measured the angles of refraction of the different colored rays for several refracting substances, the results of which are given in the following table. With all the substances the angle of the incident ray is equal to the angle of the emergent ray N. Each angle was measured four times. Since the light which sets out from A does not fall in a parallel manner on the prism H; or rather, since the plane in which the prism H is placed is not in the axis of the theodolite,

but at its centre is distant from the axis 4.25 inches, it was necessary to apply a small correction to the angle that the incident ray makes with the emergent ray N. The distance of A from H

being 692 feet, the correction for the prism of flint-glass is + 31', for that of crown-glass + 40', and for water 40', &c. The angles LM, NM, &c., do not require this correction.

| Refracting Media. | Temp. Reau- mur. | Specific Gravity. | Angle of the Prism. | Angle of De- viation, or of N. | See Fig. 12. | | | | |

412. In the following table we have given the indices of refraction for the different colored rays in flint glass, crown glass, and water, which

have been computed from the observed angles, calling O_n the index of refraction for the ray O, and N_n that for the ray N, &c.

| Refracting Media. | O_n | N_n | M_n | L_n | K_n | I_n |
|----------------------|---------|---------|---------|---------|---------|---------|
| Flint glass, No. 13. | 1.63074 | 1.63505 | 1.63933 | 1.64349 | 1.64775 | 1.65203 |
| Crown glass, No. 9. | 1.52736 | 1.52959 | 1.53173 | 1.53380 | 1.53586 | 1.53783 |
| Water | 1.33209 | 1.33359 | 1.33501 | 1.33635 | 1.33763 | 1.33888 |

413. From these data there results the ratio of the dispersion of the different colored rays for these refracting media, as is shown in the follow-

ing table, where O_n' , N_n' , &c., are the indices of refraction from the substances that have the strongest dispersion.

| Refracting Media. | $N_n' - O_n'$ | $M_n' - N_n'$ | $L_n' - M_n'$ | $K_n' - L_n'$ | $I_n' - K_n'$ |
|-------------------------|---------------|---------------|---------------|---------------|---------------|

414. From these results it is obvious that there are great anomalies in the ratio of the dispersion of the differently-colored rays in some refracting media.

415. These experiments led him to make some observations on the influence of heat upon the refraction of fluids. By the least change of temperature, the refraction of all fluids becomes stronger in the lower part of the prismatic spectrum than it is in the upper part: and hence every fluid acquires a kind of undulation, which prevents the colored points of the spectrum from being precisely distinguished. In making these experiments during the night, when the temperature continually changes, M. Fraunhofer was

obliged to stir the fluid every five or ten minutes, in order to render it homogeneous. These differences are not great in water, but in other fluids they are so considerable that all the spectrum is dispersed and confounded, even if the vessel is shut up from the air. Hence it follows that we ought not to expect good object-glasses by substituting fluids in place of flint-glass. We see also, from these experiments, how difficult it must be to melt flint and crown glass of a perfect homogeneity, since in every furnace of a glass-house the heat of the upper part of the crucible is almost one-third stronger than that of the lower part.

416. In order to obtain the indices of refrac-

tion of the differently-colored rays with more exactness, and in order to determine if the action which refracting substances exert upon the light of the sun is the same as upon artificial light, he adopted the following method :—

417. Into a dark room and through a narrow vertical aperture in the window-shutter, about 15" broad, and 36" high, he introduced the rays of the sun upon a prism of flint-glass placed upon the theodolite. This instrument was twenty-four feet from the window, and the angle of the prism was nearly 60°. The prism was placed before the object-glass of the telescope, so that the angles of incidence and emergence were equal. In looking at this spectrum for the bright line, which he had discovered in a spectrum of artificial light, he discovered, instead of this line, an infinite number of vertical lines of different thicknesses. These lines are darker than the rest of the spectrum, and some of them appear entirely black. When the prism was turned, so that the angle of incidence increased, these lines disappeared; and the same thing happened when the angle was diminished. If the telescope was considerably shortened, these lines re-appeared at a greater angle of incidence; and, at a smaller angle of incidence, the eye-glass required to be pulled much farther out, in order to perceive the lines. If the eye-glass had the position proper for seeing distinctly the lines in the red space, it was necessary to push it in to see the lines in the violet space. If the aperture by which the rays entered was enlarged, the finest lines were not easily seen, and they disappeared entirely when the aperture was about 40". If it exceeded a minute the largest lines could scarcely be seen. The distances of these lines and their relative proportions suffered no change, either by changing the aperture in the shutter, or varying the distance of the theodolite. The refracting medium of which the prism is made, and the size of its angle, did not prevent the lines from being always seen. They only became stronger or weaker, and were consequently more or less easily distinguished in proportion to the size of the spectrum. The proportion even of these lines to one another appeared to be the same for all refracting substances; so that one line is found only in the blue, another only in the red, and hence it is easy to recognise those which we are observing. The spectrum, formed by the ordinary and extraordinary pencils of calcareous spar, exhibit the same lines. The strongest lines do not bound the different colors of the spectrum; for the same color is almost always found on both sides of a line, and the transition from one color to another is scarcely sensible.

418. Fig. 14, shows the spectrum with the lines such as they are actually observed. It is, however, impossible to express on this scale all the lines and the modifications of their size. At the point A the red nearly terminates, and the violet at I. On either side we cannot define with certainty the limits of these colors, which, however, appear more distinctly in the red than in the violet. If the light of an illuminated cloud falls through the aperture on the prism,

the spectrum appears to be bounded on one side between G and H, and on the other at B. The light of the sun, too, of great intensity, and reflected by a heliostat, lengthens the spectrum almost one-half. In order, however, to observe this great elongation, the light between C and G must not reach the eye, because the impression of that which comes from the extremities of the spectrum is so weak as to be extinguished by that of the middle of the spectrum. At A, we observe distinctly a well-defined line. This, however, is not the boundary of the red, which still extends beyond it. At *a* there is a mass of lines, forming together a band darker than the adjacent parts. The line at B is very distinct, and of a considerable thickness. From C to D may be reckoned nine very delicate and well-defined lines. The line at C is broad, and black like D. Between C and D are found nearly thirty very fine lines, which, however, with the exception of two, cannot be perceived but with a high magnifying power, and with prisms of great dispersion; they are besides well-defined. The same is the case with the lines between B and C. The line D consists of two strong lines, separated by a bright one. Between D and E we recognise about eighty-four lines of different sizes. That at E consists of several lines, of which the middle one is the strongest. From E to *b* there are nearly twenty-four lines. At *b* there are three very strong ones, two of which are separated by a fine and clear line. They are among the strongest in the spectrum. The space *b* F contains nearly fifty-two lines, of which F is very strong. Between F and G there are about 185 lines of different sizes. At G many lines are accumulated, several of which are remarkable for their size. From G to H there are nearly 190 different lines. The two bands at H are of a very singular nature. They are both nearly equal, and are formed of several lines, in the middle of which there is one very strong and deep. From H to I they likewise occur in great numbers. Hence it follows that in the space B H there are 574 lines, the strongest of which are shown in the figure. The relative distances of the strongest lines were measured with the theodolite, and placed in the figure from observation. The faintest lines only were inserted from estimation by the eye.

419. Various experiments and changes, to which M. Fraunhofer has submitted these lines, convinces him that they have their origin in the nature of the light of the sun, and that they cannot be attributed to illusion, to aberration, or any other secondary cause. In transmitting the light of a lamp through the same aperture, we observe only the light shown at R, in fig. 13. It occupies, however, exactly the same place as D in fig. 14; so that the index of refraction of the line D is the same as that of R.

420. It is easy to understand why the lines are not well marked, and why they disappear, if the aperture of the window becomes too large. The largest lines occupy nearly a space of from 5" to 10". If the aperture is not such that the light which passes through it cannot be regarded as a single ray, or if the angle of the width of the

aperture is greater than that of the width of the line, then the image of the same line will be projected several times parallel to itself, and will consequently become indistinct, and disappear when the aperture is too great. The reason why, in turning the prisms, we cease to see the lines, unless the telescope is lengthened or shortened, may be thus explained:—

421. The emersion of the rays, in respect to their divergence, is similar to their immersion only in the case where the angles of incidence and emergence are equal. If the first angle is greater, the rays after refraction will diverge, as it were, from a more distant point, and, if it is smaller, from a nearer point. The reason of this is, that the path of the rays which pass nearer the vertex of the prism is shorter than that of those which pass at a greater distance from the vertex. Hence the angles of the refracted rays are not changed, but the sides of the triangles for the emergent rays ought to be in the one case greater, and in the other smaller. This difference ought to vanish if the rays fall in parallel directions on the prism, which is also proved by experiment. As the violet rays have, by the object-glass of the telescope, though a chromatic, a focal distance a little shorter than the red rays, we see clearly why it is necessary to displace the eye-glass, in order to perceive the lines distinctly in the different colors.

422. As the lines of the spectrum are extremely narrow, the apparatus must be very perfect, in order to avoid all aberration, by which the lines may be rendered indistinct, and even dispersed. The sides of the prism ought consequently to be perfectly plain, and the glass of which the prisms are made ought to have neither scratches nor striæ. With English flint-glass which is never entirely free of these striæ, we can only see the strongest lines. Common glass, and even the English crown-glass,

contains many striæ, though they are not always visible to the eye. Those who cannot procure a perfect prism of flint-glass should use a fluid of great dispersive power, such as oil of aniseed, in order to see all the lines. In this case, the prismatic vessel ought to have its sides perfectly plane and parallel. In general, the sides of all the prisms should form an angle of 90° with their base, and this base ought to be placed horizontally before the telescope, if the axis of the telescope is horizontal. The narrow aperture by which the light passes ought to be exactly vertical. The reason why the lines become indistinct, if any of the conditions now mentioned is neglected, may now be readily understood.

423. As the lines of the spectrum are seen with every refracting substance of uniform density, M. Fraunhofer has employed this circumstance for determining the index of refraction of any substance for each colored ray. This could be done with the greater exactness, as most of the lines are very distinct and well marked. For this purpose he selected the largest lines, because with substances of low refractive power, or with prisms of small refracting angles, the lines of less magnitude could scarcely be perceived with a strong magnifying power. The lines which he preferred were those marked B, C, D, E, F, G, H, in fig. 14. He made no use of the line *b* because it is too near F, and he endeavoured to use the middle one between D and F. It is not practicable to measure larger arcs, such as B H, but only small ones like B C, C D, because, in order to see the lines of the different colors distinctly, the eye-glass requires to be displaced.

424. The following table contains the measures of the angles obtained from different kinds of glass, and other refracting substances:—

| refracting media. | Temperature. Reaumur. | Sp. Gr. | Angle of the prism. | Angle of deviation. | B C | C D | D E | E F | F G | G H |

427. The preceding table shows the difference of dispersion relative to differently-colored rays for each combination of refracting substances. For example, for flint-glass, No. 13, and water, the ratio of dispersion of the rays in the space BC is as 1 to 2·56; and of the space GH as 1 to 3·73. As these differences, however, are very small in some substances, as in flint-glass and oil of turpentine, we may expect, with some confidence, that, in varying the ingredients, we may obtain a kind of glass, in which the differences will be smaller than in that which has hitherto been employed. The crown-glass M, for example, is of such a composition.

428. Calling 1 the aberration of an object-glass of crown-glass, No. 9, and flint-glass, No.

3, produced by the difference of dispersion relative to the different colors, this aberration becomes about 0·57 for an object-glass of the same focus, and composed of crown-glass, No. 9, and flint-glass, No. 13, and 1·74 with crown-glass, No. 9, and crown-glass M. In calculating these aberrations, he has taken into account the relative intensities of the differently-colored rays, of which we have already spoken.

429. The results given by two prisms of flint-glass, No. 23, show the degree of confidence which may be placed in the measured angles. With the prism of 45° made of this glass, a change of an arc of 2" produces a change of one in the fifth decimal of the index of refraction. With a prism of 60° it requires an angular

change of 8.5" to produce the same variation in the decimal.

430. If, in achromatic object-glasses, the aberration produced by the unequal refrangibility of the differently-colored rays ought to be destroyed; then, since the focal lengths of the lenses of flint and crown-glass ought to be nearly in the ratio of the dispersion of the two kinds of glass; and since, on the other hand, the ratio of dispersion for the different colors is not the same, it is evident that some aberration must still remain; and we must, therefore, determine this ratio, in order that this aberration may be a minimum for the distant vision of objects. This cannot take place, if the difference between the focal lengths for the rays of different refrangibility in the same object-glass is a minimum; for the different colors have not the same intensity: the aberration of the yellow rays, for example, which have the greatest brightness, will produce in the ratio of their intensity a worse effect than the violet ones, if the aberration for the latter is of the same magnitude. Hence we must know the intensity of each color in the spectrum, or in what ratio the impression of any color of the spectrum is stronger or weaker than that of another color. In order to measure this intensity, M. Fraunhofer constructed the following apparatus.

431. To an eye-glass, constructed for that purpose, for the telescope of the theodolite, he applied a small plain metallic mirror, the edge of which being well defined, cut the field of the telescope in the middle, as shown at *a* in fig. 15. It was placed before the eye-glass *E*, at an angle of 45°, and at the place of the image formed by the object-glass *A*. The eye-glass *E* is pulled out till the edge of the mirror, which ought to be vertical, is distinctly seen. At the side of the eye-glass, and in a direction perpendicular to the edge of the mirror *a*, and to the axis of the telescope *A E*, he fixed a tube *c B*, cut in the direction of its length at *b*; and in this cut he placed a narrower and a shorter tube *M N*, fig. 16, which crossed the larger tube *c B* perpendicularly. In this narrow tube was a small flame, in the axis of the larger tube, which was supplied with oil from an external vessel. The narrow vertical tube *b*, fig. 15, or *M N* fig. 16, had in the axis of the larger tube a small round aperture, turned towards the mirror *a*, by which the light of the flame fell upon it. By this contrivance, we perceive, in half of the field, the mirror *a* illuminated by the flame, and in the other half one of the colors of the spectrum formed by a prism placed before the object-glass *A*. The nearer the tube *b* is brought to *a*, the more will the flame illuminate the mirror,

and consequently we can obtain, at the same time, an impression produced on the eye by the light of the mirror (as seen by the eye-glass) of the same intensity as that which is produced by a color of the spectrum in the other half of the field. The squares of the distances of the flame from the mirror, for the different colors of the spectrum, are then inversely as the ratios of their intensity. Though at first it appears difficult to compare the light of two different colors, yet it becomes easy by a little practice. The intensity of the light of the mirror approaches more to that of any color in the spectrum, if, at the same position of the eye-glass, its vertical margin is less distinct. If the mirror is adjacent to a part of the spectrum, more or less illuminated, the edge of the mirror becomes, in both cases, more distinct; because, in the first case, the mirror appears to be placed in the shadow, and, in the second case, it is the color of the spectrum that is found there. The experiment with the mirror is a little difficult and uncertain, if we perceive clearly the lines of the spectrum, because the brightest and the darkest lines touch one another almost in every color. On this account the aperture in the window-shutter is made so broad that only the strongest lines are just visible, and the fine ones not at all. In place of the mirror outside of the shutter, by which the light entered, he put a white plane surface illuminated by the sun, because by any imperfection of the mirror the light is irregularly dispersed, which renders the observations more dubious.

432. In order to vary the experiments, he at one time enlarged the round aperture before the flame, and at other times contracted it. He placed at the end *c* of the wide tube, a piece of ground glass, through which the mirror received its light. In this case he measured the distances of the flame from the ground glass. To avoid all illusion the aperture before the eye-glass ought to be small, and to be at the place where the principal rays, or the axes of the rays coming from the edge of the field, cut the axis of the telescope. With the prism of flint-glass, No. 13, having an angle of 26° 24' 5", he obtained the following results. Though the experiments were made in clear weather, and at noon, he sometimes perceived, in the course of the observations, a slight change in the density of the light which the prism received. The differences of the four sets of experiments may have been partly owing to this change, and the flame may also have changed its intensity in the course of the observations. If we call the intensity of the light at the brightest part of the spectrum 1, we shall then have—

| Experiment I. | Experiment II. | Experiment III. | Experiment IV. | Mean of four Experiments. |
|------------------------|----------------|-----------------|----------------|---------------------------|
| Intensity of Light. | Int. of Light. | Int. of Light. | Int. of Light. | Int. of Light. |
| At B = 0.010 | 0.044 | 0.533 | 0.020 | 0.032 |
| At C = 0.048 | 0.096 | 0.15 | 0.084 | 0.094 |
| At D = 0.61 | 0.59 | 0.72 | 0.62 | 0.64 |
| Between D and E = 1.00 | 1.00 | 1.00 | 1.00 | 1.00 |
| At E = 0.44 | 0.38 | 0.61 | 0.49 | 0.48 |
| At F = 0.084 | 0.14 | 0.25 | 0.19 | 0.17 |
| At G = 0.010 | 0.029 | 0.053 | 0.032 | 0.031 |
| At H = 0.0011 | 0.0072 | 0.0090 | 0.0050 | 0.00056 |

433. The brightest part of the spectrum is nearly at one-third or one-fourth of DE from D. Its position cannot be determined more exactly, nor is it of any great importance.

434. The curve in fig. 14 represents the intensity of the light in the different colors. The above values are the ordinates, and the measured arcs BC, CD, in the table containing the measures of the angles obtained from different kinds of glass, &c., from flint-glass, No. 13, the abscissæ. We may suppose that the quantity of the light in the different colored spaces is represented by the areas of the curve BC, CD. If we call this quantity 1, for the area of the space DE, then we shall have—

| | |
|------------|---------|
| Area of BC | = 0.021 |
| CD | = 0.299 |
| DE | = 1.000 |
| EF | = 0.328 |
| FG | = 0.185 |
| GH | = 0.035 |

435. Having several object-glasses of the same aperture, the same focal length, and the same kind of glass, we may determine in which of them the aberration produced by unequal refrangibility is the best compensated, if we cover one-half of each of them by a screen passing through the centre of the object-glass in a straight line. In those where the margin of a distant object is most distinct the aberration is best compensated. In making this comparison we must attend only to the distinctness of the object, and not be deceived by the colors, because one object-glass may show less color than another, and yet its distinctness be less. This detailed method of finding the best ratio of dispersion is useful only for determining how much the aberration of the faintest rays ought to exceed that of the brightest rays. This result will be still more accurate if it is obtained by trials made with greater object-glasses, whose apertures are in the ratio of the greatest possible focal length. It is scarcely necessary to add, that the aberration of sphericity was corrected in all the object-glasses employed in these experiments. There is still another aberration which takes place in the eye itself, and to which we ought to pay attention if we wish to find the best ratio of the colorific dispersion.

436. On placing the red color of the spectrum in the middle of the field of the telescope of the theodolite, and on adjusting the eye-glass so as to be able to distinguish the fine micrometer wires, these wires will be no longer seen when the violet rays enter the field, the eye-glass remaining fixed. In order to see the wire in this color, we must bring the eye-glass much nearer the wire; that is, more than double the aberration produced by the unequal refrangibility of the two kinds of rays in the eye-glass. This proves that the differently colored rays in the eye have not the same focal distance, and that the eye is not achromatic. The distance to which the eye-glass ought to be displaced in different colors, in order to see the wire distinctly, enables us to calculate this aberration of the eye, which is by no means small; but we must take into account the aberration produced by the eye-

glass itself. It is scarcely necessary to state, that, in observations of this kind, no other light but that of the spectrum ought to enter into the field of the telescope, and that the wire should not receive any foreign light. M. Fraunhofer has found, with a lens of crown-glass, No. 13, with a focus of 0.88 Paris inches, that the eye-glass, in passing the wire from the ray C to G, ought to be displaced 0.054 of an inch, in order to see the wire with equal distinctness in both colors. A lens of crown-glass, No. 13, of 1.33 Paris inches focus, requires to be displaced 0.111 for the same colors; a lens of flint-glass, No. 30, with a focus of 0.867, requires a displacement of 0.074; and another of flint-glass, No. 30, and a focus of 1.338, required to be displaced 0.148 of an inch. In these experiments he looked with one eye at a fixed object, whilst with the other he observed at the wire through the lens, in order that he might be certain that, with the different colored rays, the eye was always equally susceptible of uniting on the retina white rays of a given divergency; and, consequently, that it did not change, in that respect, for the different colors. Even with that precaution, however, the results did not differ greatly from the preceding.

437. The result given by the first lens is, that, if the red rays fall parallel on the eye, the blue rays ought to diverge from a point 23.7 inches distant, in order to have in the eye the same focal distance. With the second lens this distance was 21.3; with the third 19.5; and with the fourth 17.9. In this calculation he has taken into account the influence produced on this displacement by the unequal refrangibility of the two kinds of rays in the lens. This aberration in the eye cannot be fixed more rigorously, but by varied and repeated trials. It would be desirable to have the experiments repeated on the eyes of different persons in order to obtain a mean result. In order to determine this aberration with still more precision, we must also take into account the diameter of the luminous cylinder formed by the rays which go from the eye-glass to the eye. The diameter of this cylinder varies, and depends on the aperture of the object-glass, and the focus of the lenses of the eye-glass. It is easy to conceive that this aberration increases with the diameter of the cylinder. Great care is therefore requisite, in the calculation of object-glasses, to attend to the aberration of the eye, and to make it disappear from the object-glass.

438. If, in the calculation of achromatic object-glasses for the spherical aberration, we wish to make this aberration disappear entirely, the indices of refraction for the flint and crown-glass ought to belong to the same colored ray; for if these indices belong to different rays the aberration can never be extinguished, notwithstanding the most rigorous calculation. As the discovery of the lines on the spectrum enables us to determine these points with accuracy, they must be considered of great utility in removing this aberration.

439. Before the discovery of the lines in the spectrum, M. Fraunhofer determined the identity of the refracting powers of two kinds of

glass by cementing them together, and forming them into a single prism. If the two specula seen by this prism appeared on the same place, and without any reciprocal displacement, he concluded that their refracting power was the same. After the discovery of these lines, however, he found that two pieces of glass might still have a different refractive power, without that difference being perceived by the above method. This difference in refracting power was not only found in pieces of glass taken from different parts of the same crucible, but even in pieces taken from the two extremities of opposite sides of the same piece of glass. By repeated experiments on the manufacture of flint and crown glass, he has succeeded to such a degree, that in a crucible containing 400 lbs. of flint glass, two pieces, one of which was taken from the bottom, and the other from the top, have the same refractive power.

440. In observing the great quantity of lines in the solar spectrum, we might be led to believe that the inflexion of light at the narrow aperture in the window-shutter had some connexion with them, though the experiments described do not give the least proof of this, and, indeed, establish the contrary opinion. In order to put this beyond a doubt, and also to make some other observations, he varied the experiments in the following manner :—

441. If we make the sun's rays pass through a small round aperture in the window-shutter, nearly 15" in diameter, and cause it to fall on a prism placed before the telescope of the theodolite, it is obvious that the spectrum seen by the telescope can only have a very small width, and consequently will form only a line. In a line, however, of almost no breadth, it is impossible to see the fine and delicate lines which transverse it; and, on that account, the fixed lines are not seen in a spectrum of this kind. In order, however, to see all the lines in this spectrum, it is necessary only to widen it by an object-glass, without altering its length. He obtained this effect by placing against the object-glass a glass having one of its faces perfectly plane, and the other ground into a segment of a cylinder of a very great diameter. The axis of the cylinder was exactly parallel to the base of the prism. The spectrum could not, therefore, change in its length, and was therefore only widened. In the spectrum thus altered he recognised all the lines occupying the very same position that they had when the aperture was long and narrow.

442. He employed the same apparatus for examining in the night time the planet Venus, without allowing the light to fall upon a small aperture.

443. In the spectrum formed by this light he found the same lines, such as they appeared in the light of the sun. That of Venus, however, having little intensity compared with that of the sun reflected from a mirror; the brightness of the violet and the exterior red rays is very feeble. On this account we perceive even the strongest lines in these two colors with some difficulty; but in the other colors they are easily distinguished. M. Fraunhofer has seen the lines D, E, b, F, fig. 14, very well terminated; and

he has recognised that those in *b* are formed of two, namely, a fine and a strong line. The weakness of the light, however, prevented him from seeing that the strongest of these two lines consisted of two; and, for the same reason, the other finer lines could not be distinguished.

444. With the same apparatus he has also made several observations on some of the brightest fixed stars. As their light was much fainter than that of Venus, the brightness of their spectrum was consequently still less. He has nevertheless seen, without any illusion, in the spectrum of the light of Sirius, three large lines, which apparently have no resemblance with those of the sun's light. One of them is in the green, and two in the blue space. Lines are also seen in the spectrum of other fixed stars of the first magnitude; but those stars appear to be different from one another in relation to these lines. As the object-glass of the telescope of the theodolite has only thirteen lines of aperture, these experiments may be repeated, with greater precision, by means of an object-glass of greater dimensions.

445. The electric light is, in relation to the lines of the spectrum, very different from the light of the sun and of a lamp. In this spectrum we meet with several lines, partly very clear, and one of which, in the green space, seems very brilliant, compared with the other parts of the spectrum. Another line, which is not quite so bright, is in the orange, and appears to be of the same color as that in the spectrum of the light of a lamp; but, in measuring its angle of refraction, M. Fraunhofer finds that its light is much more strongly refracted, and nearly as much as the yellow rays of the light of a lamp. Towards the extremity of the spectrum we perceive in the red a line of very little brightness; yet its light has the same refrangibility as that of the clear line of the light of a lamp. In the rest of the spectrum we may still easily distinguish other four lines sufficiently bright.

446. In making the light of a lamp fall through a narrow aperture, from 15" to 30" wide, upon a prism of great dispersion, placed before the telescope, we perceive that the red line of this spectrum is formed by two very delicate bright lines, similar in size and in distance to the two dark lines D, fig. 14. Whether the aperture through which the light of the lamp passes is wide or narrow, if we cover the point of the flame, and the lower blue extremity of it, the red line appears less clear, and is more difficult to be distinguished. Hence it appears that this line derives its origin principally from the light of the two extremities of the flame, particularly the inferior one.

447. The reddish line is, in relation to the other parts of the spectrum, very bright in the spectra of light produced by the flame of hydrogen gas and alcohol. In the spectrum of the flame of sulphur it is seen with difficulty.

448. Optical instruments in general have within the last century been brought to so high a degree of perfection that it may almost be doubted if there remain any real improvement to be made in them; nevertheless Dr. Goring states, that in the humble part of their con-

struction which provides against the admission of false light, there is still left some capability of a farther advancement towards perfection, which may be effected with advantage, to the performance of astronomical refracting telescopes, Newtonian reflectors, and compound microscopes.—As it is necessary to understand the nature of an evil before we can remedy it, as well as to feel the utility of removing it, we shall here give a slight account of the indistinctness occasioned by fog.

449. When we look through a telescope admitting false light, at a printed bill, the plate of a clock, or other such object, especially if the day is clear, and the sun shines on it, we find, however perfect the instrument may be in other respects, the letters or figures do not appear so black and sharp as when viewed by the naked eye under the same angle, but rather of a brownish color; in other words, the effect upon the eye is similar to that of looking through a mist, or through glasses dimmed by moisture; in short, what an ordinary observer would express by saying, that the instrument did not shew objects clear and distinct. Now, on examining the pencil of rays proceeding from the eye-piece of such a telescope, with a magnifier, it will (supposing no other source of indistinctness exists), be found surrounded by a variety of foreign rays, forming different haloes above it, instead of appearing like a spangle on a piece of black cloth, which it will do when all the light is stifled, as in Gregorian and Cassagrain reflectors by their eye-hole, and in refractors with erecting eye-pieces, which have a stop between the two bottom glasses, producing the same effect, by suffering nothing but the true and genuine pencil of light, from the object-glass or metal, to reach the retina. Indeed, in these instruments, the quantity of spurious rays would be so great as absolutely to preclude any thing like distinct vision, without the stops and eye-holes in succession.

450. In those to which Dr. Goring proposes to apply an equivalent contrivance for extinguishing fog, though there may not be the same imperious necessity for its application, still he thinks the advantage to be gained by the improvement is not to be despised, but will rather be admitted to be highly useful and appropriate, as placing optical instruments one step nearer perfection than they otherwise would be, by producing the maximum of distinctness and clearness of vision, of which they can be rendered susceptible, consistently with their excellence in other respects. Opticians have not been entirely insensible to the advantages to be obtained by excluding all inefficient light; being aware that no kind of blacking, applied to the inside of an optical tube, is sufficient to effect that salutary purpose, they have had recourse to other means, though inadequate to the end in view. Thus it is common, in a refracting astronomical telescope, to meet with one stop and sometimes two, placed in the interval between the object and eye-glass; the apertures of the magnifiers are likewise contracted on the same principle. But these stops are never in sufficient number, or sufficiently contracted, or

placed in such situations as they should be to be efficient. Dr. Goring states that it seems to him as if they were possessed of some superstitious dread of cutting off some of the light of the object-glass by inserting stops; or perhaps have wished to show their customers that the apertures of their glasses were clear, it being a common trick to make a large object glass, and then to cut off the effect of the imperfect edges by a contrivance, such as has been mentioned, which ordinary purchasers are not aware of, and thus suppose the instrument to be much finer and better than it really is; at least it is not uncommon to meet with this species of fraud in the works of the continental artists, who are very fond of making larger object-glasses than the English workmen.

451. To enter, however, into the subject, we shall here, as succinctly as possible, describe the method which Dr. Goring experimentally found to answer best for stifling fog in the astronomical refractor. It is a consideration which must obviously present itself, that, if an eye-hole be placed at the end of a telescope, precisely of the size and exactly in the focus of the pencil of rays produced by any particular magnifier, the end here proposed will be attained, as in the Gregorian and Cassagrain telescopes; it will, moreover, confine the eye truly to the axis of the tube, and thus prevent us from seeing any of that color in the image, which may always be perceived in the best instruments when the eye is a little removed from its true situation. Nevertheless, after sufficient trial, Dr. Goring rejected this method, as less expedient than the following, on account of the difficulty of executing it properly with high powers, as well as that it confines the field of view, and is disagreeable to the eye. It is evident, that with high powers the pencils of rays will be exceedingly small; therefore, if the aperture of the eye-hole is too large, it will be ineffectual, if too small it will obstruct light; it must, therefore, be executed to a very great nicety, which is not always to be expected; besides, in a case of such delicacy, if the eye-piece be not screwed on to a particular mark on the body of the tube, or if any of the parts of which the magnifying apparatus is composed be more or less screwed home than at the time of adjustment, it will be highly probable that the eye-hole will be a little thrown out of its true situation, and thus do away with the sole object for which it was constructed. Thus it is that what is perfect in theory will not always answer in practice. As to using eye-glasses with very small apertures for the same purpose (as contradistinguished from eye-holes placed at the ends of the cones of light, drawn to a point by the magnifiers), it is a method which cannot be made to exclude false rays with any degree of precision, even though their diameters are so much reduced as greatly to contract the field of view.

452. We shall now give an account of the plan which Dr. Goring has selected as most eligible, and which he has applied to a thirty inch, and eighteen inch refractor with complete success. Fig. 1, Plate VI., is an engraving of the section of a refractor, in which may be seen seven

S

stops in the course of the tube and eye-piece (exclusive of the field bar), five of which are placed in such a manner, and of such apertures, as to pinch the cone of rays proceeding from the object glass as tight as possible, without intercepting any. It will be obvious that no foreign rays, or rays that are not parallel, will be able to find their way to the eye, nor can any light be reflected from the sides of the tube, so as to become visible. To execute this, use the following method:—When the telescope is finished in the usual way, and before any stop is inserted, attach its lowest astronomical eye-piece to it, and find the true solar or sidereal focus of the object-glass: when thus adjusted, measure carefully with a dynameter the size of the pencil of rays proceeding from the eye-piece, and note it down. Having then procured a plank of wood, covered with paper of sufficient length, take the aperture of the object-glass, and set it off at one end of the board; bisect it and draw a line at right angles to it, to the exact length of its focus; fix three strong needles into the three points of the focus and aperture of the object-glass, and then stretch a fine thread over them, which will then represent the cone of light which forms the image; set off six or seven inches from the focal extremity (an efficient stop cannot be placed nearer without contracting the field of view), and ascertain the distance between the threads at this point, which will give the diameter of the fifth stop. Then divide the remainder of the focal length into five equal parts, and the distance of the threads will give the diameter of four more stops, 4, 3, 2, and 1, in the figure, all sufficiently correct for the purpose. The stops are then to be made and inserted into the tube in their proper places; it will not, however, be amiss to make No. 1, 2, 3, and 4, a little too large, and to confide the main business of stopping the false rays to No. 5, which may be attached to the eye-tube, and move along with it, in adjusting the focus of the magnifier. This will give the instrument the power of adjusting itself to nearer objects on the earth, without losing any light from the effect of the stops, which otherwise must be adjusted to the shortest focus of the object-glass, and supposed to act perfectly only with parallel rays. It will not be amiss to have a very small eye-hole, placed correctly in the focus of the object-glass, which will give a great facility of adjusting the stops, as it will show, by merely looking through the instrument, if they are correctly placed or not. Lastly, having fixed these, apply the eye-piece, carrying the lowest magnifier as before; and again, with the dynameter measure the size of the cone of rays at the eye; if it measures precisely as before, you may be quite confident you have cut off no true light. Probably it will be thought there is already a superabundant quantity of stops, but, on examining the pencil with a magnifier, it will most likely be found that some false light is still reflected from the eye-tube; to remedy which, two more stops will be necessary as Nos. 6 and 7; both of these, however, must be larger than No. 5, and No. 7 the larger of the two, or the field of view will be contracted in the low powers. The

higher the power, the nearer an efficient stop may be placed toward the focal extremity of the pencil, proceeding from the object-glass; the lower it is, the farther the stop must recede, gradually of course, increasing in its aperture (unless the length of the eye-tube is increased in proportion to the focus of the magnifier employed). The distance of the main stop is fixed upon six or seven inches, which will suit all telescopes, and all magnifiers which are not more than one inch in focus. Here it seems proper to observe that when once the false light is duly excluded from a telescope, in the manner here recommended, the eye-glasses may be used of any aperture, and thus the field of view may be had of any size, even with a single eye-glass, which, when high magnifiers are used, is a great convenience, as it enables us to keep a celestial object in sight more easily, though we should only see it distinctly in the axis of the telescope; moreover, should it not be thought worth while to have the false light as perfectly excluded, as it possibly can be under all circumstances, the stops Nos. 1, 2, 3, and 4, may be rejected, and 5, 6, and 7 only executed; the consequence will only be, that some false light will be rendered sensible when the eye is not confined to the centre of the eye-glass.

453. We have given the full complement of stops, to render the exclusion as complete as possible. A good method of illustrating the effect of the stops is the following:—It is known that a terrestrial telescope, with an erecting eye-piece of four-glasses, would be rendered nearly useless by withdrawing the little stop placed between the two glasses which erect the image, by the quantity of fog which would be let in, supposing the instrument to be constructed in the usual way. But, in a telescope with such stops as above described, it is of no consequence whether the little stop is introduced or not, the performance being precisely the same in point of distinctness in both cases. In performing this experiment it is necessary, however, that the aperture of the little stop should be correctly and truly accommodated to the size of the pencil, which is formed by the glass, in the focus of which it is placed, so that it shall barely admit the image of the object-glass without cutting any of the side rays off, otherwise the experiment will not be fair. Opticians are apt sometimes to make these apertures so small as to intercept some of the light of the object-glass as effectually as a cap over the end of it would; for the achromaticity of an erecting eye-piece depends very much upon the size of the little aperture in question. Thus, where the diameter of an object-glass bears a very large proportion to its focal length, it will be impossible to admit the whole of the light proceeding from it into the eye-tube, without at the same time destroying the achromatic property of the latter, by the necessity which would arise of opening this stop too wide to consist with it. In the experiment we have detailed there is sufficient proof that the effect of the stops is equivalent, indeed more than equivalent, to that produced by the stop which is inserted in erecting eye-pieces for the purpose of procuring distinct

vision. The doctor observes 'Is there any merit in having effected, by means of half a dozen stops, what may be done well enough by one? certainly not. But take away the erecting eye-tube, screw on an astronomical eye-piece (either with or without a field bar), and where, I ask now,' he continues, 'is that part of structure which is to do the work that was performed in the erecting compound magnifier, now removed by the little stop of which I have said so much, supposing the telescope constructed in the usual manner, that is to say, without stops in the course of the focal distance of the object-glass, or at least without effectual ones?' It cannot be asserted that there is any thing equivalent in the instrument in its present condition to the former provision in it, for the valuable purpose of excluding false rays, though the expediency and utility of it in both cases must be equally admitted or denied, and it is clear that this can only be supplied in the astronomical telescope, by some such expedients as above resorted to.

454. As we conceive no one will be hardy enough to assert that there is no use in excluding false rays from a telescope intended to be used at night, for viewing the heavens, it will be superfluous for us to set about proving that we shall see a celestial object the better if no light, either direct or reflected, reaches the eye, save that actually proceeding from it. If the light of the heavens in a star-light night, and that of the bodies which produce it, are very faint, still there is the same ratio between their brightness and the false light they produce, though perhaps not so conspicuous as there is in that of terrestrial objects. Indeed it is perfectly well known to astronomers that, in the darkest night, wearing a black hood over the eyes greatly facilitates the vision of very faint and delicate objects, such as nebulae, &c., from the sensibility and tranquillity endured by these means in the retina, rendering it susceptible of the slightest impressions. Surely the effect of foreign light reaching the eye directly, or through the medium of a telescope, must be equally pernicious. It is in viewing the class of objects here designated that the utility of the stops we have described will be found; no one will expect that they can render a telescope better able to define or divide a star, because these properties depend upon the perfection of an entirely different part of its structure.

455. The Newtonian telescope has, among its other valuable peculiarities, that of having less false light in it than any other kind of telescope. The same striking effect, therefore, will not be manifest in excluding the trifling fog there is in it, as in another construction where it is more abundant. Nevertheless, there is something to be done. If we examine the pencil of rays proceeding from its eye piece with the magnifier, it does not precisely represent the image of a spangle on a piece of black cloth as it should do; a good deal of foreign light may be seen, formed partly by the side of the tube behind the diagonal metal, and partly by such portion of the end next the large mirror as the plain one can reflect along with the image, together

perhaps with some reverberated by the little tube which carries the magnifiers.

456. In fig. 2 is represented the method taken to remedy these imperfections in a seventy-seven inch focus, and seven inch aperture, Newtonian. The alterations from the common construction are as follows:—The tube which carries the magnifiers is seven inches long, instead of being only two inches or perhaps less, as is usual,—the diagonal metal is likewise placed nearer than usual to the large one, so that the length of the telescope is reduced about five inches; this is of course necessary to render the pencil of rays, reflected at right angles from the axis, long enough to act with the increased length of the eye-tube. As the diameter of the spectrum of the great mirror increases as we recede from its focal extremity, more of the small plain one will in this case be called upon to act; it, however, will still do the work without any increase in its size. By this arrangement a sufficient length of eye-tube is obtained to insert the stops 5, 6, and 7, as in the refractor; No. 5 is the efficient stop as before, and is seven-twentieths of an inch in diameter. The extrusion of the aberrant light is complete as long as the eye is in the axis of the instrument.

457. It would of course be impossible to insert any stops similar to those, 1, 2, 3, and 4, in the refractor, to render the effect more complete; nevertheless, Dr. Goring thinks, were it any object, a Newtonian would, by the aid of the contrivance he applied to his, act sufficiently well with a skeleton tube only. It now remains to describe the new adjustment which so long an eye-tube requires; for it is evident that any want of centricity and parallelism in the lenses composing the eye-glass to the axis, which might be tolerated in a very short tube, will be perfectly insupportable when aggravated by a longer one; moreover, the stop No. 5 will, if not truly concentric with the cone of light on which it operates, evidently impede some, as in such a case is perceptible by looking through the small eye-hole recommended in adjusting the refractor, or by examining the extreme pencil after it has passed the eye-glass with a magnifier. It is evident that the adjustment of a Newtonian is complete, when the pencil of rays which is reflected from the small metal truly perforates the axis of the eye-tube, and the centres of the lenses composing it; it matters not at what angle or in what direction the said cone of rays proceeding from the large metal be thrown by the diagonal one, provided these conditions are fulfilled (supposing, of course, the position of the small metal to be the centre of the tube, so that it shall truly receive the whole of the light of the great one). We may, therefore, either adjust the small metal to the eye-tube or the eye-tube to the small metal, or we may do both, which latter will probably be the most expedient; Dr. Goring has effected it in a very simple manner, by having the tube made to fit loosely into another wider piece, which is screwed on in the usual way, to the side of the telescope; the vacancy between them is filled up with wax, the inner tube is tight at the bottom of the ex-

ternal one by the interposition of a small setting chamfered at the edge, but admits of a slight rotatory motion towards the eye-glass by heating the wax with the flame of a candle, which is inserted into the external tube, and which unites them both together; time will be given to adjust it before the wax cools, when it will all set tight, and will not be liable to get out of order. Two small niches should be made, one in the shoulder of the screw of the external tube, and the other in that of the female screw to which it is applied, to be a guide that the two pieces may always be screwed home to a particular point; or it is very probable the adjustment may be spoiled, because it will be a chance if the eye-tube when fixed, is precisely at right angles to the side of the telescope. A variety of methods of effecting this adjustment will present themselves to the workman. Thus, instead of the wax, three screws might be used, fixed into the external tube; or such a contrivance as is represented in fig. 2, by having counter screws to play against those by which the setting for the eye-piece is attached to the rackwork, on the side of the telescope, &c. To conclude, as an Herschel telescope is nothing but a Newtonian, used without the interposition of a small metal reflector, whatever has been said of the latter, will equally apply to it, and the same principle in the eye-tube and adjustment will for the same reasons be equally adapted to both, though the manner of execution will be different.

458. Microscopes, though but toys compared with telescopes, nevertheless deserve to be rendered as perfect as possible; for they yield not to them in the quantity and variety of rational amusement which they are capable of introducing to us (though not of the sublime description of the wonders of the heavens). Compound microscopes, though not so much to be depended upon for the purposes of discovery and philosophical investigation as single lenses, are still best adapted for recreation; but all those constructed on the common principle are so full of fog as to be quite disagreeable for examining opaque objects, which render this defect more striking than transparent ones. This false light results from the custom of making the object-glass of a very small aperture, instead of giving it a larger one, and placing a stop in its proper place (the focus of the lens employed). It is totally impossible to get rid of the fog in any other way. No doubt the larger the aperture of the lens of the common object-glass, the more indistinctness is sensible; and the more it is reduced, the less; but no practical construction of the aperture will effect the desired purpose completely, because the principle is itself intrinsically bad, and incorrect at least for low powers.

459. Now, if we form a microscopic object-glass of a single lens of considerable aperture, having a stop in its focus of about the same diameter as the apertures of the common lenses used for compound microscopes, that is to say, about one-tenth or one-twelfth part of their focal distance, we shall form an object-glass which gives a clear image, free from fog indeed,

but very deficient in other respects; for, the stop being placed where the rays cross each other, a large portion of the aperture of the lens is called into action in comparison to what is usually made use of, when it is at once limited by a stop of the same diameter applied close to the glass; the aberrations both chromatic and spherical are here immediately felt; to remedy these, another lens must be employed, the best position for which is close to, or very near the farther side of the stop. The focus of it must be to that of the first as three to two, or as two to one; for low powers, however, it may be about two and a half to two; for the higher, the best proportions seems to be as two to one. The lenses employed should be plain convex, having their curves towards each other as represented in figs. 3, 4, 5, and 6, which are drawings of four object-glasses of this description which Dr. Goring caused to be executed; the lowest power is two inches focus, the highest half an inch; the foci of the lenses, and the size of the stops, &c., are as there represented. These object-glasses are bright, clear, and distinct, free from spherical aberration, and will show no sensible color with opaque objects of any kind, not even with so trying a one as the enamelled white letters on a black-ground generally used by opticians to try their telescopes with. When, however, they are made to view an object illuminated from behind, which does not suffer the light to pass through it while its edges are seen, as for example the legs of some insects, some kinds of moss, &c. which have very little transparency, the uncorrected color is then decidedly seen; such objects are the best tests of achromaticity for telescopes as well as microscopes; equivalent terrestrial ones for a telescope will be the bars of a window seen from the interior of the apartment to which it belongs, or the naked branches of a tree in winter, seen against the light of the sky, more especially of the sun, and nearly opposite the observer. In addition to the four object-glasses, above described, Dr. Goring has two more of one-fourth and one-eighth of an inch focus, which are not inserted, because, although executed with the utmost care, they are no better than the common ones. Dr. Goring states that he was grievously disappointed with these; for he had fully expected that the same principle applied to deep object-glasses would form as superior an object-glass for high powers as for low ones; however, the reverse is the fact; it is one of those things which can only be learnt from experience, and could not have been predicated *a priori*. Still, therefore, the common object-glass is the best for high powers, viz. for those of a quarter of an inch focus, and upwards. There are, nevertheless, many transparent objects which cannot be seen without object-glasses of at least one-tenth of an inch focus; such are many kinds of animalcules and the minute lines on the dust of a butterfly's wing, &c. For these the common single lens of small aperture will perhaps ever remain the only efficient object-glass; an equivalent power obtained with Dr. G.'s object-glasses, or those of the common construction of similar focus, by

increasing the depth of the eye-glass will never show the objects in question, because what may be called the penetrating power of a compound microscope depends upon the depth of its object-glass, as that of a telescope upon the aperture of the metal or glass which forms the image viewed by the eye-glass. The eye-glass, either of a microscope or telescope, merely develops what is contained in the image it enables us to view; it cannot of course render any thing sensible to our sight which does not exist in the spectrum formed by the object-glass or metal.

460. We may here advert to a circumstance, relative to the proper apertures of the common microscopic object-glasses, which is, perhaps, not duly attended to. It is certain that the more their apertures are reduced (within a certain point) the more fog you exclude; and in this way you improve the instrument; yet, if this reduction is pushed too far, it will prevent you from seeing a certain class of objects, even while the vision of others seems to be ameliorated. Thus the parallel lines on the dust or feathers of a butterfly's wing can be just seen with an object-glass of one-tenth of an inch focus, and one-twenty-fifth of an inch aperture, as it can be measured: if, however, this aperture is very slightly contracted, they can no longer be seen with any art or management of the light; at the same time other objects will appear foggy and indistinct with this same aperture, especially if opaque, and the vision of them will be improved by diminishing it. Dr. Goring thinks, therefore, that the apertures should be regulated by this ratio of one-twenty-fifth of an inch aperture to one-tenth of an inch focus.

461. In figs. 7, 8, and 9, are representations of some silver cups for holding very deep single lenses, intended to view opaque objects. It is generally supposed that single lenses will show objects perfectly clear and without fog, but this is not the case unless their apertures are very small; lenses of $\frac{1}{30}$, $\frac{1}{40}$, $\frac{1}{50}$, and $\frac{1}{60}$ th of an inch focus require their apertures to be so much reduced to show opaque objects clearly, that it is scarcely possible to see at all with them from the want of light. These cups were so contrived to remedy this defect as far as it is practicable; their radius is only one-fourth of an inch, their focus consequently. These condense light much more than the larger cups commonly used, and illuminate much more powerfully. It is true that they only enlighten a small portion of an object, but then we can only see a very small portion with such deep lenses as they are intended to hold; they are not so small but that they may be made to receive and condense the whole of the light proceeding from a bull's-eye lens placed at a proper distance from them, and in this way, with no other light than that of a common candle, Dr. Goring has been enabled to see an opaque object well with a compound microscope, having an object-glass of only one-thirtieth of an inch focus set in one of them, with only a moderate aperture. A lens of one-sixtieth of an inch set in this manner, used as a single lens, likewise shows opaque objects in a manner which leaves nothing to be desired.

462. It is necessary, however, for the stops between which the lenses are placed to be very accurately made. They should be turned out of a piece of solid brass, the external one very thin, and the holes so correct as always to coincide with each other when the stops are turned round; the apertures must be quite free from burrs; in addition to which the stops must be so adjusted that the focus of the lens and that of the cup may precisely correspond, otherwise the benefit of the cup is in a great measure lost. Fig. 9 will carry one-eighth or one-tenth of an inch without any stop at all, which is a great convenience; for the lens is in this case close to the eye, and the field of view larger in consequence: the stops for the deeper lenses are much shorter than they would be with larger cups, so that the field is increased in the same way, and the eye much less strained in using them, than it would be were the lens farther off from it.

463. We may now notice the monochromatic lamp contrived by Dr. Brewster for microscopical and other purposes, with an account and description of which he furnished the Royal Society of Edinburgh, and which is inserted in vol. IX. p. 433 of their Transactions. Our limits will not admit of the elaborate account of this important invention presented to the society, but the following abridgment of the paper will enable our readers to fully appreciate its value.

464. Dr. Brewster observes that in a paper on Vision through colored glasses, which he submitted to the society, he pointed out the advantages of colored media in microscopical and telescopic observations. Having experienced the great utility of green and red lenses, in developing vegetable structures that required to be examined with high powers, he was anxious to derive from this new principle all the advantages which it appeared to possess. In attempting to do this, it became necessary to ascertain the power of giving distinct vision, which belonged to each separate color of the spectrum; and though he had stated in his former paper, that it was difficult to discover any reason why one colored medium should be preferred to another, provided each of them transmit equal quantities of homogeneous light; yet it was desirable to put this theoretical opinion to the test of direct experiment. Sir William Herschel had long ago investigated this point, in reference to the use of colored media for solar observations, and had concluded that every color of the spectrum possessed the same power of giving distinct vision; but his method of observation, which consisted in viewing through a microscope a nail illuminated in succession with each of the colors of the prism, was by no means calculated to give definitive results, and therefore left the question in all its uncertainty.

465. In order to obtain precise indications, which were not capable of being misinterpreted when applied to practical purposes, Dr. Brewster formed a spectrum from a luminous disc, by means of a prism of a highly dispersing substance, and with a large refracting angle. He then examined this spectrum through a great variety of colored media, both solid and fluid,

and marked the size and shape of the image into which it was converted. The perfection of this image, or its narrowness in the direction of the length of the spectrum, became a precise and unequivocal test of the fitness for distinct vision which belonged to the light out of which it was formed.

466. By this method of observation he found that a distinct image of the luminous disc could not be obtained either by producing a blue or a green image, and that it was only in the red portion of the spectrum that such an effect was likely to be obtained. In the use of purple glasses it was observed that the middle portion of the red space was absorbed before the two extreme portions, so that instead of one red image there were two quite separate, and tolerably distinct. By increasing, however, the thickness of the plate, the most refrangible red image was absorbed, and the least refrangible one left in a state of the most perfect distinctness. Although he had now determined the part of the spectrum that was best fitted for giving perfect vision, yet the quantity of light extinguished before the insulation of the extreme red ray was affected was so great as to render the determination of little practical utility, excepting in cases where the outline of an object was to be observed. Had it been possible to insulate the most luminous rays of the spectrum as perfectly as the extreme red ones, the advantage would have been of very considerable amount; but he found this quite impracticable.

467. Abandoning, therefore, all hopes of obtaining from colored media any farther improvement upon the microscope than what had been formerly announced, it occurred to Dr. Brewster that the object which he had in view might be obtained, if he could procure from the combustion of inflammable substances a homogeneous flame for illuminating microscopic objects.

468. It had long been known that a great quantity of homogeneous yellow light was created by placing salt or nitre in the white flame of a candle, or in the blue and white flame of burning alcohol. A light, however, generated in this manner, was more fitted for a casual experiment than for a permanent source of illumination; and, as insalubrious vapors are disengaged during the combustion of these salts, he did not avail himself of this method of obtaining yellow light.

469. After numerous experiments, attended with much trouble and disappointment, he found that almost all bodies in which the combustion was imperfect, such as paper, linen, cotton, &c., gave a light in which the homogeneous yellow rays predominated; that the quantity of yellow light increased with the humidity of these bodies; and that a great portion of the same light was generated when various flames were urged mechanically by a blow-pipe or a pair of bellows.

470. As the yellow rays seemed to be the product of an imperfect combustion, Dr. Brewster conceived that alcohol diluted with water would produce them in greater abundance than when it was in a state of purity; and, upon making the experiment, found it to exceed beyond his most sanguine expectations. The whole

of the flame, with the exception of a small portion of blue light, was a fine homogeneous yellow, which, when analysed by the prism, exhibited faint traces of green and blue, but not a single ray of red or orange light. The green and blue rays, which accompanied the yellow flame had comparatively so little intensity, that they disappeared in the processes of illuminating and magnifying the object under examination; and, even if they had existed in greater abundance, it was quite easy to absorb them at once by the intervention of a plate of the palest yellow glass, and thus render the lamp perfectly monochromatic.

471. From many experiments on the combustion of diluted alcohol he found that the discharge of yellow light depended greatly on the nature of the wick, and on the rapidity with which the fluid was converted into vapor. A piece of sponge, with a number of projecting points, answered the purpose of a wick better than any other substance, and the extrication of the yellow light became more copious by placing a common spirit-lamp below the barrier of the other. In order to obtain a very strong light, for occasional purposes, he connected with the top of the burner a frame of wire-gauze, which by moving vertically round a hinge, or by a motion to one side, could be placed in a horizontal position, about half an inch above the wick. As soon as it had become red-hot it was made to descend into contact with the sponge, when it converted the alcohol rapidly into vapor, and produced an abundant discharge of yellow light.

472. If a permanently strong light is required, it is found preferable to dispense entirely with the use of the wick, and to allow the diluted alcohol to descend slowly from the rim into the bottom of a concave dish of platinum, kept very hot by a spirit-lamp placed beneath it. The bottom of the dish is made with a number of projecting eminences, in order that the film of the fluid which rests upon it may be exposed at many points to the action of the heated surface. After the lamp has burned for some time, a portion of unevaporated water, mixed with a small quantity of alcohol, will remain at the bottom of the dish, in a state unfit for combustion. This water may be taken up by a sponge, or it might be prevented from accumulating, by having a fountain of pure alcohol, from which the exhausted strength of the diluted fluid could be renewed.

473. The monochromatic lamp being thus completed, Dr. Brewster lost no time in applying it to the illumination of microscopic objects. The effect which it produced far exceeded his expectations. The images of the most minute vegetable structures were precise and distinct, and the vision in every respect more perfect than it could have been, had all the lenses of the microscope been made completely achromatic by the most skilful artist.

474. Independent of its use in microscopical observations, the monochromatic lamp will find an extensive application in various branches of the arts and sciences. In certain cases of imperfect vision, where a number of colored images

are formed by the separation of the fibres of the crystalline lens, a homogeneous light will improve the vision, by removing the prismatic tints, which obliterate the principal image. In illuminating the wires of transit instruments and micrometers; in graduating the limbs of divided instruments, which is generally done by candle-light; in reading off the same divisions in fixed observations; in forming signals in trigonometrical surveys; in obtaining correct and uniform measures of refractive powers; in measuring the separation of the two pencils in doubly-refracting crystals; in determining the focal lengths of lenses; in observing various optical phenomena, where the light is decomposed; in these, and in general in all delicate works, where correct vision is essential, the employment of a homogeneous flame will be found to confer the most signal benefits.

475. Fig. 10 represents one form of the monochromatic lamp, where A is the reservoir containing the diluted alcohol, which descends by the channel ABCD to the broad wick E, which is generally made of sponge. A frame of wire-gauze F moves round a hinge H, so that it can be brought over the flame, and made to descend, when hot, upon the surface of the wick. Excellent wicks may be made with concentric cylinders of thin mica, or of platinum foil.

476. Fig. 11 is another form of the lamp, without a wick, in which the diluted alcohol is burned in a flat platinum or metallic dish MN, which may be made to have a slight spontaneous oscillatory motion, for the purpose of bringing the fluid over the heated projections of the platinum. A common spirit-lamp OP, enclosed in a case, is placed below the platinum-dish MN, in order to produce sufficient heat for throwing off the vapor from the diluted alcohol. A chimney, or a cylinder, of pale yellow glass may be placed round the flame, if it should be thought of some consequence to absorb the small portion of blue light which accompanies the yellow flame.

477. The photometric instrument we are now about to describe is likely to be of the utmost importance in the science of optics, and as Mr. Ritchie has just furnished the Royal Society with an account of the theory on which it is constructed, as well as the delicate minutæ essential to its completion, our readers may for a few billings readily construct a similar apparatus.

478. The instrument consists of two cylinders of planished tin plate, from two to ten or twelve inches in diameter, and from a quarter of an inch to an inch deep. One end of each cylinder is enclosed by a circular plate of the same metal, soldered completely air-tight, the other ends being shut up by circular plates of the finest and thickest plate glass, made perfectly air-tight. Half way between the plates of glass and the ends of the cylinders there is a circular piece of black bibulous paper, for the purpose of absorbing the light which permeates the glass, and instantly converting it into heat.

479. The two cylinders are connected by small pieces of thermometer-tubes, which keep them steady, with their faces parallel to each other, but turned in opposite directions, and all serve

to make the insulation as complete as possible. The chambers are then connected by a small bent tube in the form of the letter U, having small bulbs near its upper extremities, and containing a little sulphuric acid, tinged with carmine. The instrument is supported upon a pedestal, having a vertical opening through the stem, to allow the glass tube to pass along it, and thus secure it from accidents.

480. A small scale divided into any number of equal parts is attached to each branch of the tube. In plate VII. fig. 1, ABCD and EFGH are the cylinders; AB, and FG, the plates of glass. CD, EFG, the ends shut up by the cylinder tin plates: the blackened paper is represented by the lines between AB, CD, and EH, FG. The other parts will be obvious from the mere inspection of the figure.

481. The accuracy of the instrument evidently depends upon the perfect equality of its two opposite ends. To ascertain if it be accurately constructed, place it between two steady flames, and move it nearer the one or the other, till the liquid in the tube remains stationary at the division of the scale at which it formerly stood. Turn it half round, without altering its distances from the flames, and, if the liquid remains stationary at the same division, the instrument is correct. To show the extreme delicacy of the instrument, place it opposite a single candle, and it will be sensibly affected at the distance of ten, twenty, or thirty feet, provided it be of sufficient diameter, whilst it will not be sensibly acted upon at the same distance by a mass of heated iron affording twenty times the quantity of heat. In order to cut off effectually the influence of mere radiant heat, I sometimes use screens composed of two plates of glass, placed parallel to each other, with a quantity of water interposed.

482. Place the instrument between any number of steady lights whose intensities are known: as, for example, between four wax candles opposite one end, and one candle opposite the other, and move the photometer till the fluid remains stationary at the division where it formerly stood, and it will be found that the distances are directly as the square roots of the number of candles; or, in other words, that the intensities of the lights will be inversely as the squares of the distances. If gas lights be employed having burners capable of consuming known quantities of gas in equal times, and the photometer be placed between them, so that the effect upon the air in each chamber shall be the same, it will be found that the quantities of gas consumed by each will be exactly proportional to the squares of the distances of their respective flames from the end of the photometer.

483. This instrument seems well adapted for determining the relative quantities of light given out by the combustion of coal and oil-gas. Place the instrument as before between the two burners, and ascertain the relative intensities of the two lights, by squaring their distances from the adjacent ends of the instrument; ascertain the quantities of gas consumed by each of the burners in the same time; multiply these quantities by the squares of the respective distances, and

the product will be the relative quantities of light afforded by the gases. Let d be the distance of the coal-gas light, and d' that of the oil-gas light; and let q be the quantity of coal-gas consumed in a given time, and q' the quantity of oil-gas consumed in the same time, then the intensity of the coal-gas will be to that of the oil-gas $q d^2$ to $q' d'^2$.

484. To find the ratio between the quantities of light given out by the sun and that afforded by a common candle, place one end of the instrument opposite the sun, and bring the candle opposite the other end, till the fluid in the stem remains stationary at the original division; and the light given out by the candle, will evidently be to that given out by the sun, as the square of a few inches to the square of the number of inches contained in 95,000,000 miles, provided none of the sun's light had been absorbed in its passage through the atmosphere. The delicacy of the instrument is such that, if it be placed opposite the sun without a counteracting force, the light absorbed from the body will be so great, as to cause the liquid to move through a tube twenty or thirty feet long. By covering one end of the instrument and directing the other to various quarters of the sky, we can ascertain the relation between the quantities of light reflected from the atmosphere and clouds floating in those regions.

485. Though this instrument has some resemblance to professor Leslie's photometer, yet it is founded on principles essentially different: the one depending on the difference of the temperatures of the two bulbs, whilst the perfection of the other results from the equality of the temperature of the air contained in both chambers. The one has a scale a few inches long attached to one end of the vent tube, whilst the scale of the other is the distance between the two antagonist flames. The delicacy of the one is, from its very nature, combined within very narrow limits, whilst that of the other may be increased at pleasure.

486. Having thus furnished a brief outline of the most valuable new instruments, we cannot better conclude our general view of this important science than by furnishing our readers with a few experiments illustrative of the subject.

487. The *cistula* is a machine or apparatus whereby small bodies are represented extremely large, and near ones extremely wide, and diffused through a vast space, with other agreeable phenomena, by means of mirrors, disposed by the laws of catoptrics, in the concavity of a kind of chest.

488. Of these there are various kinds, accommodated to the various intentions of the artificer: some multiply the objects; some deform; some magnify, &c. The structure of one or two of them will suffice to show how many more may be made.

489. If we wish to make a catoptric cistula to represent several different scenes of objects, when viewed at different holes, it is only necessary to provide a polygonous box, of the figure of the multilateral prism, $ABCDE$, in the following diagram, and divide its cavity by diagonal planes EB , EC , DA , intersecting each other in the centre into as many triangular locules, or cells, as the chest has sides. Line these diagonal planes

with plane mirrors: in the lateral planes make round holes, through which the eye may be directed within the cells of the box. The holes are to be covered with plain glasses, ground within, but not polished, to prevent the object, in the cells, from appearing too distinctly.

In each cell are to be placed the different objects whose images are to be exhibited; then covering up the top of the box with a thin transparent membrane, or parchment, to admit the light, the machine is complete.

490. For, from the laws of reflection, it follows, that the images of objects, placed within the angles of mirrors, are multiplied, and appear some more remote than others; whence the objects in one cell will appear to take up more room than is contained in the whole box. By looking, therefore, through one hole only, the objects in one cell will be seen, but those multiplied and diffused through a space much larger than the whole box; thus every new hole will afford a new scene: according to the different angles the mirrors make with each other, the representations will be different: if they be at an angle greater than a right one, the images will be distorted.

491. The parchment that covers the machine, may be made pellucid, by washing it several times in a very clear ley, then in warm water, and bracing it tight, and exposing it to the air to dry. If it be desired to throw any color on the objects, it may be done by coloring the parchment. Zahnus recommends verdigris ground in vinegar for green; decoction of Brasil wood for red, &c.

492. Let us now, however, point out how to make a catoptric cistula to represent the objects within it prodigiously multiplied, and diffused through a vast space. To construct this amazing apparatus, take a chest, as in the above engraving, but without dividing the inner cavity into any apartments, or cells; line the lateral planes $CBHI$, $BHLA$, $ALMF$, &c., with plane mirrors, and at the foramina, or apertures, pare off the tin and quicksilver, that the eye may see through: place any objects in the bottom MI , as a bird in a cage, &c.

493. Here the eye, looking through the aperture h , will see each object placed at bottom vastly multiplied, and the images removed at equal distances from one another. Hence, with a large multangular room, in a royal palace, lined with large mirrors, over which were plain pellucid glasses to admit the light, it is evident

that the effects would be very surprising and magnificent.

494. Make two holes in the wainscot of a room, each a foot high and ten inches wide, and about a foot distant from each other. Let these apertures be about the height of a man's head; and in each of them place a transparent glass in a frame, like a common mirror.

495. Behind the partition, and directly facing each aperture, place two mirrors, enclosed in the wainscot, in an angle of 45° . These mirrors are each to be eighteen inches square: and all the space between them must be enclosed with pasteboard painted black, and well closed, that no light may enter: let there be also two curtains to cover them, which may be drawn aside at pleasure. When a person looks into one of these fictitious mirrors, instead of seeing his own face, he will see the object that is in front of the other; thus, if two persons stand at the same time before these mirrors, instead of each seeing himself, they will reciprocally see each other. There should be a scone with a lighted candle, placed on each side of the two glasses in the wainscot, to enlighten the faces of the persons who look in them, or the experiment will not have so remarkable an effect.

496. Place a shilling in a large drinking glass of a conical shape, small at the bottom and wide at the top, and let it be half full of water; then place a plate on the top of it, and turn it quickly over, that the water may not escape. There will be seen on the plate a piece of coin the size of half-a-crown, and a little higher up, another the size of a shilling.

497. The multiplying-glass is a flat plano-

convex lens, a, b, c, d , in the above figure. Rays issuing from the object B, and falling upon the plane surface bc , come to the eye A in the direction ef , which show the object in its true place at B. But rays from the same object also fall upon the flat surfaces ab and cd , and thence coming to the eye in the directions h and k , make the object also to be seen at C and D, so that the object B will be multiplied into as many different objects as the lens has flat surfaces.

498. The following experiment was made by Mr. H. Phillips, to show the different effects of natural and artificial lights on plants. He selected plants of the *mimosa*, *elegans*, *nova*, and *decurrens*, while their pinnated leaves were fully expanded. On placing them in a dark room, the leaves immediately collapsed like the sticks of a fan, or as the feathers of a bird's wing fold over each other. The strongest artificial light that could now be thrown on them had no effect

on the automatic motion of the plants, and the foliage remained in a collapsed state until they were removed into the natural light of day, when their sensitive properties immediately became perceptible, and the whole of the leaflets were seen moving towards their natural and elegant direction, with as much regularity as a regiment of soldiers file off at the word of command.

499. Dr. Brewster's mode of arranging the plane mirrors in the *caleidoscope* is exceedingly perfect. In the ordinary form it is, however, still confined to the gaze of the individual whose eye is placed in contact with the tube; and we now furnish a sketch illustrative of the magic lantern *caleidoscope*, by which it may be exhibited in a large room.

500. The general principle of the apparatus requisite for this subject is shown in fig. 2, where $C D G F$ is the tube containing the reflectors A, O, E , &c. The objects from which the pictures are to be created are placed in the cell $C D$, which may be made either to have a rotatory movement round the axis of the tube, or to slide through a groove, like the sliders of a magic lantern. These objects are powerfully illuminated by a lens B , which concentrates upon them the direct light of the lamp or candle H ; and also the part of the light which is reflected from the mirror $M N$. At the eye end E of the *caleidoscope* is placed a lens $L L$, close to the end of the reflectors, and having its centre coincident with the centre of the aperture at E . In order that this lens may form behind it an image, $P P$, of the objects placed in the object-plate $C D$, its focal length must be less than the length $A E$ of the plates. If the focal length of $L L$ is so small as one half of $A E$, then it follows, from the principles of optics, that the distance $L P$, at which the image is formed behind the lens, will be precisely equal to the distance $A E$ of the object; but this is obviously too small a distance, for the diameter of $P P$ would be equal only to the apparent diameter of the circular aperture of the *caleidoscope*, or to twice $A O$. Hence it is necessary that the focal length of the lens $L L$ be less than $A E$, and greater than half of $A E$. Two-thirds or three-fourths of $A E$ will be found to be a suitable focal strength; for, if it is larger than this, the image will be formed upon the wall at too great a distance from the instrument.

501. When the instrument is thus fitted up, an enlarged image of the pattern will be thrown upon the wall, which must be covered with white paper, or some white ground, in order to exhibit the colors to advantage. By turning the object-plate round its centre, or, if it is a rectilinear one, by pushing it through the groove, and at the same time giving it a rotatory motion, the pattern on the wall will undergo every possible transformation, and exhibit to the spectators, in a magnified form, all those variations which would have been observed by applying the eye to the *caleidoscope*.

502. If a box be formed with a small aperture in one of its sides, and three lights be made to revolve on a piece of wood in the centre, the candle opposite the axis will be visible on a

semi-transparent screen intended to receive its image. The other two candles will also have their flames depicted on the screen, at similar distances, on each side. This experiment serves to show the exceeding minuteness of the rays which emanate from the candles: for, if they were not exceedingly small, they could not pass each other without destroying the perfection of the image.

503. This experiment may be made very amusing by placing a piece of glass, with a ship or any other object painted on it, in the aperture; and, when the candles are parallel to the screen, three images will be seen; but, on making them revolve through a quarter of a circle, only one image will be visible on the screen. By increasing the number of candles the ships will be increased in an equal ratio; and a single ship, by turning the row of candles, will be converted into an entire fleet.

504. If a person be placed directly before a large *concave mirror*, but further from it than its centre of concavity, he will see an inverted image of himself in the air, between him and the mirror, of a less size than his own person. If he hold out his hand towards the mirror, the hand of the image will come out towards his hand, and coincide with it, of an equal bulk when his hand is in the centre of concavity; and he will imagine he may shake hands with his image. If he reach his hand further, the hand of the image will pass by his hand, and come between it and his body; and, if he move his hand towards either side, the hand of the image will move towards the other; so that whatever way the object moves the image will move the contrary way. A bystander will see nothing of the image, because none of the reflected rays that form it enter his eyes.

505. From this remarkable property of a concave mirror to form an image in the air, mirrors of this sort are used to produce a variety of singular appearances, to amuse the curious, or to impose upon the ignorant and superstitious. To a few we shall give a place. If a fire be made in a large room, and a smooth mahogany table be placed at a considerable distance, near the wall, before a large concave mirror, so situated that the light of the fire may be reflected from the mirror to its focus upon the table; if a person stand by the table he will see nothing upon it but a longish beam of light; but, if he stand at a distance towards the fire, not directly between the fire and the mirror, he will see an image of the fire upon the table, large and erect. If another person, who knows nothing of the experiment beforehand, should chance to come into the room, and should look from the fire towards the table, he would be startled at the appearance; for the table would seem to be on fire. In this experiment there should be no light in the room but what proceeds from the fire; and the mirror ought to be at least fifteen inches in diameter.

506. If the fire used in the last experiment be extinguished or covered by a screen, and a large candle be placed in a similar position, a person standing by the candle will see the appearance of a star, or rather planet, upon the table, as brilliant as Venus or Jupiter in a cloudless sky.

If a slender wax-taper be placed near the candle, a satellite to the planet will appear on the table; and, if the taper be moved round the candle, the mimic satellite will go round the planet.

507. If a person looks for some minutes steadily on a window, in the beginning of the evening twilight, or in a dark day, and then moves his eyes a little, so that those parts of the retina on which the dark frame-work of the window was delineated may now fall on the glass part of it, many luminous lines, representing the frame-work, will appear to lie across the glass panes: for those parts of the retina which were before least stimulated by the dark frame-work are now more sensible to light than the other parts of the retina which were exposed to the more luminous parts of the window.

508. Make with ink, on white paper, a very black spot, about half an inch in diameter, with a tail about an inch in length, so as to represent a *tadpole*; look steadily for a minute on this spot, and, on moving the eye a little, the figure of the tadpole will be seen on the white part of the paper, which figure of the tadpole will appear whiter or more luminous than the other parts of the white paper; for the part of the retina on which the tadpole was delineated is now more sensible to light than the other parts of it which were exposed to the white paper. This experiment is mentioned by Dr. Irwin, but is not by him ascribed to the true cause, namely, the great sensibility of that part of the retina which has been exposed to the black spot, than of the other parts which had received the white field of paper.

509. Fig. 3 will serve to illustrate the construction of a very elegant optical toy, or *hydropneumatic temple*.

510. Let us suppose two vessels, the uppermost filled with water, and sustained by two little pillars—one of which is hollow, and furnished with a cock, *e*. Let the other vessel be divided by a partition into two parts; the lower of which may be opened or closed by means of a cock at *e*. Upon the partition place an image, *a*, which the spectator at *f* cannot see by a direct ray, *f, g*. If now the cock, *e*, be opened, the water descending into the cavity, beneath the ray, will be refracted from the perpendicular; so that the spectator will now see the object by the refracted ray. And again shutting the cock *e*, and opening the other *d*, the water will descend into the lower cavity; whence, the refraction ceasing, no rays will now come from the object to the eye; but, shutting the cock *d* again, and opening the other *e*, the water will fill the cavity again, and bring the object in sight afresh.

510.* Provide a sufficient number of small equilateral prisms, a few lines only in breadth, and in length equal to the height of the painting which you intend to make, and place them all close to each other on the ground to be occupied by the painting. Then cut the painting into bands equal to each of the faces of the prism, and cement them, in order, to the faces of the same side. When this is done, take a painting quite different from the former, and, having divided it into bands in the same manner, cement them to the faces of the opposite side. It

pencils of rays materially increases the curvature of the image. In fact no pencil of rays, falling obliquely on a spherical surface, can be collected any where to a perfect focus: the image of a circle would become most distinct at one distance, and that of its diameter at another; but for both these images the surface ought to be much more curved than that which has been usually considered, and the mean of the curvature required for them, which must be the best for the ground or bottom of a camera obscura is equal to that of a sphere of which the radius is three-eighths of the focal distance, when a double convex lens of crown-glass is employed.

516. The general arrangement of this apparatus may be best understood by a reference to the accompanying diagram. Diverging pencils of

rays, as *abc, def, ghi*, issuing from all points of the object *AB*, on the side next the convex lens *EF*, after passing through the lens, will converge to as many points beyond it, and at those points of convergent meeting they will form an inverted picture *CD* of the object on a white paper.

517. Among the various phenomena of vision which were observed by the philosophers of the last century those which arise from *indirect impressions*, and from the influence of highly attenuated light upon the retina, seem to have escaped their notice.

518. If we look at a narrow slip of white paper placed upon a black or a colored ground, it will never appear to vanish, however long and attentively we view it. But if the eye is fixed steadily upon any object within two or three inches of the paper, so as to see it only indirectly, or by oblique division, the slip of paper will occasionally disappear, as if it had been entirely removed from the ground—the color of the retina extending itself over the part of the retina occupied by the image of the slip of paper.

519. If the object seen indirectly is a black stripe on a white ground, it vanishes in a similar manner; and, what is still more remarkable, the same phenomena of disappearance take place, whether the object is viewed with one or with both eyes.

520. When the indirect object is luminous, like a candle, it never vanishes entirely, unless it is placed at a great distance, but it swells and contracts, and is surrounded by a halo of nebulous light, so that the excitement must extend itself to contiguous portions of the retina, which are not influenced by the light itself.

521. If we place two candles at the distance of about eight or ten feet from the eye, and about twelve inches from each other, and view

the one directly, and the other indirectly, the indirect image will be encircled with a bright ring of yellow light, and the bright line within the ring will have a pale blue color. If the candles are viewed through a prism, the red and green lights of the indirect image vanish, and leave only a large mass of yellow, terminated with a portion of blue light.

522. While Dr. Brewster was performing this experiment, and looking steadily and directly at one of the prismatic images of the candle, he was surprised to observe that the red and green rays began to disappear, leaving only yellow and a small portion of blue, and, when the eye was kept immovably fixed on the same part of the image, the yellow light became almost pure white, so that the prismatic image was converted into an elongated image of white light.

523. If the slip of white paper, viewed indirectly with both eyes, is placed so near as to be seen double, the rays which proceed from it no longer fall on corresponding points of the retina. In this case the two images do not vanish simultaneously; but, when the one begins to disappear, the other begins soon after it, so that they sometimes appear to be extinguished at the same time.

524. In order to ascertain whether or not the accidental color of an object seen indirectly would remain after the object itself had disappeared, he placed a rectangular piece of a red wafer upon a white ground, and, having looked steadily at an object in its vicinity, the wafer disappeared, and, though the accidental color showed itself just before the wafer vanished, yet no trace of color was visible afterwards.

525. The insensibility of the retina to indirect impressions, has a singular counterpart in its insensibility to the direct impressions of attenuated light. When the eye is steadily directed to objects illuminated by a feeble gleam of light, it is thrown into a condition nearly as painful as that which arises from an excess of splendor. A sort of remission takes place in the conveyance of the impressions along the nervous membrane; the object naturally disappears, and the eye is agitated by the recurrence of excitements which are too feeble for the performance of its functions. If the eye had, under such a twilight, been making unavailing efforts to read, or to examine a minute object, the pain which it suffers would admit of an easy explanation; but, in the present case, it is the passive recipient of attenuated light, and the uneasiness which it experiences can arise only from the recurring failures in the retina to transmit its impressions to the optic nerve.

526. The preceding facts respecting the affections of the retina, while they throw considerable light on the functions of that membrane, may serve to explain some of those phenomena of the evanescence and reappearance of objects, and of the change of shape of inanimate objects, which have been ascribed by the vulgar to supernatural causes, and by philosophers to the activity of the imagination. If in a dark night, for example, we unexpectedly obtain a glimpse of any object, either in motion or at rest, we are naturally anxious to ascertain what it is, and our curiosity calls forth all our powers of vision. This anxiety,

however, serves only to baffle us in all our attempts. Excited only by a feeble illumination, the retina is not capable of affording a permanent vision of the object, and, while we are straining our eyes to discover its nature, the object will entirely disappear, and will afterwards appear and disappear alternately. The same phenomenon may be observed in day-light by the sportsman, when he endeavours to mark, upon the monotonous heath, the particular spot where moor-game has alighted. Availing himself of the slightest difference of tint in the adjacent heath, he keeps his eye steadily fixed upon it as he advances; but, whenever the contrast of illumination is feeble, he invariably loses sight of his mark, and, if the retina is capable again of taking it up, it is only to lose it again.

527. Mr. Herschel and Mr. South have lately described a curious fact, which has some analogy with the phenomena now described:—

528. ‘Another singular method,’ they remark, ‘of obtaining a view, and even a rough measure of the angles of stars of the last degree of faintness, has often been resorted to, viz. to direct the eye to another part of the field. In this way a faint star, in the neighbourhood of a large one, will often become very conspicuous, so as to bear a certain illumination, which will yet totally disappear, as if suddenly blotted out, when the eye is turned full upon it, and so on, appearing and disappearing alternately, as often as you please. The lateral portions of the retina, less fatigued by strong lights, and less exhausted by perpetual attention, are probably more sensible to faint impressions than the central ones, which may serve to account for this phenomenon.’

529. ‘As it is with much diffidence,’ observes Dr. Brewster, ‘that I venture to controvert any opinion entertained by Mr. Herschel, I have been at some pains to investigate the subject experimentally. I was at first disposed to ascribe the evanescence of the faint star solely to the same cause as the evanescence of faintly illuminated surfaces, and the reappearance of the star by indirect vision to the circumstance of the retina recovering its tone, by contemplating another object sufficiently luminous for vision; but this opinion was not well founded.’

530. ‘If a given quantity of light, which is unable to afford a sustained impression when expanded over a surface, is concentrated into a luminous point, it is still less fitted for the purposes of vision. It then acts upon the retina somewhat in the same way as a sharp point does upon the skin. The luminous point will alternately vanish and reappear; and, if the retina is under the influence of a number of such points, it will be thrown into a state of painful agitation. The same effect is produced by a sharp line of light; the retina is, in this case, thrown into a state of undulation, so as to produce an infinite number of images parallel to the luminous line; and, when this line is a narrow aperture held near the eye, a sheet of paper, to which it is directed, will appear covered with an infinity of broken serpentine lines parallel to the aperture. When the eye is steadfastly fixed for some time upon the parallel lines which are generally used to represent the sea in maps, the lines will all break into

portions of serpentine lines, and red, yellow, green, and blue tints will appear in the interstices of them.

531. ‘The evanescence of stars, therefore, of the last degree of faintness, must be ascribed, both to their deleterious action upon the retina as points of light, and to the insufficiency of their light to maintain a continued impression upon the retina.’

532. When the eye is adjusted to the distinct perception of an object placed in the axis of vision, an object placed out of the axis cannot be seen with the same distinctness, both from the pencils not being accurately converged upon the retina, and from the expansion of the image, which, as we have already described, accompanies indirect vision. A luminous point, therefore, seen indirectly, swells into a disc, and thus loses its sharpness, and acts upon a greater portion of the retina. In order to determine whether this expansion, and the image of the luminous point, was the cause of its superior visibility, I turned my eye full upon a luminous point till it ceased to be visible; and then, re-adjusting my eye so as to swell the point into a circular disc by direct vision, I invariably found that its visibility was instantly increased. If this explanation of the phenomenon be the correct one, the practical astronomer may, with direct vision, obtain a clearer view of minute and faint stars, either by putting the telescope out of its focus, or by adjusting his eye to nearer objects.’—See *Brewster's Journal for September 1825*.

533. The peculiar phenomena that result from vision are too important to be passed unnoticed here. The rays of light being emitted or reflected from a visible object in all directions, it must be plain that some of them from every part of it must reach the eye. Thus the object H K, in the annexed engraving, is visible to an eye in any part where the rays H A, H B, H C, H D, H E, H F, H G, K A, K B, K C, K D, K E, K F, K G, I A, I B, I C, I D, I E, I F, and I G, can come. But, though rays are reflected from every point of the object to every part of the circumambient space, yet it is evident that only those rays which pass through the pupil of the eye can affect the sense; and those rays also give the ideas of color, according to the properties of those bodies which transmit or reflect them.

534. As the direction in which the extremepencils of light cross each other in the eye bears a due proportion to the angle in which they are transmitted from the object to the eye, it is evident that the image formed upon the retina will be proportioned to the apparent magnitude; and thus we have our first ideas of the size and

distance of bodies, which, however, in many cases, are corrected by experience. The nearer any object is to the eye, the larger is the angle by which it will appear in the eye, and therefore the greater will be the seeming magnitude of that body. In fig. 4 let AB be an object viewed directly by the eye QR . From each extremity draw the lines AN and BM , intersecting each other in the crystalline humor at I . Then draw the line IK in the direction in which the eye is supposed to look at the object. The angle AIK is then the optical or visual angle, and the line IK is called the optical axis, because it is the axis of the lens or crystalline humor continued to the object.

535. The apparent magnitude of objects then, depending thus on the angle under which they are seen, will evidently vary according to their distances. Thus different objects, as AB , CD , EF , the real magnitudes of which are very unequal, may be situated at such distances from the eye as to have their apparent magnitudes all equal; for if they are situated at such distances that the rays AN , BM , shall touch the extremities of each, they will then appear all under the same optical angle, and the diameter MN of each image on the retina will consequently be equal.

536. In the same manner objects of equal magnitude, situated at unequal distances, will appear unequal. For let AB and GH , two objects of equal size, be placed before the eye at different distances IK and IS ; draw the lines GP and HO , crossing each other in I ; then OP , the image formed by the objects GH on the retina, is evidently of a greater diameter than the image MN , which represents the object AB ; in other words the object GH will appear as large as an object of the diameter TV situated at the same place as the object AB .

537. To render the subject still clearer, suppose the object HK , fig. 5, to be at 100 yards distance, it will form an angle in the eye at A . At 200 yards distance the angle it makes will be twice as small in the eye at B . Thus, to whatever moderate distance the object is removed, the angle it forms in the eye will be proportionably less, and therefore the object will be diminished in the same proportion.

538. Hence it follows that objects situated at different distances, whose apparent magnitudes are equal, are to each other as their distances from the eye; and, by the same rule, equal objects situated directly before the eye have their apparent magnitudes in a reciprocal proportion to their distances.

539. This last proposition must, however, be received with some allowance; for it is only applicable to very distant objects, and to those where the sense is not corrected by the judgment. For, if the objects are near, we do not judge of their magnitude according to the visual angle. Thus, if a man of six feet high is seen at the distance of six feet under the very same angle as a dwarf of only two feet high, at the distance of two feet, still the dwarf will not appear as large as the man, because the sense is corrected by the judgment. In most cases, however, where the distance is considerable, the rule will be found accurate.

540. If the eye is placed above a horizontal

plain, the different parts of this plain will appear elevated in proportion to their distance, till at length they will appear on a level with it. For, in proportion as the different parts are more distant, the rays which proceed from them to form angles with the optical axis IK , fig. 4, more and more acute, and at length become almost parallel. This is the reason why, if we stand on the sea-shore, those parts of the ocean which are at a great distance appear elevated; for the globular form of the earth is not perceptible to the eye, and, if it was, the apparent elevation of the sea is far greater than the arch which a segment of the globe would form within any distance that our eyes are capable of reaching.

541. For the same reason, if a number of objects are placed on the same plain, and at the same height below the eye, the more distant will appear taller than the others; and if the same objects are placed on a similar plane above the eye, the more distant will appear the lowest.

542. The distant parts of a long wall, for the same reason, appear to a person who stands near one end to curve or incline towards him. In the same manner, the high wall of a lofty tower seems to a spectator placed directly under it to bend over him, and threaten him with instant destruction. If any person who wishes to try the experiment will lie down on his back in a situation of this description, at the distance of five or six feet from the wall of which he contemplates the tremendous height, he will immediately be made sensible of the phenomenon.

543. If the distance between two objects forms an invisible angle, the objects, though in reality at some distance from each other, will appear contiguous. This is assigned by some astronomers as the reason why the ring or belt of Saturn appears as one mass of light, while they contend that it is formed from a number of little stars or satellites ranged within a certain distance of each other.

544. If the eye is carried along as in a boat, without being sensible of its own motion, the objects which are stationary on each side will appear to move in a contrary direction. Thus we attribute to the sun and the other heavenly bodies a diurnal motion, which only affects the earth which we inhabit.

545. If two or three objects at a considerable distance, and on which the eye of the spectator is fixed, move with equal velocity past a third object which is at rest, the moving objects will appear to be actually at rest, and that which is really stationary will appear in motion. Thus the clouds which pass over the face of the moon appear at rest, while the moon itself appears to proceed rapidly along in an opposite direction. This happens because the eye, which is fixed upon the clouds, follows their motion mechanically, and therefore the moon appears to move and not the clouds, as in the boat we do not perceive its motion, but conceive the banks are retiring behind us.

546. If the centre of the pupil, that is, the optic axis, is directed along the surface of any slender object in a perfectly straight line, this line will appear only a point, because, in fact, the extremities only are visible.

547. An extended and distant arch, viewed

by an eye which is exactly in the same line, will appear as a plane surface, because, all the parts appearing equally distant, the curvature will not be perceived.

548. If a circle is viewed obliquely it will appear an oval, because the diameter which is perpendicular to the eye is shortened; in other words, the rays which proceed from the extremities form an angle so much the more acute as the obliquity is greater; on the contrary the diameter which is parallel to the eye is apparently extended.

549. We are indebted to S. L. Kent, Esq., honorary secretary of the London Institution, for the following very important facts, which tend materially to illustrate the real arrangement of the *prismatic spectrum*, as it serves to reduce the number of colors to three; while Dr. Wollaston's latest experiments would indicate the number four, as their ultimate component parts.

550. The prism used in these experiments was five inches long, and the side planes one inch broad; the lens was six inches in diameter, having a focus of two feet three inches; and it was found requisite that the diameter of the lens should exceed the length of the prism in order to insure a good spectrum.

551. Experiment 1.—Mr. Kent threw the colors of the prism on a screen eleven feet distant; and having placed the lens between them, and only two inches from the prism, as in fig. 6, he found the prismatic colors magnified and in the same order, to the dimension of two feet six inches in width, and one foot three inches in depth. In this case the sun's rays were admitted through a Venetian blind; but, when admitted through a hole in a shutter of five inches by four, the dimension was only two feet by nine inches.

552. Experiment 2.—Having placed the lens at the distance of two feet six inches from the prism, as in fig. 7, the figure of the prism was clearly defined, but without exhibiting any prismatic colors whatever on the screen.

553. Experiment 3.—He placed the lens three feet from the prism, as in fig. 8, which produced only the figure of the prism having the violet ray at the bottom and the yellow above.

554. Experiment 4.—When the lens was five feet from the prism, as in fig. 9, the figure of it was distinctly seen with the prismatic colors reversed.

555. Experiment 5.—Mr. Kent placed the lens behind the prism, as in fig. 10, and threw the sun's rays on it at its focal distance, two feet three inches, when the prismatic colors were increased, both in brilliancy and magnitude, considerably more than in the first experiment.

556. Experiment 6.—The lens was put within the focal distance of the screen, as in fig. 11, when a small figure of the prism was seen very bright, but without any prismatic color.

557. Experiment 7.—Having placed the lens as in the second experiment, no prismatic spectrum was produced, but a perfect spectrum of the prism in a strong white light; Mr. Kent then placed another prism in the focus of the lens, as in fig. 12, which produced three colors only, viz. yellow, of a greenish tint, red, and

deep violet. Wishing to ascertain if those three colors were neutral, he tried them with a third prism, and found not the slightest alteration; and, having placed a card so as to receive them, he found, on giving it a whirling motion, that the colors were entirely lost.

558. In the most perfect form of the *phantasmagoria lantern* the sliders are made opaque, except where the figures are introduced, the glass being covered, in the light parts, with a more or less transparent tint, according to the effect required. Several pieces of glass may also be occasionally placed behind each other, and may be made capable of such motions as will nearly imitate the natural motions of the objects which they represent. The figures may also be drawn with water colors on their paper, and afterwards varnished. By removing the lantern to different distances, and altering at the same time more or less the position of the lens, the image may be made to increase or diminish, and to become more or less distinct at pleasure, so that to a person unaccustomed to the effects of optical instruments the figures may appear actually to advance and retire. In reality, however, these figures become much brighter as they are rendered smaller, while in nature the imperfect transparency of the air causes them to appear fainter when they are remote than when they are near: this imperfection might be easily remedied by the interposition of some semi-opaque substance, which might gradually be caused to admit more light as the figure becomes larger, or by uncovering a larger or smaller portion of the lamp, or of its lens. Sometimes, by throwing a strong light upon the actual opaque object, or on a living person, its image is formed on the curtain, retaining its natural motions; but in this case the object must be considerably distant, otherwise the images of its nearer and remoter parts will never be sufficiently distinct at once, the refraction being either too great for the remoter, or too small for the nearer parts: and there must also be a second lens, placed at a sufficient distance from the first to allow an inverted image to be formed between them, and to throw a second picture of this image on the screen in its natural erect position; unless the object be of such a nature that it can be inverted without inconvenience. This effect was very well exhibited at Paris by Robertson; he also combined with his pictures the shadows of living objects, which imitate tolerably well the appearance of such objects in a dark night, or by moon-shine; and, while the room was in complete darkness, concealed screens were probably let down in various parts of it, on which some of the images were projected; for they were sometimes actually situated over the heads of the audience.

559. Dr. Young's suggestions may be thus illustrated:—The light of the lamp A, fig. 13, is thrown by the mirror B and the lenses C and D on the painted slider at E, and the magnifier T forms the image on the screen at G. This lens is fixed to a slider, which may be drawn out of the general support or box H: and, when the box is drawn back on its wheels, the rod I K lowers the point K, and by means of the rod K L adjusts the slider in such a manner that the

image is always distinctly painted on the screen G. When the box advances towards the screen G, in order that the images may be diminished and appear to vanish, the lens F suffers the screen M to fall and intercept a part of the light. The rod KN must be equal to IK, and the point I must be twice the focal length of the lens T, before the object, L being immediately under the focus of the lens. The screen M may have a triangular opening, so as to uncover the middle of the lens only, or the light may be intercepted in any other manner.

560. That the rays of light flow in all directions from different bodies, without interrupting one another, is plain from the following experiments:—Make a little hole in a thin plate of metal, and set the plate upright on a table, facing a row of lighted candles standing near together; then place a sheet of paper or pasteboard at a little distance from the other side of the plate, and the rays of all the candles, flowing through the hole, will form as many specks of light on the paper as there are candles before the plate; each speck as distinct and large as if there were only one candle to cast one speck; which shows that the rays do not obstruct each other in their motions, although they all cross in the same hole.

561. If three pieces of paper are fixed against the wall of a room at equal distances, at the height of the eye, the operator placing himself directly before them at a few yards distance, and the right eye being closed, he will perceive with his left only two of them,—suppose the first and second; let the position of the eye be altered, and the first and third will be seen; if altered a second time, the second and third; but never the whole three together.

562. An *artificial halo* may be formed by placing a candle on one side of a glass receiver, and, the spectator having placed himself at a distance on the other side, let the air be exhausted, and the light of the candle will be refracted in circles of various colors like the halo which encircles the sun.

563. Opticians sometimes grind a glass mirror concave in one direction only, or longitudinally; it is in fact a concave portion of a cylinder, the breadth of which may be considered that of the mirror. A person looking at his face in this mirror, in the direction of its concavity, will see it curiously distorted in a very lengthened appearance; and, by turning the cylindrical mirror a quarter round, his visage will appear distorted in another way, by an apparent increase in width only. If in a very near situation before it you put your finger on the right hand side of the nose, it will appear the same in the mirror; but if in a distant situation, somewhat beyond the centre of concavity, you again look at your face in the mirror, your finger will appear to be removed to the other side.

564. The *thaumatrope*, or wonder-turner, a very ingenious philosophical toy, invented we believe by Dr. Paris, is founded on the well known optical principle that an impression upon the retina continues for about the eighth part of a second after the object which produced it is withdrawn. The luminous rings formed by the whirling of a burning stick in the dark are well

known, and Homer has availed himself of the same principle in his description of the lengthened shadow of the flying javelin.

565. The thaumatrope consists of a number of circular pieces of card, about two inches and a half in diameter, which may be twirled round with great velocity by the application of the fingers to pieces of silk string attached to two opposite points of their circumference. On each side of the card is painted a part of a picture, so that, if we could see both sides at once, the two parts of the picture will form a whole picture. For example, let us suppose a card on one side of which is a cage, and on the other a bird. If we now take hold of each of the silk strings, and put it into a twirling motion, the bird and the cage will appear to the eye at the same moment, in consequence of the impression of each continuing on the retina for a short space of time. The following are some of the other devices on the cards of the thaumatrope:—

A rose-tree, with a garden-pot on the reverse.

A horse, with a man on the reverse.

A leafless branch, which becomes verdant on the twirling of the card.

A female in one dress on one side and another dress on the other.

The body of a Turk, with his head on the reverse.

Harlequin and Columbine on different sides, appear together by the revolution of the card.

A comic head on one side, which, on turning round, becomes invested with a wig.

A man sleeping, and awakened by being turned round.

566. The principle of the thaumatrope may be extended to many other devices. Parts of a sentence may be written on one side, and the rest of the sentence on the other; and we may even put halves of the letters or words on one side and the other halves on the other side. This method of breaking down letters or words or sentences may be varied ad infinitum, and will furnish us with a variety of rotatory cyphers.

567. Those who have used the thaumatrope must have been dissatisfied with the general effect of the two combined pictures. There is a hobbling motion, arising from the imperfection of the method adopted to produce the rotatory motion, which entirely destroys the effect; and it is manifest that the rotatory motion should be produced by quite different means.

568. If strings are adopted they ought to be attached to the circular pieces of card so that the axis of rotation should be in the plane of the card; but a solid axis of rotation is decidedly preferable, and will produce much more pleasing combinations.

569. A curious optical deception may be thus produced. It is to exhibit an erect object which, when placed near a hole in a card, will appear to be on the other side, and also inverted and magnified. Let a card be perforated with a small hole, and placed opposite a white wall or window, the eye of the observer being situated on the other side of the card. A pin being then placed between the eye and card will be seen on the other side of the aperture, inverted and magnified as already described. The reason

of this is, as M. Le Cat has observed, that the eye in this case sees only the shadow of the pin on the retina; and, since the light which is stopped by the upper part of the pin or its head comes from the lower part of the white wall or window, whilst that which is stopped by the lower end of the pin comes from the upper part, the shadow must necessarily appear inverted with respect to the object.

570. Another variation of Le Cat's experiment is as follows:—Take a common pin and hold it in any position near the eye, so that the observer sees reflected from its head a faint circle of

light; then hold a second pin opposite to it, and an inverted image of the one pin will be seen in the head of the other. If the head of the first pin is round and well polished, the inverted and magnified image of the other will be more distinct. In this form of the experiment a diverging pencil of light, from the window or a candle, replaces the diverging pencil which proceeds from the perforation in the card, and of course produces the same effect. The little round knob by the pressure upon which the case of a watch is often opened will answer better than the finest pin head.

T

OPTIMACY, *n. s.* } *Lat. optimates.* Nobility; the body of nobles; one of the divisions of the Roman people: optimity, the state of being best.

In this high court of parliament there is a rare co-ordination of power, a wholesome mixture betwixt monarchy, *optimacy*, and democracy. *Howel.*

OPTIMATES, in ancient history, a political party among the Roman people, opposed to the populares. They were warm supporters of the dignity of the chief magistrates and promoters of the senatorial power; whereas the populares boldly stood up for the rights of the people, pleaded for larger privileges, and labored to bring matters nearer to a level. Cicero says, that the optimates were the best citizens, who wished to deserve the approbation of the better sort; and that the populares courted the favor of the populace, not so much considering what was right, as what would please the people, and gratify their own thirst of vain glory and empty applause.

OPTIO, an officer in the Roman army, an assistant or lieutenant to every centurion; so called because he was the choice or option of the centurion in later times: at first, however, he had been chosen by the tribune, or chief commander of the legion. These optiones are also sometimes called succenturiones and tergiductories; the last name was given them because their post was in the rear of the company. Some authors mention suboptiones, or sublieutenants.

OPTION, *n. s.* *Lat. optio.* Choice; election.

Transplantation must proceed from the *option* of the people, else it sounds like an exile; so the colonies must be raised by the leave of the king, and not by his command. *Bacon.*

He decrees to punish the contumacy finally, by assigning them their own *options*. *Hammond.*

Which of these two rewards we will receive, he hath left to our *option*. *Smalbridge.*

OPTION, in ecclesiastical polity. When a new suffragan bishop is consecrated, the archbishop of the province, by a customary prerogative, claims the collation of the first vacant benefice, or dignity, in that see, according as he shall choose; which choice is called the archbishop's option. But if the bishop dies, or is translated, before the incumbent of the promotion chosen by the archbishop die or be removed, it is generally supposed that the option is void; as the granter, singly and by himself, could not convey any right or title beyond the term of his continuance in that see. And, if the archbishop dies before the voidance happen, the right of filling up the vacancy shall go to his executors or administrators.

OPULENCE, *n. s.* } *Fr. opulence; Ital. Op'ulency, } opulenza; Port. Span. Op'ulent, adj. } and Lat. opulentia. Affluence; riches; splendid style of living: opulent is, wealthy; rich; affluent.*

It must be a discovery of the infinite flatteries that follow youth and *opulency*. *Shakespeare. Timon.*

He made him his ally, and provoked a mighty and *opulent* king by an offensive war in his quarrel. *Bacon.*

After eight years spent in outward *opulency* and inward murmur, that it was not greater; after vast sums of money and great wealth gotten, he died unlamented. *Clarendon.*

To begin with the supposed policy of gratifying only the rich and *opulent*:—does our wise man think that the grandee whom he courts does not see through all the little plots of his courtship? *South.*

He had been a person not only of great *opulency*, but authority. *Atterbury.*

There in full *opulence* a banker dwelt,
Who all the joys and pangs of riches felt;
His side-board glittered with imagined plate,
And his proud fancy held a vast estate. *Swift.*
How few can rescue *opulences* from want! *Young.*

OPUNTIA, the prickly pear tree, a species of cactus; see **CACTUS**. The fruit of the opuntia is remarkable for coloring the juices of living animals, though it appears not to be poisonous or even hurtful to the body. The prickly pear grows in great abundance about Carolina; and, cochineal insects are found upon it, though no attempt has yet been made to cure them for use as the Spaniards do.

OR, *conj.* *Sax. oðen; Goth. odr; Teut. oder.* Other; either (of both which it is used as a contraction); before a disjunctive particle denoting choice, distribution, and sometimes opposition.

Learn before thou speak, and use physick *or* *ever* thou be sick. *Eccles. xviii. 19.*

The dead man's knell
Is there scarce asked, for whom; and good men's lives

Expire before the flowers in their caps,
Dying *or* ere they sicken. *Shakespeare. Macbeth.*

How great soever the sins of any unreformed person are, Christ died for him because he died for all; only he must reform and forsake his sins, or else he shall never receive benefit of his death. *Hammond.*

For thy vast bounties are so numberless,
That them *or* to conceal, or else to tell,
Is equally impossible. *Conway.*

Or we go to the declaration of this psalm, it shall be convenient to shew who did write this psalm. *Fisher.*

Inquire what the ancients thought concerning this world, whether it was to perish *or* no? whether to be destroyed *or* to stand eternally? *Barnet.*

He my muse's homage should receive,
If I could write, *or* Holles could forgive. *Garth.*

At Venice you may go to any house either by land *or* water. *Addison.*

By intense study, *or* application to business that requires little action, the digestion of foods will soon proceed more slowly, and with more uneasiness. *Blackmore.*

Every thing that can be divided by the mind into two *or* more ideas is called complex. *Watts.*

The restless fry
Run bustling to and fro with foolish haste
In search of pleasures vain that from them fly,
Or which obtained the catiffs dare not taste;
When nothing is enjoyed, can there be greater waste? *Thomson.*

Speak thou, whose thoughts at humble peace
repine,
Shall Wolsey's wealth with Wolsey's end be thine?
Or livest thou now with safer pride content,
The wisest justice on the banks of Trent? *Johnson.*
But the sound of the church-going bell
These valleys and rocks never heard,

Never sighed at the sound of a knell,
Or smiled when a sabbath appeared.

Cowper.

A fourth as marble, statue-like and still,
Lay in a breathless, hushed, and stony sleep;
While, cold and pure, as looks a frozen rill,
Or the snow minaret on Alpine steep,
Or Lot's wife done in salt,—or what you will.

Byron.

Was it the squire, for killing of his game? or
Covetous parson, for his tithes distraining?
Or roguish lawyer, made you lose your little
All in a lawsuit?

Canning.

OR, *n. s.* Fr. *or.* Gold; an heraldic term.
The showery arch
With listed colours gay, *or*, azure, gules,
Delights and puzzles the beholders' eyes.

Philips.

OR, the French word for gold, by which this metal is expressed in heraldry. In engraving it is denoted by small points all over the field or bearing. See HERALDRY.

ORA, in antiquity, was a term equivalent to an ounce; but it has been much debated among antiquaries, whether the ora was a coin, or only money of account. Dr. Hickee says, that the mode of reckoning money by marks and oras was never known in England till after the Danish invasions; and from the old nummular estimates, among the principal Gothic states upon the Baltic, it appears that the ora and solidus were synonymous terms, and that the ora was the eighteenth part of the mark. From several Danish laws, it likewise appears that the Danish ora, derived by corruption from aureus, was the same as the Frank solidus of 12*d.* As a weight the ora was regarded as the uncia or unit, by which the Danish mark was divided; and in Doomsday book the ora is used for the ounce, or the twelfth part of the nummular Saxon pound, and the fifteenth of the commercial: as a coin, it was an aureus, or the Frank solidus of 12*d.* There was another ora mentioned in the rolls of the twenty-seventh of Henry III. the value of which was sixteen pence; and this was probably derived from the half mancus of the Saxons. Such, in all appearance, was the original of these two oras; as there were no aurei of that period to which these two denominations of money of sixteen and twelve pence can possibly be ascribed. The name ora distinguishes the gold coins in several parts of Europe to this day. The Portuguese *moidore* is nothing else but *moeda d'oro*, from the Latin *moneta de auro*; the French *Louis d'ores* come from the same use of the word, and owe their appellation to the ora. See *Clarke on Coins*.

ORACH. See ATRIPLEX.

ORACLE, *n. s. & v. n.* } Fr. *oracle*; Belg.
ORACULAR, *adj.* } and Teut. *orakel*;
ORACULOUS, } Ital. Span. and Port.
ORACULOUSLY, *adv.* } *oraculo*; Lat. *ora-*
ORACULOUSNESS, *n. s.* } *culum* (ab *oro*, to

speak). Something delivered by superior or supernatural wisdom; the place where, or person by whom, such communications are delivered: to utter oracles: oracular and oraculous, mean uttering or resembling oracles; the adverb and noun substantive corresponding.

The main principle whereupon our belief of all things therein contained dependeth, is, that the Scriptures are the *oracles* of God himself. *Hooker.*

Why, by the verities on thee made good,
May they not be my *oracles* as well,
And set me up in hope? *Shakspeare. Macbeth.*
God hath now sent his living *oracle*
Into the world to teach his final will,
And sends his spirit of truth henceforth to dwell,
In pious hearts an inward *oracle*,
To all truth requisite for men to know. *Milton.*

No more shalt thou by *oraceling* abuse
The gentiles. *Id.*

Thy counsel would be as the *oracle* of
Urim and thummim, those *oraculous* gems
On Aaron's breast, or tongue of seers old
Infallible. *Id. Paradise Regained.*

The testimonies of antiquity, and such as pass *oraculously* amongst us, were not always so exact as to examine the doctrine they delivered.

Brown's Vulgar Errors.

Though their general acknowledgments of the weakness of human understanding look like cold and sceptical discouragements; yet the particular expressions of their sentiments are as *oraculous* as if they were omniscient. *Glennville's Scopsis.*

Here Charles contrives the ordering of his states,
Here he resolves his neighb'ring princes' fates;
What nation shall have peace, where war be made,
Determined is in this *oraculous* shade. *Waller.*

Hence rise the branching beech and vocal oak,
Where Jove of old *oraculously* spoke. *Dryden.*

He spoke *oraculous* and sly,
He'd neither grant the question, nor deny. *King.*

There mighty nations shall enquire their doom,
The world's great *oracle* in times to come. *Pope.*
They have something venerable and *oracular*, in
that unadorned gravity and shortness in the expression. *Id.*

The' *oraculous* seer frequents the Pharian coast,
Proteus a name tremendous o'er the main. *Id.*

A graver coxcomb we may sometimes see,
Quite as absurd, though not so light as he:
A shallow brain behind a serious mask,
An *oracle* within an empty cask. *Cowper.*

ORACLE, in sacred history, is sometimes used for the mercy-seat, or the cover of the ark of the covenant; and by others it is taken for the sanctuary, or for the most holy place, wherein the ark was deposited. Among the Jews we may distinguish several sorts of oracles. They had first oracles that were delivered *viva voce*; as when God spake to Moses face to face, as one friend speaks to another. (Numb. xii. 8.) 2. Prophetic dreams sent by God: as the dreams which God sent to Joseph, and which foretold his future greatness (Gen. xxxvii. 5, 6). 3. Visions; as when a prophet in an ecstasy, being neither properly asleep nor awake, had supernatural revelations. (Gen. xv. 1; xvi. 2) 4. The oracle of Urim and Thummim, which was accompanied with the ephod or the pectoral worn by the high-priest, and which God had endued with the gift of foretelling things to come (Numb. xii. 6. Joel ii. 28.) This manner of enquiring of the Lord was often made use of, from Joshua's time to the erection of the temple at Jerusalem. Fifthly, After the building of the temple, they generally consulted the prophets, who were frequent in Judah and Israel. From Haggai, Zechariah, and Malachi, who are the last

of the prophets that have any of their writings remaining, the Jews assert that God gave them what they call Bathkol, the daughter of the voice, which was a supernatural manifestation of the will of God, performed either by a strong inspiration or internal voice, or else by a sensible and external voice, which was heard by a number of persons sufficient to bear testimony of it. For example, such was the voice that was heard at the baptism of Jesus Christ. (Matth. iii. 17.)

ORACLE, among the heathens, was the answer, which the gods were supposed to give to those who consulted them upon any affair of importance. The credit of oracles was so great that in all doubts and disputes their determinations were held sacred and inviolable: whence vast numbers flocked to them for advice; and no business of importance was undertaken, scarcely any peace concluded, any war waged, or any new form of government instituted, without the advice and approbation of some oracle. The answers were given by the priest or priestess of the god who was consulted; and generally expressed in such dark and ambiguous phrases as might be easily wrested to prove the truth of the oracle whatever was the event. It is not, therefore, to be wondered at, that the priests who delivered them were in the highest credit and esteem, and that they managed this reputation so as greatly to promote their own advantage. They accordingly allowed no man to consult the gods before he had offered costly sacrifices, and made rich presents to them. And to keep up the veneration for their oracles, and to prevent their being taken unprepared, they admitted persons to consult the gods only at certain stated times; and sometimes they were so cautious that the greatest personages could obtain no answer at all.

The most ancient oracle was that of Dodona (see DODONA); but the most famous was that of DELPHI, to which article we also refer for further particulars on this subject, so famous in Pagan antiquity. Another celebrated one was the oracle of Trophonius, in the neighbourhood of Lebadia, a city of Boeotia, which was held in high estimation. It received its name from Trophonius, brother of Agamedes, who lived in a subterraneous dwelling near Lebadia, and pretended to the faculty of foretelling future events. He died in his cave, and was deified as an oracular god. This oracle owed its reputation to one Saon. Those who repaired to this cave for information were required to offer certain sacrifices, to anoint themselves with oil, and to bathe in a certain river: they were then clothed in a linen robe, took a honeyed cake in their hands, and descended into the subterraneous chamber by a narrow passage. Here it was that futurity was unfolded to them, either by visions or extraordinary sounds. The return from the cave was by the same passage, but the persons consulting were obliged to walk backwards. They generally came out astonished, melancholy, and dejected; hence the proverb, *Εἰς Τροφονίον μεμνῆσθαι*. The priests on their return placed them on an elevated seat, called the seat of Mnemosyne, where an account was taken of what they had seen and heard. They were then conducted to the chapel of good Genius by their companions,

where, by degrees, they recovered their usual composure and cheerfulness. Besides these three principal oracles of Greece, that of Amphiaras, at Oropus in Attica, was famous. It was so called from Amphiaras, the son of Oicleus, a man skilled in magic, the interpretation of dreams, &c., and who after his death was deified and delivered oracles in a temple erected to his divinity. They who applied to him for information were to purify themselves, offer sacrifice, fast twenty-four hours, abstain from wine two days, and make an offering of a ram to Amphiaras; on the skin of which they were to sleep, and see their destiny in a dream. Near the temple was Amphiaras's fountain, which was sacred, and the waters of it forbidden to be used for ordinary purposes. At Delos also there was an oracle of the Delian Apollo; in Milesia was that of the Branchidae; with others of less note, such as that of the camps at Lacedæmon, that of Nabarcha, and those of Chrysopolis, Claros in Ionia, Mallos, Patarea, Pella, Phaselides, Sinope, Orpheus's head, &c. Though the Romans consulted the Grecian oracles upon many occasions, and had few oracles in their own country, yet we must not omit mentioning the Cumæan oracles, which were delivered by the Sibyl of Cumæ. For an account of the Sibyls, see the article SIBYL. See also DÆMON and DÆMONIAC. Of the oracles of false gods there was a far greater number than our limits permit us to enumerate.

It has been generally held by the early writers in the Christian church, that oracles ceased at the birth of Jesus Christ: yet some have endeavoured to maintain the contrary, by showing that they were in being in the days of Julian, commonly called the Apostate, and that this emperor himself consulted them; nay, farther, say they, history makes mention of several laws published by the Christian emperors, Theodosius, Gratian, and Valentinian, to punish persons who interrogated them, even in their days; and that the Epicureans were the first who made a jest of this superstition, and exposed the roguery of its priests to the people. As we suspect most of the facts here asserted should be understood in a qualified sense, we shall discuss this point in as few words as possible, although it is undoubtedly a matter of some consequence. 1st, The question, properly stated, is not, whether oracles became extinct immediately on the birth of Christ, or from the very moment he was born? but, if they fell gradually into disesteem, and ceased, as Christ and his gospel became known to mankind? And that they did so is most certain, from the concurrent testimonies of the fathers, which, whoever would endeavour to invalidate, may equally give up the most respectable traditions and history of every kind. 2dly, But did not Julian the Apostate consult these oracles? We answer in the negative: he had indeed recourse to magical operations, but it was because oracles had already ceased; for he bewailed the loss of them, and assigned pitiful reasons for it; which St. Cyrill refuted, adding, that he never could have offered such, but from unwillingness to acknowledge that when the world had received the light of Christ, the dominion of the devil was at

an end. 3rdly, The Christian emperors do indeed seem to condemn the superstition and idolatry of those who were still for consulting oracles; but the edicts of those princes do not prove that oracles actually existed in their times, any more than that they ceased in consequence of their laws. It is certain that they were for the most part extinct before the conversion of Constantine. 4thly, Some Epicureans might make a jest of this superstition; however the Epicurean philosopher Celsus, in the second century, was for crying up the excellency of several oracles, as appears from Origen's seventh book against him.

ORÆA, certain solemn sacrifices of fruits which were offered in the four seasons of the year, in order to obtain mild and temperate weather. They were offered to the goddesses who presided over the seasons, who attended upon the sun, and who received divine worship at Athens.

ORAIISON, or } Fr. *oraison*; Lat. *oratio*,
OR'ISON, n. s. } Prayer; oral worship; adoration or supplication.

His daily *orisons* attract our ears.

Sandys on Job.

Nymph, in thy *orisons*

Be all my sins remembered.

Shakespeare. Hamlet.

My wakeful lay shall knock

At the' oriental gates, and duly mock

The early lark's shrill *orisons*, to be

An anthem at the day's nativity. *Crashaw.*

He went into St. Paul's church, where he had *orisons* and Te Deum sung. *Bacon's Henry VII.*

I have grieved to see poor misguided souls under the papacy measuring their *orisons* not by weight, but by number. *Hall.*

Lowly they bowed, adoring and began

Their *orisons* each morning duly paid. *Milton.*

So went he on with his *orisons*,

Which, if you mark them well, were wise ones. *Cotton.*

Business might shorten, not disturb her prayer;

Heaven had the best, if not the greater share:

An active life, long *oraisons* forbids,

Yet still she prayed, for still she prayed by deeds. *Dryden.*

Here at dead of night

The hermit oft, mid his *orisons*, hears

Aghast the voice of time-disparting towers. *Dyer.*

The midnight clock attests my fervent prayers,

The rising sun my *orisons* declares. *Harte.*

Most glorious orb! that wert a worship, ere

The mystery of thy making was revealed!

Thou earliest minister of the Almighty,

Which gladdened, on their mountain tops, the heart

Of the Chaldean shepherds, till they poured

Themselves in *orisons*! *Byron.*

O'RAL, *adj.* } Fr. *oral*; Lat. *os*, *oris*, the

O'RALLY, *adv.* } mouth. Delivered by the mouth or in speech: orally, by the mouth, without writing.

Oral tradition were incompetent without written monuments to derive to us the original laws of a kingdom, because they are complex, not orally traducible to so great a distance of ages. *Hale.*

Oral discourse, whose transient faults dying with the sound that gives them life, and so not subject to a strict review, more easily escapes observation.

Locke on Education.

St. John was appealed to as the living oracle of the church; and, as his *oral* testimony lasted the first century, many have observed, that by a particular providence several of our Saviour's disciples, and of the early converts, lived to a very great age, that they might personally convey the truth of the gospel to those times which were very remote. *Addison.*

ORAMALA, a town of the Sardinian states, in the Milanese province of Bobbio. It is situated on the declivity of a hill, at the foot of which flows the Staffora. Inhabitants 3100.

ORAN, or Warran, a considerable town in the province of Tlemsan or Tremecen, Algiers. The Spaniards commanded by cardinal Ximenes, took it in 1509, and retained possession of it till the period of the succession war, when, in 1708, the Algerines, perceiving it neglected, found means to obtain possession. The Spaniards, however, regained it in 1732, and retained it till a recent period, when they restored the town, retaining the castle of Mers al Kebeer. This place is built on the declivity and foot of a high mountain, which overlooks it from the north, and on the summit are built two fine, strong castles, one of which is that retained by the Spaniards. Dr. Shaw did not find here any Roman antiquities; but several beautiful churches have been built by the Spaniards. 170 miles south-west of Algiers. Long 0° 18' W., lat. 35° 50' N.

OR'ANGE, n. s. } Fr. *orange*; Lat. *auran-*

OR'ANGERY, } *tium* (ab *aureo colore*.—

OR'ANGEMUSK, } Ainsworth). A fruit or

OR'ANGETAWNEY, } fruit-tree; a species of *Ci-*

OR'ANGEWIFE. } *trus*, which see: an oran-

gery is, a place where oranges are raised: orange-musk, a species of pear: orange-tawney, a color resembling that of the orange: orange-wife (orange, and Sax. *pip*, Gothr *huif*, a woman's hood), a woman who sells oranges.

I will discharge it in your straw-coloured beard, your orange tawny beard. *Shakespeare.*

You wear out a good wholesome forenoon in hearing a cause between an *orangewife* and a fasset teller. *Id.*

The notary came aboard, holding in his hand a fruit like an *orange*, but of colour between *orange tawny* and scarlet, which cast a most excellent odour, and is used for a preservative against infection. *Bacon's New Atlantis.*

The ideas of *orange* colour and azure, produced in the mind by the same infusion of *lignum nephriticum*, are no less distinct ideas than those of the same colours taken from two different bodies. *Locke.*

A kitchen garden is a more pleasant sight than the finest *orangery*, or artificial green-house. *Spectator.*

Fine *oranges*, sauce for your veal, Are charming when squeezed in a pot of brown ale. *Swift.*

Baronets, or knights of Nova Scotia, are commonly distinguished from others by a ribbon of *orangetawney*. *Heylin.*

The punic granate oped its rose-like flowers; The *orange* breathed its aromatic powers. *Harte.*

ORANGE, in botany. See CITRUS.

ORANGE, *coloniz secundanorum*, an ancient post town of the department of Vaucluse, France; the chief place of a subprefecture containing 8000 inhabitants, and having an inferior court

of judicature, an agricultural society, and a communal college. It is situated in a magnificent plain, which is watered by the Aiques and a multitude of smaller streams. It is in general but badly built; the streets are narrow and close, but ornamented with handsome public fountains, the waters of which are excellent. Ptolemy calls it Aurosis Cavarum, as it was one of the four towns belonging to the Cavares. The Romans had possession of it for several centuries, and it is celebrated for the monuments of their power which are yet remaining. The Burgundians and Visigoths were the first that wrested it from the Romans; they were driven out by the kings of France of the first Race. During the wars, that were terminated by the treaties of Nimeguen and Ryswick, Louis XIV. seized upon Orange, and demolished its citadel. Formerly it was the capital of a principality of the same name, which was extinct before the revolution.

The manufactures of this town consist of handkerchiefs, printed calicoes, and serges. There are also silk mills and mills for grinding madder. The inhabitants carry on a trade in wine, brandy, truffles, saffron, honey, yellow wax, wool, madder, grain of all kinds, perfumery, gums, &c. About 400 yards from the town, on the road from Lyons to Marseilles, is a triumphal arch, almost entire, which was erected in memory of the victory of Marius and Catulus over the Cimbri. It is sixty-six feet broad and sixty feet high, pierced with three arcades, of which the centre is the largest, being designed for carriages. Fluted Corinthian columns rise on each side of the arcades, the middle ones supporting a triangular pediment, above which is an attic crowned with a beautiful cornice. There is not even in Rome itself a triumphal arch so magnificent as this. On a mountain in the neighbourhood there is still to be seen a theatre of Roman construction, in very good preservation, built in a semi-circle, and bounded by a wall still entire. It is 108 feet high and 300 feet broad, built of fine square stones, and decorated with two rows of arcades and an attic.

Orange is twenty-one miles north of Avignon; eighteen west of Charpentras; twelve south-west of Pont St. Esprit, and 483 south-east of Paris.

ORANGE, SEA, in natural history, a name given by count Marsigli to a very remarkable species of marine substance, which he denominates a plant. It is tough and firm in its structure, and in many things resembles the common fucus; but, instead of growing into the branched form which the generality of those substances have, it is round and hollow, and in every respect resembles the shape of an orange. It has, by way of root, certain very fine filaments, which fasten themselves to the rocks, or to shells, stones, or any thing else that comes in the way. From these there grows no pedicle; but the body of the orange, as it is called, is fastened by them to the rock, or other solid substance. The orange itself is usually of about three or four inches in diameter; and, while in the sea, is full of water, and even retains it when taken up. In this state it frequently weighs a pound and a half; but, when the water is let out, and it is dried, it be-

comes a mere membrane, weighing scarcely any thing. It is best preserved by stuffing it with cotton as soon as the water is let out of it, and then hanging it up to dry. Its surface is irregular and rough, and its color a dusky green on the outside, and a clearer, but somewhat bluish, green within; and its thickness is about an eighth part of an inch. When viewed by the microscope, it is seen to be all over covered with small glandules, or rather composed of them; for they stand so thick one by another as to leave no space between, and seem to make up the whole substance; so that it appears very like the rough shagreen skin used to cover toys. These are indeed so many hollow ducts, through which the sea-water finds a passage into the globe formed by this skin, and by these means it is kept always full and distended; on cutting it with a pair of scissors the water immediately runs out, and the skins collapse; but there is something extremely remarkable in this; for the whole substance, near the wounded place, is in motion, and seems as if alive, and sensible of the wound. The glandules are found full of water, and resembling small transparent bottles.

ORANGE-DEW, a kind of dew which falls in the spring-time from the leaves of orange and lemon trees, which is extremely subtle. M. De la Hire observing this, placed some flat pieces of glass under the leaves to receive it; and, having procured some large drops of it, was desirous of discovering what it was. He soon found that it was not a merely aqueous fluid, because it did not evaporate in the air; and that it was not a resin, because it readily and perfectly mixed with water: it was natural then to suppose it a liquid gum; but neither did this, on examination, prove to be the case; for, being laid on paper, it did not dry as the other liquid gums do. Whence he concluded that it was a kind of manna, which more detailed experiment proved to be the case.

ORANGE RIVER, a river of Southern Africa, in the Graaf Reynet, district of the Cape colony. It first flows north-west, but afterwards almost due west, till it falls into the Atlantic. In the east part of its course it forms the limit between the country of the Hottentots and Boshuanas; and on the south the banks present an entirely different character of animal and vegetable life from those on the north. Westward it passes a desert, in which waggon wheels sink, and can with the utmost difficulty be dragged along. The sand-stone rocks here rise in perpendicular walls to a vast extent. The heat is here very severe and scorching. After a course of about 600 miles, it falls into the Atlantic, lat. 28° 30' S.

ORANGE-TREE, in botany. See CITRUS.

ORANGE-FLOWERS are justly esteemed one of the finest perfumes; and, though little used in medicine, yet the water distilled from them is accounted stomachic, cordial, and carminative. The fruit is cooling, and good in feverish disorders, and particularly in diarrhœas. Orange-peel is an agreeable aromatic, proper to repair and strengthen the stomach, and gives a very grateful flavor to any infusions or tinctures into whose compositions it enters. It is particularly

useful in preparations of the bark; gives an agreeable warmth to the infusion; and, according to Dr. Percival, considerably increases its virtue. In the Philosophical Transactions there is a very remarkable account of a tree standing in a grove near Florence, having an orange stock, which had been so grafted upon, that it became, in its branches, leaves, flower, and fruit, three-formed: some emulating the orange, some the lemon or citron, and some partaking of both forms in one; and what was very remarkable, was, that these mixed fruits never produced any perfect seeds; sometimes there were no seeds at all in them, and sometimes only a few empty ones.

ORANG-OUTANG. See SIMIA.

ORATION, *n. s.*

ORATOR,

ORATOR'ICAL, *adj.*

ORATOR'ICALLY, *adv.*

ORATORY, *n. s.*

Fr. *oration*; Ital. *orazione*; Span. *oracion*; Lat. *oratio*. A formal speech; a regular or systematic harangue.

an orator is, he who delivers such an harangue: oratorical, relating to, or besitting, oratory or rhetoric; rhetorical: oratory, eloquence; rhetoric; exercise of eloquence; also (Fr. *oratoire*) a place devoted to prayer.

And for to don his rite and sacrifice
He eastward bath upon the gate above,
In worship of Venus, goddess of love,
Don make an auter and an *oratorie*.

Chaucer.

They began to erect to themselves *oratories* not in any sumptuous or stately manner, which neither was possible by reason of the poor estate of the church, and had been perilous in regard of the world's envy towards them.

Hooher.

Poor queen and son! your labour is but lost;
For Warwick is a subtle *orator*.

Shakspeare.

There shall I try,
In my *oration*, how the people take
The cruel issue of these bloody men. *Id.*

When a world of men
Could not prevail with all their *oratory*,
Yet hath a woman's kindness over-ruled. *Id.*

Each pasture stored with sheep feeding with sober security, while the pretty lambs, with bleating *oratory*, craved the dam's comfort.

Sidney.

In *oratory* affectation must be avoided as a pestilence.

Lord Herbert.

Do not omit thy prayers for want of a good *oratory* or place to pray in; nor thy duty for want of temporal encouragements.

Taylor.

By this kind of *oratory*, and professing to decline their own inclinations and wishes, purely for peace and unity, they prevailed over those who were still surprised.

Clarendon.

As when of old some *orator* renowned,
In Athens or free Rome, where eloquence
Flourished, since mute! to some great cause addressed,

Stood in himself collected; while each part,
Motion, each act, won audience. *Milton.*

Sighs now breathed

Unutterable, which the spirit of prayer
Inspired, and winged for heaven with speedier flight
Than loudest *oratory*. *Id. Paradise Lost.*

It would be altogether vain and improper in matters belonging to an *orator* to pretend to strict demonstration.

Wilkins.

Hammond's subjects were such as had greatest influence on practice, which he prest with most affectionate tenderness, making tears part of his *oratory*.

Fell.

Both *orators* so much renowned,
In their own depths of eloquence were drowned.

Dryden.

Oratory signifies a private place, which is deputed and allotted for prayer alone, and not for the general celebration of divine service.

Ayliffe's Parergon.

Come, harmless characters, that no one hit,
Come, Henley's *oratory*, Osborn's wit. *Pope.*

I have listened to an *orator* of this species, without being able to understand one single sentence.

Swift.

The former, who had to deal with a people of much more politeness, learning, and wit, laid the greatest weight of his *oratory* upon the strength of his arguments.

Id.

This gives life and spirit to every thing that is spoken, awakens the dullest spirits, and adds a singular grace and excellency both to the person and his *oration*.

Watts.

Where he speaks in an *oratorical*, affecting, or persuasive way, let this be explained by other places where he treats of the same theme in a doctrinal way.

Id.

It is said that a man must be born a poet, but it is in his power to make himself an *orator*; for, to be a poet requires a certain degree of strength and vivacity of mind; but that attention, reading, and labour, are sufficient to form an *orator*.

Chesterfield.

The business of *oratory* is to persuade, and to please is the most effectual step towards persuading.

Id.

In *oratory* the greatest art is to hide art. *Ars est celare artem.*

Sheridan.

ORATOR, among the ancient Romans, differed from a patronus: the latter was allowed only to plead causes on behalf of his clients; whereas the former might quit the forum and ascend the rostra or tribunal, to harangue the senate or the people. The orators had rarely a profound knowledge of the law, but they were eloquent, and their style was generally correct and concise. They were employed in causes of importance, instead of the common patrons. Similar to the Roman orators were the Grecian Rhetores. See RHETORES.

ORATOR, PUBLIC, an officer of very considerable dignity, and of some emolument, in the English universities. The public orator is the principal, and in many cases the only ostensible, agent for the university in all those matters or forms which are merely external. He carries on or superintends all correspondences which are calculated to promote the dignity, or raise the utility, of the seminary. He has little to do, indeed, with the internal government of the body, for which a variety of officers in different departments are appointed; but in all public affairs he is, as it were, the mouth of the whole; putting their deliberations into proper form, and communicating or publishing them, according to the intention of the university. Thus, if the whole university, or a committee appointed by them, by statute, or by the will of any particular benefactor, have, after a comparative trial, adjudged a prize to any person or persons, it is the business of the public orator to inform the successful parties of the issue of the trial. Again, if for singular learning, or for any remarkable good will shown to the university by any person or persons, the senate or convocation are pleased to declare their grateful sense of it, either by

conferring degrees, or otherwise, as they think fit, the public orator is to notify this intention to the person or persons concerned; and so in other cases.

Another part of the public orator's business is to present young noblemen, or those who take honorary degrees, *tanquam nobiles*, to the vice-chancellor: this he does in a Latin oration, of which the subject is generally a defence of that particular statute which allows the sons of noblemen, and some few others, to proceed to degrees before what is called the statutable time. In doing this, encomiums are made upon the learning and virtue of the noble candidate; a view is taken of the dignity of his ancient house; the honor is mentioned which has accrued to the university from the accession of such a member; and the oration concludes with promising great credit from his future conduct, as well as benefit from the influence of his rank in the state. These circumstances are deemed sufficient grounds for exempting the sons of noblemen from that tedious course of study through which the sons of commoners must all pass before they be thought worthy of academical honors.

ORATORIO, in the Italian music, a sort of sacred drama of dialogues; containing recitativos, duettos, trios, ritornellos, choruses, &c. The subjects of those pieces are usually taken from Scripture. Oratorios are greatly used in Rome in the time of Lent, and are now common in England. Menestrier attributes the origin of oratorios to the crusades, and says that the pilgrims returning from Jerusalem and the Holy Land, &c., composed songs, reciting the life and death of the Son of God, and the mysteries of the Christian faith, and celebrating the achievements and constancy of saints and martyrs. Others, with more probability, observe that the oratorio was an avowed imitation of the opera, with only this difference, that the foundation of it was always some religious or moral subject. Crescimbeni ascribes its origin to St. Philip Neri, who, in his chapel, after sermons, in order to allure young people to pious offices, had hymns and psalms sung by one or more voices. Among these spiritual songs were dialogues; and these entertainments, improving every year, gave rise in the seventeenth century to oratorios, so called from the place of their origin.

O R A T O R Y.

ORATORY has been defined the art of speaking well upon any subject, in order to persuade. The terms rhetoric and oratory, having no other difference but that one is taken from the Greek language, and the other from the Latin, may be used synonymously; but the case is not the same with respect to the words rhetorician and orator. For, although the Grecians used the former, both to express those who taught the art, and those who practised it, yet the Romans afterward, when they took that word into their language, confined it to the teachers of the art, and called the rest orators. And there seems to have been a sufficient reason for this distinction, since the art was the same in both, and might therefore go by either name: but the different province of rhetoricians and orators made it not proper that they should be called by different names. Besides, anciently, before rhetoric was made a separate and distinct art from philosophy, the same persons taught both. And then they were called not only rhetoricians but sophists. But, because they often employed their art rather to vindicate what was false and unjust, than to support truth and virtue, this disingenuous conduct, by which they frequently imposed upon weak minds, brought discredit both upon themselves and their profession. And therefore the word *sophist*, or *sophister*, has been more generally used in an ill sense, to signify one skilled rather in the arts of cavilling, than qualified to speak well and accurately upon any subject.

History of oratory.—The invention of oratory is by the Egyptians and the fables of the poets ascribed to Mercury. Quintilian says 'The faculty of speech we derive from nature; but the art from observation.' But no certain account can be given when, or by whom, this art first

began to be cultivated. We learn from Homer that the art was very early in high esteem among the Greeks, as that poet greatly celebrates Nestor and Ulysses for their eloquence. Quintilian says that afterwards Empedocles is the first upon record who attempted any thing concerning it. And he, by Sir Isaac Newton's account, flourished about 500 years after Troy was taken. Cicero says, 'Though some had spoken well before Corax and Tisias, yet none with order and method.' But Gorgias had a golden statue erected to him at Delphos, an honor conferred upon him only; and he is said to have been so great a master of oratory, that, in a public assembly, he would undertake to declaim immediately upon any subject proposed to him. He wrote, as Cicero informs us, in the demonstrative or laudatory way; which requires most of the sublime, and makes what Diodorus Siculus says of him the more probable, that 'he first introduced the strongest figures, members of periods opposite in sense, of an equal length, or ending with a like sound, and other ornaments of that nature.' And hence those figures which give the greatest force and lustre to a discourse were anciently called by his name. Cicero tells us farther that Thrasymachus and Gorgias were the first who introduced numbers into prose, which Isocrates afterwards brought to perfection. Quintilian likewise mentions Protagoras, Gorgias, Prodicus, and Thrasymachus, as the first who treated of common places, and showed the use of them. Plato wrote an elegant dialogue upon this subject, which is still extant, entitled *Gorgias*.

Isocrates was the most renowned of all Gorgias's scholars. Cicero extols him as the greatest master and teacher of oratory; 'whose school, like the Trojan horse, sent forth many great men.'

Aristotle was chiefly induced to engage in this province from an emulation of his glory. Quintilian says they both wrote upon the art, though there is no system of the former extant. But that of Aristotle is esteemed the best and most complete of any in the Greek language. In this age the Grecian eloquence appeared in its highest perfection. Demosthenes was a hearer both of Isocrates and Plato, as also of Isæus (ten of whose orations are yet extant); and by his surprising genius, and indefatigable industry, made such advantage of their precepts, that he has been always esteemed by the best judges the prince of Grecian orators. His great adversary and rival Æschines, after his banishment, is said to have gone to Rhodes, and employed his time there in teaching rhetoric. Theodectes and Theophrastus, both scholars of Aristotle, imitated their master in writing upon the art. And from that time the Greek philosophers, especially the stoics and peripatetics, applied themselves to lay down the rules of oratory; which Socrates had before separated from the province of a philosopher. There is preserved a treatise upon this subject, which some ascribe to Demetrius Phaleræus, though others, more probably, to Dionysius of Halicarnassus. Quintilian mentions several other rhetoricians in the following ages, who were likewise writers; as Hermagoras, Athenæus, Apollonius, Molo, Areus Cæcilius, Dionysius of Halicarnassus, Apollonius of Pergamus, and Theodore of Gadara. But of these nothing now remains upon the subject of oratory, except some tracts of Dionysius, who flourished in the reign of Augustus. But some eminent writers on this subject have appeared among the Greeks since the time of Quintilian, particularly Hermogenes, and Longinus, the author of the incomparable treatise of the Sublime.

It was long before the Romans cultivated this art, and not without difficulty at first. The reason was, that for several ages they were wholly addicted to military affairs. Therefore, so late as A. U. C. 592, when by the industry of some Grecians the liberal arts began to flourish in Italy, a decree passed the senate, by which all philosophers and rhetoricians were ordered to depart out of Rome. But in a few years after, when Carneader, Critolaus, and Diogenes, who were not only philosophers but orators, came ambassadors from Athens to Rome, the Roman youth were so charmed with the eloquence of their harangues, that they could no longer be stopped from pursuing the study of oratory. And, by a further acquaintance with the Greeks, it soon came into such esteem, that persons of the first quality employed their time and pains to acquire it. Seneca tells us, that Lucius Plotius, a Gaul, was the first who taught the art of oratory at Rome in Latin; which, Cicero says, was while he was a boy. Seneca adds, that this profession continued for some time in the hands of freed men; and that the first Roman who engaged in it was Blandus, of the equestrian order, who was succeeded by others; some of whose lives are extant, written by Suetonius, as many of the Grecians are by Philostratus and Eunapius. Quintilian likewise gives us the names of those Romans who wrote upon the art. 'The

first,' says he, 'who composed any thing upon the subject, was M. Cato the censor; and after him Antony the orator; which is the only work he has left, and that imperfect. Then followed some of less note. But he who carried eloquence to its highest pitch among us was Cicero; who has, likewise, by his rules, given the best plan both to practise and teach the art. Cornificius wrote largely upon the subject; Stertinius, and Gallio, the father, each of them something. But Celsus and Lenas were more accurate than Gallio: and in our times Virginius, Pliny, and Rutilius. Time has deprived us of most of the writers mentioned by Quintilian. But we have the less reason to regret this; inasmuch as, besides his Two Books of Invention, which Quintilian here calls his Books of Rhetoric, there are extant his Three Books of an Orator; one of Famous Orators; and another entitled The Orator; also his Topics, a preface concerning the best sort of Orators; and a treatise of the Parts of Oratory. Each of these treatises, whether we regard the justness and delicacy of the thoughts, the usefulness of the rules, or the elegance and beauty of the style, deserves to be frequently perused by all lovers of eloquence. But the four books to Herennius, which are published among Cicero's works, seem with good reason to be attributed to Cornificius.

Celsus, whom Quintilian places among the best rhetoricians, is also said to have taught oratory. His eight books of Medicine are yet extant, written in so beautiful a style as plainly shows him a master of eloquence. But Quintilian himself excelled all who went before him in diligence and accuracy as a writer. His Institutions are so comprehensive, and written with such exactness and judgment, that they are generally allowed to be the most perfect work of the kind. There were some other orators in the following ages, whose works are extant; but, as they contain nothing of moment, it is unnecessary to enumerate them. The archbishop of Cambray gives it as his opinion, that the method of forming the system of oratory is to collect it from the finest precepts of Aristotle, Cicero, Quintilian, Longinus, and other celebrated authors of antiquity.

Objects and divisions of oratory.—The business of oratory is to teach us to speak well; which, as Cicero explains it, is to speak justly, methodically, floridly, and copiously.

It consists of four parts; invention, disposition, elocution, and pronunciation. Every one who aims to speak well and accurately upon any subject, pursues such thoughts as seem most proper to explain and illustrate the thing upon which he designs to discourse. And, if the nature of it requires that he should bring reasons to confirm what he says, he not only seeks the strongest, and such as are like to be best received, but prepares to answer any objection which may be offered to the contrary. This is invention. After this he considers how he can best arrange those arguments which have occurred to his mind, that they may appear in the plainest light, and not lose their force by disorder and confusion. This is disposition. His next care is to give his thoughts an agreeable dress; by selecting the

most proper words, clearest expressions, smooth and harmonious periods, with other ornaments of style, as may best suit the nature of his subject, brighten his discourse, and render it most entertaining to his hearers. This is elocution. The last thing is to deliver what he has thus composed with a just and agreeable pronunciation. And daily experience convinces us how much this contributes both to engage the attention, and impress what is spoken upon the minds of the hearers.

PART I.

OF INVENTION.

I. Of invention in general; and particularly of common places, and the state of a cause.—Invention, in general, is the discovery of such things as are proper to persuade. To attain this end, the orator proposes three things: 1. To prove or illustrate the subject upon which he treats; 2. To conciliate the minds of his hearers, and to engage their passions in his favor; and, 3. As these require different kinds of arguments or motives, invention furnishes him with a supply for each of them. An argument, as defined by Cicero, is a reason which induces us to believe what before we doubted of. And, as different kinds of discourses require different arguments, rhetoricians have considered them two ways; in general, under certain heads, as a common fund for all subjects; and, in a more particular manner, as they are suited to demonstrative, deliberative, or judicial discourses.

Extensive knowledge is the noblest fund of invention. An orator, therefore, should be furnished with a stock of important truths, solid maxims, and a variety of knowledge, collected both from observation and acquaintance with the liberal arts; that he may not only be able to express himself in the most agreeable manner, but likewise to support what he says with the strongest and clearest arguments. But, as all have not the same opportunity to cultivate their minds with learning and knowledge, art has prescribed a method to lessen in some measure, these difficulties, and help every one to a supply of arguments upon any subject. And this has been done by common places, which Cicero calls the seats or heads of arguments, and, by a name from the Greek, topics. They are of two sorts, internal and external.

1. *Internal topics* arise from the subject upon which the orator treats; and are therefore distinguished from external, which he fetches from without, and applies to his purpose. Cicero and Quintilian make them sixteen; of which three comprehend the whole thing they are brought to prove, namely, definition, enumeration, and notation; of the remaining thirteen, some contain a part of it, and the rest its various properties and circumstances, with other considerations relating to it; these are, genus, species, antecedents, consequents, adjuncts, conjugates, cause, effect, contraries, opposites, similitude, dissimilitude, and comparison. Definition explains the nature of the thing defined, and shows what it is. Enumeration takes in all the parts of a thing. And from this we prove, that what

agrees to all the parts agrees to the whole. Notation, or etymology, explains the meaning or signification of a word. Genus contains under it two or more species of things, differing in nature. Species is that which comprehends under it all the individuals of the same nature. Antecedents are such things, as, being once allowed, others necessarily, or very probably, follow. Consequents are such things, as, being allowed, necessarily or very probably infer their antecedents. Adjuncts are separable properties of things, or circumstances that attend them. These are very numerous, and afford a great variety of arguments. They do not necessarily infer their subject; but, if fitly chosen, render a thing credible, and are a good ground for assent. Conjugates are words deduced from the same origin with that of our subject. By these the habit is proved from its acts. A cause is that by the force of which a thing does exist. There are four kinds of causes, matter, form, efficient, and end, which afford a great variety of arguments. The way of reasoning from them is to infer the effect from the cause. An effect is that which arises from a cause, therefore the cause is proved by it. Contraries are things, which, under the same genus, are at the utmost distance from each other; so that what we grant to the one we deny the other. Opposites are things, which, though repugnant to each other, yet are not directly contradictory: as, To love and to injure, to hate and to commend. They differ from contraries in this, that they do not absolutely exclude one another. Similitude is an agreement of things in quality. Dissimilitude is a disagreement of things in quality. Comparison is made three ways; for either a thing is compared with a greater, with a less, or with its equal. This, therefore, differs from similitude on this account, that the quality was considered in that, but here the quantity. From this account of common places, as laid down by the orators of ancient Greece and Rome, it is easy to conceive what a large field of discourse they open to the mind upon every subject. 'One who had no other aim,' says Dr. Blair, 'but to talk copiously and plausibly, by consulting them on every subject, and laying hold of all that they suggested, might discourse without end; and that too, though he had only the most superficial knowledge of his subject. But such discourse could be no other than trivial. What is truly solid and persuasive must be drawn from a thorough knowledge of the subject, and profound meditation on it. They who would direct students of oratory to any other sources of argumentation, only delude them; and, by attempting to render rhetoric too perfect an art, they render it, in truth, a trifling and childish study.'

2. *External topics* are all taken from authorities, and have one general name, Testimony. All testimonies may be distinguished into two sorts, divine and human. A divine testimony, when certainly known to be such, is incontestable, and admits of no debate. Human testimonies, considered as furnishing the orator with arguments, may be reduced to three heads; writings, witnesses, and contracts. The occasion of dispute respecting written testimonies, which may afford

the orator an opportunity of displaying his abilities, may arise from five circumstances, viz. ambiguity, disagreement between words and intention, contrariety, reasoning, and interpretation. Of these it would be superfluous to give examples.

3. *Of the state of a controversy.*—The ancients, observing that the principal question or point of dispute in all controversies might be referred to some particular head, reduced those heads to a certain number, that both the nature of the question might thus be better known, and the arguments suited to it be discovered with greater ease. And these heads they call states. The number of these states both Cicero and Quintilian reduce to three; and tell us that three things may be enquired into in all disputes: Whether a thing is? what it is? and how it is?

II. *Of arguments suited to demonstrative discourses.*—These consist either in praise or dispraise; and, agreeably to the nature of all contraries, one of them will serve to illustrate the other. Either persons or things may be the subjects of praise.

1. In praising or dispraising persons, rhetoricians prescribe two methods: 1. To follow the order in which every thing happened that is mentioned in the discourse; 2. To reduce what is said under certain general heads, without a strict regard to the order of time. i. In pursuing the former method, the discourse may be very conveniently divided into three periods. The first of which will contain what preceded the person's birth; the second the whole course of his life; and the third what followed upon his death. ii. The other method is to reduce the discourse to certain general heads, without regarding the order of time. As if any one, in praising the elder Cato, should propose to do it, by showing that he was a most prudent senator, an excellent orator, and most valiant general.

1. In praising things, all beings inferior to man may be proper subjects for praise or dispraise; whether animate or inanimate; whether ideal or real; as virtues, vices, countries, cities, &c. But what chiefly claim the attention of the orator, as subjects of praise or dispraise, are the actions of men.

III. *Of arguments suited to deliberative discourses.*—This kind of discourse must have been very ancient; since, doubtless, from the earliest period of men conversing together, they deliberated upon their common interest, and offered their advice to each other. But neither those of the laudatory nor judicial kind could be introduced till mankind were settled in communities. The early practice of suatory discourses appears from sacred writ, where we find that, when Moses was ordered upon an embassy into Egypt, he would have excused himself for want of eloquence. And Homer represents the Greeks at the siege of Troy, as anxiously running to hear their generals harangue them. Nor is this part of oratory less conspicuous for its usefulness to mankind than for its antiquity; being highly beneficial either in councils, camps, or any societies of men. How many instances have we upon record, where the fury of an enraged multitude has been checked and appeased by the

prudent and artful persuasion of some particular person! The story of Menenius Agrippa, who pacified the commons of Rome, when they withdrew from the senators, and retired out of the city, by his fable of the Belly deserted by the other members, is well known. And how often have armies been fired to the most dangerous exploits, or recalled to their duty, when ready to mutiny, by a moving speech of their general!

The principal heads of argument proper for advice are those taken from the nature of the thing under consideration. 1. *Pleasure* often affords a very cogent argument in discourses of this nature. 2. *Profit* or advantage has no less influence upon mankind than the former; and, when it respects things truly valuable, it is a very just and laudable motive. 3. *Honor*, than which no argument will sooner prevail with generous minds, or inspire them with greater ardor.

But although a thing, considered in itself, appear beneficial if it could be attained, yet the expediency of undertaking it may still be questionable; in which case the following heads, taken from the circumstances which attend it, will afford proper arguments to engage in it:— 1. The *possibility* of succeeding may sometimes be argued as one motive to this end. 2. But an argument founded upon *probability* will be much more likely to prevail. 3. But as even probability is not a motive strong enough with many persons to engage in the prosecution of a thing which is attended with considerable difficulties, it is often necessary to represent the *facility* of doing it, as an additional reason. 4. If the thing advised can be shown to be in any respect *necessary*, this will render the motive still much stronger for undertaking it. 5. To these heads may be added the consideration of the *event*, which in some cases carries great weight with it. As when we advise to the doing of a thing from this motive, That whether it succeed or not, it will yet be of service to undertake it.

These are the principal heads which furnish the orator with proper arguments in giving advice. But no small skill and address are required in giving it. For since the tempers and sentiments of mankind, as well as their circumstances, are very various, it is often necessary to accommodate the discourse to their opinions and prejudices. And therefore the weightiest arguments are not always the most proper and fittest to be used on all occasions. Cicero, in treating upon this subject, distinguishes mankind into two sorts; the ignorant, who always prefer profit to honor; and such as are civilized, who prefer honor and reputation.

IV. *Of arguments suited to judicial discourses.*—In judicial controversies there are two parties; the plaintiff or prosecutor, and the defendant or person charged. The subject is always something past, and the ends proposed by them Cicero calls equity or right; the former of which arises from the laws of the country, and the latter from reason and the nature of things.

All judicial causes are either private or public. Private causes, or civil causes, relate to the right of particular persons. Public causes are those which relate to public justice and the government of the state; which are also called

criminal, because by them crimes are prosecuted, whether capital, or of a less heinous nature. We need only take the heads of the arguments from this last kind, because they are more copious, and easy to be illustrated; whence such as agree to the former will sufficiently appear. 1. The *conjectural* state. When the accused person denies the fact, there are three things which the prosecutor has to consider: whether he would have done it, whether he could, and whether he did it. And hence arise three topics; from the will, the power, and the signs or circumstances which attended the action. The affections of the mind discover the will; as passion, an old grudge, a desire of revenge, a resentment of an injury, and the like. The second head is the power of doing a thing; and there are three things which relate to this, the place, the time, and opportunity. The third head comprehends the signs and circumstances which either preceded, accompanied, or followed, the commission of the fact. So threats, or the accused person being seen at or near the place before the fact was committed, are circumstances that may probably precede murder; fighting, crying out, bloodshed, are such as accompany it; paleness, trembling, inconsistent answers, hesitation, or faltering of the speech, something found upon the person accused which belonged to the deceased, are such as follow it. These are the topics from which the prosecutor takes his arguments. The business of the defendant is to invalidate these. Therefore such as are brought from the will, he either endeavours to show are not true, or so weak as to merit very little regard. And he refutes those taken from the power, by proving that he wanted either opportunity or ability; as, if he can show, that neither the place nor time insisted on was at all proper; or that he was then in another place. In like manner he will endeavour to confute the circumstances, if they cannot be directly denied, by showing that they are not such as necessarily accompany the fact, but might have proceeded from other causes, though nothing of what is alleged had been committed; and it will be of great service to assign some other probable cause.

2. The *definitive* state, which is principally concerned in defining and fixing the name proper to the fact; though orators seldom use exact definitions, but commonly choose larger descriptions, taken from various properties of the subject or thing described. The heads of argument in this state are much the same to both parties. For each of them defines the fact his own way, and endeavours to refute the other's definition.

3. The third state is that of quality, in which the dispute turns upon the justice of an action. And here the defendant does not deny he did the thing he is charged with; but asserts it to be right and equitable, from the circumstances of the case, and the motives which induced him to it.

4. Lastly, a fact is sometimes rather excused than defended, by pleading that it was not done designedly, or with any ill intent. This is called *concession*; and consists of two parts, apology

and intreaty. The former represents the matter as the effect of inadvertency, chance, or necessity.

V. *Of the character and address of an orator.*

—Having considered and explained the first part of invention, which furnishes the orator with such arguments as are necessary for the proof of his subject, we are next to show what are the proper means to conciliate the minds of his hearers, to gain their affection, and to recommend both himself and what he says to their good opinion and esteem. This is by Quintilian called propriety of manners. And he adds, it is necessary 'that every thing appear easy and natural, and the disposition of the speaker be discovered by his words.' There are four qualities said to be suited to the character of an orator, which should appear in his discourses, to render what he says acceptable to his hearers; and these are, wisdom, integrity, benevolence, and modesty. It is the orator's business to consider the various characters and circumstances of life, with the different bias and way of thinking they give to the mind; that he may so conduct himself in his behaviour and manner of speaking as will render him most acceptable, and gain him the good esteem of those whom he addresses.

VI. *Of the passions.*—As it is often highly necessary for the orator, so it requires his greatest skill, to engage the passions in his interest. Where persons will neither be convinced by reason, nor moved by the authority of the speaker, the only way left to put them upon action is to engage their passions. The passions may be separately referred, either to demonstrative, deliberative, or judicial discourses; though they are not confined to any of them. 1. To the demonstrative kind we may refer joy and sorrow, love and hatred, emulation and contempt. 2. To deliberative discourses may be referred fear, hope, and shame. 3. To judicial discourses may be referred anger and lenity, pity and indignation.

These are the passions with which an orator is principally concerned. In addressing which, not only the greatest warmth and force of expression is often necessary, but he must likewise first endeavour to impress his own mind with the same passion he would excite in others. A man may convince, and even persuade others to act, by mere reason and argument. But that degree of eloquence which gains the admiration of mankind, and properly denominates one an orator, is never found without warmth or passion. Passion, when in such a degree as to rouse and kindle the mind, without throwing it out of the possession of itself, is universally found to exalt all the human powers. It renders the mind more enlightened, penetrating, vigorous, and masterly, than it is in its calm moments. A man actuated by a strong passion becomes much greater than he is at other times. He is at no loss for words and arguments. He transmits to others, by a sort of contagious sympathy, the warm sentiments which he feels; his looks and gestures are all persuasive; and nature here shows herself infinitely more powerful than art.

PART II.

OF DISPOSITION.

As invention supplies the orator with necessary materials, so disposition directs him how to place them in the most proper order. What is here chiefly intended by it is, the placing the several parts of a discourse in a just method and dependence upon one another. Writers are not all agreed in determining the parts of an oration: though the difference is rather in the manner of considering them than in the things themselves. Cicero mentions six, viz. introduction, narration, proposition, confirmation, confutation, and conclusion.

I. *Of the introduction.*—The design of the introduction is to prepare the minds of the hearers for a suitable reception of what is to follow. For this end, three things are requisite; that the orator gain the good opinion of his hearers, that he secure their attention, and give them some general notion of his subject. As to attention, Cicero says, 'We shall be heard attentively on one of these three things; if we propose what is great, necessary, or for the interest of those to whom the discourse is addressed. Some general account of the subject of the discourse is always necessary. For every one expects to be soon informed of the design of the speaker, and what he proposes to treat of. These are the heads which commonly furnish matter for this part of a discourse. In some cases, orators have recourse to a more artful way of opening their subject, endeavouring to remove jealousies, apologise for what they are about to say, and seem to refer it to the candor of the hearers to judge of it as they please. This is called insinuation; and may be necessary, where a cause is in itself doubtful, or may be thought so from the prejudices of the hearers, or the impressions already made upon them by the contrary side. An honest man would not knowingly engage in a bad cause; and yet, through prevailing prejudice, that may be so esteemed which is not so in itself. In these cases great prudence is necessary to give such a turn to things as may be least liable to offence.'

II. *Of narration.*—The orator having prepared his hearers to receive his discourse with candor, and acquainted them with his general design, before he proceeds directly to his subject, often finds it necessary to give some account of what preceded, accompanied, or followed upon it. And this he does to enlarge the view of the particular point in dispute, and place it in a clearer light. This is called narration; which is a recital of something done, in the order and manner in which it was done. Those things which properly enter into a narration are the cause, manner, time, place, and consequences of an action; with the temper, fortune, views, ability, associates, and other circumstances of those concerned in it. In relating a fact, the orator describes it in so strong and lively a manner as may give the greatest evidence to his hearers, and make the deepest impression upon their minds. There are four properties required in a good narration; that it be short, perspicuous, probable, and interesting.

III. *Of the proposition.*—In every regular discourse, the speaker's intention is to prove or illustrate something. And, when he lays down his subject in a distinct and express manner, this is called the proposition. Orators use several ways in laying down the subject of their discourses. Sometimes they do it in one general proposition. At other times, to give a clearer and more distinct view of their discourse, they subjoin to the proposition the general heads of argument by which they endeavour to support it. But when the subject relates to several different things, which require to be separately laid down in distinct propositions, it is called a partition. Some have made two kinds of partition, one called separation, and the other enumeration. By the former, the orator shows in what he agrees with his adversary, and wherein he differs from him. By the latter he acquaints his hearers with the several parts of his discourse upon which he designs to treat. And this alone, properly speaking, is a partition. There are three things requisite in a good partition; that it be short, complete, and consist but of a few members. A just partition is attended with considerable advantages. It gives both light and ornament to a discourse. In a sermon, or a pleading at the bar, few things are of greater consequence than a proper division. It should be studied with much care; for, if one take a wrong method at first setting out, it will lead him astray in all that follows, and render the whole discourse either perplexed or languid.

IV. *Of confirmation.*—The orator, having acquainted his hearers, in the proposition, with the subject on which he designs to discourse, usually proceeds either to prove or illustrate what he has laid down. Some discourses require nothing more than an illustration, to set them in a proper light, for which reason, they have often no distinct proposition. But, where arguments are brought in defence of the subject, this is properly confirmation. Cicero defines 'confirmation, that which gives proof, authority, and support, to a cause, by reasoning.' If any thing in the proposition seems obscure, or liable to be misunderstood, the orator first explains it, and then offers such arguments in proof of it, and represents them in such a light, as seem most proper to gain the assent of his hearers. Two methods of reasoning are employed by orators, the synthetic and analytic.

1. Every piece of synthetic reasoning may be resolved into a syllogism or series of syllogisms. As a logical syllogism consists of three parts or propositions, a rhetorical syllogism frequently contains four or five. Cicero reckons this last the most complete. But all that is said in confirmation of either of the premises is accounted but as one part. But orators do not often use complete syllogisms, but most commonly enthymemes. An enthymeme is an imperfect syllogism, consisting of two parts; the conclusion, and one of the premises: and, in this kind of syllogism, that proposition is omitted, whether it be the major or minor, which is sufficiently manifest of itself, and may easily be supplied by the hearers. But the proposition that is expressed is usually called the antecedent, and

the conclusion of the consequent. It is reckoned a beauty in enthymemes when they consist of contrary parts: because the turn of them is most acute and pungent. Such is that of *Micipsa* in *Sallust*: 'What stranger will be faithful to you who are an enemy to your friends?' Orators manage enthymemes in the same manner they do syllogisms; that is, they invert the order of the parts, and confirm the proposition by one or more reasons: and therefore a rhetorical enthymeme frequently consists of three parts, as a syllogism does of five. Though, strictly speaking, a syllogism can consist of no more than three parts, and an enthymeme but of two.

2. The other method of reasoning is the analytic, in which the orator conceals his intention concerning the point he is to prove, till he has gradually brought his hearers to the designed conclusion. They are led on, step by step, from one known truth to another, till the conclusion be stolen upon them, as the natural consequence of a chain of propositions. Under the analytic may be comprehended reasoning by example. Rhetoricians use this word in a different sense from the common acceptation. In oratory the word example is used for any kind of similitude; or, as *Vossius* defines it, 'when one thing is inferred from another, by reason of the likeness which appears between them.' Hence it is called an imperfect induction, which infers something from several others of the like nature, and has always the greatest force when the examples are taken from facts. But comparisons are sometimes made between facts and other things, to infer some difference or opposition between them. In comparing two facts, on account of some disagreement and unlikeness, the inference is made from the difference between one and the other in that particular respect only. Thus we have given a brief account of the principal methods of reasoning used by orators. As to the disposition of arguments, or the order of placing them, some advise to put the weaker, which cannot wholly be omitted, in the middle: and such as are stronger partly in the beginning, to gain the esteem of the hearers, and render them more attentive; and partly at the end, because what is last heard is likely to be retained longest: but, if there are but two arguments, to place the stronger first, and then the weaker; and after that to return to the former, and insist principally upon it. But this must be left to the prudence of the speaker. Nor ought arguments to be crowded too closely upon one another; for that takes off from their force, and does not leave the hearers sufficient time duly to consider them.

V. *Of confutation.*—The forms of reasoning here are the same as have been explained under confirmation. Confutation, however, is often the more difficult task; because he who is to prove a thing comes usually prepared; but he who is to confute it is frequently left to a sudden answer. Therefore, not only a good judgment, but a readiness of thought is necessary. Those arguments that are foreign to the subject may in a very few words be shown to be insignificant. There ought also to be a distinction made between such things as relate to the

subject, according to their importance. Those that appear to have no great weight should be slightly remarked; and are generally better turned off with an air of neglect, a pungent question, or an agreeable jest, than confuted by a serious and labored answer. But those which relate to the merits of the cause may be confuted either by contradicting them, or by shewing some mistake in the reasoning, or their invalidity when granted.

Things may be contradicted several ways. What is apparently false may be expressly denied. And what the adversary cannot prove may likewise be denied. It is a handsome way of contradicting a thing, by showing that the adversary himself maintained the contrary. An adversary is never more effectually silenced than when he is charged with contradictions; for this is stabbing him with his own weapon. Sometimes a thing is not in express terms denied, but represented to be utterly incredible. And this method exposes the adversary more than a bare denial. There is likewise an ironical way of contradicting a thing, by retorting that and other things of the like nature upon the adverse party. Such an unexpected return is sometimes of great service to abate the confidence of an adversary.

A second method of confutation is, by observing some flaw in the reasoning of the adverse party. Syllogisms may be refuted, either by showing some mistake in the premises, or that the conclusion is not justly deduced from them. Enthymemes may be refuted, either by showing that the antecedent is false, or the consequent not justly inferred from it. As to induction and example, by which the truth or equity of a thing is proved from its likeness to other things, the reasoning is invalid if the things so compared can be shown not to have that similitude or agreement on which the inference is founded. The last method of confutation is when the orator does in some sense grant the adversary his argument, and at the same time shows its invalidity. This is done by a variety of ways, according to the nature of the subject. Sometimes he allows what was said may be true; but pleads that what he contends for is necessary. At other times he pleads that, although the contrary opinion may seem to be attended with advantage, yet that his own is more just or honorable. Such was the case of *Regulus*. Another way of confutation is by retorting upon the adversary his own argument. The orator takes this advantage where an argument proves too much, that is, more than the person intended who made use of it. Inversion resembles this, by which the orator shows that the reasons offered by the opposite party make for him. Sometimes the charge is acknowledged, but the crime shifted off to another. Another method is to alleviate the charge, and take off the force or it, by showing that the thing was not done with that intention which the adversary insinuates. Such are the methods of confutation used by orators, in answering arguments brought by the contrary party. But sometimes they raise such objections themselves to what they have said as they imagine may be made by others;

which they afterwards answer, the better to induce their hearers to think that nothing considerable can be offered against what they have advanced, but what will admit of an easy reply. This is an effectual way of defeating an adversary, when the objection is well stated, and clearly answered.

VI. *Of the conclusion.*—Rhetoricians make the conclusion of a discourse to consist of two parts: recapitulation, and an address to the passions.

1. Recapitulation is a summary account of what the speaker has before offered in maintenance of his subject; and is designed both to refresh the memory of the hearers, and to bring the principal arguments together into a narrow compass, that they may appear in a stronger light. There are several things necessary to a good recapitulation. (1.) It must be short and concise, as it is designed to refresh the memory, and not to burden it. The chief things only are to be touched, on which the cause principally depends; the general heads of the discourse, with the main arguments brought to support them. (2.) They should be recited in the same order in which they were at first laid down. The hearers will thus be enabled better to keep pace with the speaker as he goes along. Every thing ought to be represented in the strongest terms, and in so lively a manner as may at the same time both entertain the audience, and make the deepest impression upon their minds. Sometimes a repetition is made, by running a comparison between the speaker's own arguments and those of the adverse party. But when the discourse is very long, and the arguments insisted on have been many, to prevent the hearers losing patience by a more particular recital, the orator sometimes only just mentions such things as he thinks of least consequence by saying that he omits or passes over them, till he comes to what is of greater moment, which he represents more fully. And this is what the writers upon this art call *preterition*.

2. By an address to the passions, the orator sometimes endeavours occasionally to work upon his hearers in other parts of his discourse, but especially in the conclusion, where he is warmest himself, and labors to make them so. For the main design of the introduction is to conciliate the hearers; of the narration, proposition, and confirmation, to inform them; and of the conclusion, to move them. And, therefore, says Quintilian, 'here all the springs of eloquence are to be opened. It is here we secure the minds of the hearers, if what went before was well managed. Now we are past the rocks and shallows, all the sails may be hoisted.' And, as the greatest part of the conclusion consists in illustration, the most pompous language and strongest figures have place here. The passions, which the orator addresses, differ according to the nature of the discourse. In demonstrative orations, when laudatory,—love, admiration, and emulation, are usually excited; but, in invectives,—hatred, envy, and contempt. In deliberate subjects, either the hope of gratifying some desire is set in view, or the fear of some impending evil. And, in judicial discourses, almost

all the passions have place, but more especially resentment and pity. But the same passion may be excited by very different methods. Horace endeavours to recommend virtue by laughing vice out of countenance; Persius moves us to an abhorrence of vice, with the severity of a philosopher; and Juvenal by open and vehement invectives. So orators make use of all these methods, but they should not dwell long upon the same passion. When the emotion is once carried as high as it can be, the hearers should be left under its influence.

Orators sometimes endeavour to raise contrary passions, as they are concerned for opposite parties. So the accuser excites anger and resentment, but the defendant pity and compassion. But the orator should always express the same passion himself with which he endeavours to affect others, in his action, voice, language, words, and expression. But a decency and propriety of character is always to be observed. This justness of character is admirably well observed by Cicero, in his defence of Milo; who being a man of most undaunted courage, it would have been improper to introduce him moving pity, and begging for mercy. Cicero therefore takes this part upon himself; and what he could not do with any propriety in the character of Milo, he performs in his own. But, as persons are commonly more affected with what they see than with what they hear, orators sometimes call in the assistance of that sense in moving the passions. For this reason it was usual among the Romans, in judicial cases, for accused persons to appear with a dejected air and a sordid garb, attended by their parents, children, &c., with the like dress and aspect. The Areopagites at Athens, if the orator began to say any thing which was moving, an officer immediately bade him be silent. There is certainly a medium between these extremes.

VII. *Of digression, transition, and amplification.*—Besides the number, order, and nature of the parts which constitute a complete and regular oration, explained in the preceding chapters, there are several other things necessary to be known by an orator, which come under the second branch of his art. These are, digression, transition, and amplification.

1. *Digression*, as defined by Quintilian, is, 'a going off from the subject we are upon to some different thing, which may, however, be of service to it.' As where a subject is of itself dry, or requires close attention, it relieves the mind by something entertaining. But they should neither be too frequent nor too long. Indeed orators sometimes, when sore pressed, and the cause will not bear a close scrutiny, artfully run into digressions, to divert the attention of the hearers from the subject, and turn them to a different view. And in such cases, to be unobserved, they do it tacitly, that they may get clear of a difficulty, till they enter upon some fresh topic.

2. *Transitions* are often used not only after a digression, but upon other occasions, and recapitulate in a few words both what has been said already, and what is next designed to be said. Where a discourse consists of several

parts, this is very proper, especially when the parts are of a considerable length; for it assists the hearers to carry on the series of the discourse in their minds. But sometimes, in passing from one thing to another, a general hint may be thought sufficient; at other times, for greater brevity, the transition is imperfect, and mention made only of the following head.

3. *By amplification* is meant, not barely enlarging upon a thing, but the representation of it in the fullest and most comprehensive view, so that it may in the liveliest manner strike the mind. Rhetoricians have observed several ways of doing this. One is to ascend from a particular thing to a general. Thus Cicero in his defence of Archias, having commended him as a poet, says many things in praise of polite literature in general. A contrary method is, to descend from generals to particulars. As if any one, while speaking in commendation of eloquence, should illustrate what he says from the example of Cicero, and show the services he rendered his country, and the honors he gained to himself, by his admirable oratory. A third method is the enumeration of parts. Such representations greatly enlarge the image of a thing, and afford the mind a much clearer view of it than if it were contracted into one single proposition: and a thing may likewise be illustrated by its opposite. Thus the blessings and advantages of peace may be recommended from the miseries and calamities of war.

4. *Gradation* is another beautiful way of doing this. As when Cicero would aggravate the cruelty and barbarity of Verres for crucifying a Roman citizen, by showing it to be a punishment only inflicted upon slaves. Facts may be amplified from their circumstances; as time, place, manner, event, and the like. As the design of amplification is not barely to prove the truth of things, but to adorn and illustrate them, it requires a florid and beautiful style, strong and emphatic words, flowing periods, harmonious numbers, lively tropes, and bright figures.

PART III.

OF ELOCUTION.

On this subject we need only here observe, that it has been divided by rhetoricians into three parts: elegance, composition, and dignity. A discourse which has all these properties suitably adjusted, must, with respect to the language, be perfect in its kind.

I. *ELEGANCE* consists in purity and perspicuity; both with respect to single words and their construction in sentences.

1. *Purity* includes the choice of such words and phrases as are agreeable to the use of the language in which we speak: and so grammarians reduce the faults they oppose to it to two, *barbarism* and *solecism*; the former of which respects single words, and the latter their construction. But in oratory, neither all words, nor all expressions are called pure which occur in language; but such only as come recommended by the authority of those who speak or write with accuracy and politeness. Orators must also abstain from antiquated or obsolete

words and phrases, as well as vulgar or sordid ones; and the use of new terms, until they have been established, should also be carefully avoided.

2. *Perspicuity*, as well as purity, consists partly in single words, and partly in their construction.

i. As to single words those will be best understood which are used in their proper sense; and all words may be divided into proper words and tropes. Tropes are such words as are applied to some other thing than what they properly denote, by reason of some similitude, relation, or contrariety between the two things. So, when a subtle man is called a fox, the reason of the name is founded in a similitude of qualities. If we say, Cicero will always live, meaning his works, the cause is transferred to the effect. All words must at first have had one original and primary signification, which, strictly speaking, may be called their proper sense. But, through length of time, words lose their original signification, and assume a new one, which then also becomes their proper sense. For example, the word knave anciently signified a servant.

Sometimes two or more words have the same signification, and may therefore be used synonymously. Of this kind are the words pity and compassion. There are other words of so near an affinity to each other, that they are commonly thought synonymous. Such are mercy and pity; though mercy in its strict sense is exercised towards an offender, and pity respects one in distress. This peculiar force and distinction of words is carefully to be attended to. Though words, when taken in their proper signification, generally convey the plainest and clearest sense, yet some are more forcible, sonorous, or beautiful, than others. And by these considerations we must often be determined in our choice of them. So whether we say, he got, or he obtained, the victory, the sense is the same: but the latter is more full and sonorous. As to tropes, though generally speaking they are not to be chosen where perspicuity is only designed, and proper words may be found; yet, through the penury of all languages, the use of them is often necessary. And some, especially metaphors, which are taken from the similitude of things, may, when custom has rendered them familiar, be considered as proper words, and used in their stead. Thus, whether we say, I see your meaning, or I understand your meaning, the sense is equally clear, though the latter expression is proper, and the former metaphorical.

ii. But perspicuity arises not only from a choice of single words, but likewise from the construction of them in sentences. For the meaning of all the words in a sentence, considered by themselves, may be very plain and evident; and yet, by a disorderly construction, or confusion of the parts, the sense of the whole may be obscured.

Ambiguity of expression is one cause of obscurity. This sometimes arises from the different senses in which a word is capable of being taken. In all serious discourses ambiguities ought carefully to be avoided. But obscurity more frequently arises from the ambiguous construction

of words, which renders it difficult to determine in what sense they are to be taken. Quintilian gives us this example: 'A certain man ordered in his will, that his heir should erect for him a statue holding a spear made of gold.' A question arose here, of great consequence to the heir, from the ambiguity of the expression, whether the words made of gold were to be applied to the statue or the spear.

Obscurity is also occasioned either by too short and concise a manner of speaking, or by sentences too long and prolix: and parentheses, when either too long or too frequent, have the same effect.

II. OF COMPOSITION.—Composition, in the sense here used, gives rules for the structure of sentences, with the several members, words, and syllables of which they consist, in such a manner as may best contribute to the force, beauty, and evidence of the whole. It consists of four parts, which rhetoricians call period, order, juncture, and number. The first treats of the structure of sentences; the second of the parts of sentences, which are words and members; and the two last of the parts of words, which are letters and syllables. For all articulate sounds, and even the most minute parts of language, come under the cognizance of oratory.

1. *Of period*.—In every sentence or proposition something is said of something. That of which something is said logicians call the subject, and that which is said of it the predicate: but, in grammatical terms, the former is a noun substantive, and the latter a finite verb, denoting affirmation, and some state of being, acting, or suffering. A simple sentence consists of one such noun and verb, with whatever else is joined to either or both of them. And a compound sentence contains two or more of them; and may be divided into so many distinct propositions as there are such nouns and verbs, either expressed or understood. Some sentences consist, either wholly or in part, of such members as contain in them two or more compound ones, which may, therefore, for distinction's sake, be called *decompound members*. In the proper distinction and separation of the members, in such complex sentences, the art of pointing chiefly consists. For the principal use of a comma is to divide the simple members, a semicolon the compound ones, a colon such as are decompounded, and a period the whole, from the following sentence. See PUNCTUATION.

Sentences, with respect to their form or composition, are distinguished into two sorts, called by Cicero *tracta*, straight or direct; and *contorta*, bent or winding. By the former are meant those whose members follow each other in a direct order, without any inflection; and by the latter those which strictly speaking are called periods. For *περιόδος* in Greek signifies a circuit or circle: and so the Latins call it *circuitus* and *ambitus*: by which both mean a sentence consisting of correspondent parts, so framed that the voice in pronouncing them may have a proper elevation and cadency, and distinguish them by its inflection; and as the latter part returns back, and unites the former, the period, like a circle, surrounds and encloses the whole sense. This ele-

VOL. XVI.

vation of the voice, in the former part of the period, is by the Greeks called *παρασις* and by the Latins *propositio*; and the depression of it, in the latter part, by the one *αποδοσις*, and by the other *reductio*. As simple sentences have not these correspondent parts which require any inflection of the voice, nor a circular form, by reason of their brevity, they are not properly periods, in the strict sense of the word: though, in common speech, the words sentence and period are used as equivalent terms. As to those compound sentences whose members follow each other in a direct order, without any inflection, there is little art required in their composition. Since such sentences, therefore, may be limited at pleasure, it seems more convenient both for the speaker and hearers to confine them to a moderate length.

But the principal art relating to this part of composition lies in the frame and structure of such compound sentences as are properly called periods. In the formation of these, two things are chiefly to be regarded; their length and cadency. As the length ought to be suited to the breath of the speaker, the ancient rhetoricians scarcely admit of more than four colons; by which we may understand compound members of a moderate size, which will be generally found a suitable and proportionate length. As to the cadency, Cicero has observed that the ears judge what is full and what is deficient; and direct us to fill up our periods, that nothing be wanting of what they expect. When the voice is raised at the beginning of a sentence, they are in suspense till it be finished; and are pleased with a full and just cadency, but are sensible of any defect, and displeased with redundancy. Therefore care must be taken that periods be neither deficient, and as it were maimed, so as to defraud the ears of what seemed to be promised them; nor, on the other hand, offend them by too long and immoderate excursions. This rise and cadency of the voice, in pronunciation, depend on the nature and situation of the members. By the word members is to be understood such as are uncompound. In a period of two members the turn of the voice begins with the latter member. If a sentence consist of three members, the inflection is best made at the end of the second; for, if it begin immediately after the first, the voice will be either apt to sink too low, and not to be heard, before it reach the end; or else be precipitated, to prevent it. But a period of four members is reckoned the most complete and perfect, where the inflection begins at the middle, that is with the third member. An equality of the members should also be attended to in the composition of a period, the better to adjust their rise and cadency. And for this reason, in sentences of three members, where the cadency begins with the third, or in those of four members, where it begins at the fourth, it promotes the harmony to make the last number longest. This is properly the nature of rhetorical periods, which, when rightly formed, have both beauty and dignity. But as all discourse is made up of distinct sentences, and whenever we express our thoughts it is in some of the forms above mentioned, so the use of them is not promiscuous, but suited to answer different

designs in speaking. And in this view they are considered and made use of by the orator. Examples of all these might be quoted from Cicero and other ancient orators; but it is unnecessary to swell this article with long quotations.

2. *Of order.*—Order is of two kinds, natural and artificial; and each of these may be considered with respect to the parts, either of simple or compound sentences. i. As to simple sentences, we call that order natural, when all the words in a sentence are so placed as they are connected with or follow each other in a grammatical construction. ii. Artificial order, as it respects simple sentences, has little or no regard to the natural construction of words; but disposes them in such a manner as will be most agreeable to the ear, and best answer the design of the speaker.

As to compound sentences, or such as consist of two or more members, either simple or compounded, what relates to the words in each member separately is the same as in simple sentences. But, with regard to the disposition of the several members, that is called the natural order which so places them as they mutually depend on each other. When this order is inverted, it is styled artificial. It is unnecessary to enlarge farther, or to adduce examples upon this subject, as it is discussed, and the beauties as well as defects of the analogous and transpositive languages pointed out under the article LANGUAGE.

But there are some other considerations relating to order, which, being taken from the nature of things, equally suit all languages. So, in amplifying, there should be a constant gradation from a less to a greater; as when Cicero says, ‘ambition creates hatred, shyness, discords, seditions, and wars.’ On the contrary, in extenuating, we should descend from a greater to a less; as if, speaking of the ancient laws of Rome, one should say, ‘they were so far from suffering a Roman citizen to be put to death, that they would not allow him to be whipt, or even to be bound. In constituting any whole, we put the parts first; as, ‘invention, disposition, elocution, and pronunciation, make up the art of oratory.’ But in separating any whole, the parts follow; as, ‘the art of oratory may be divided into these four parts; invention, disposition, elocution, and pronunciation.’ In every enumeration care must be taken not to mix the whole with the parts; but, if it be mentioned at all, it must either be put first or last. So it would be wrong to say ‘he was a man of the greatest prudence, virtue, justice, and modesty:’ for the word virtue here contains in it the other three, and therefore should not be inserted among them.

3. *Juncture and number* relate to letters and syllables; the former treating of their connexion, and the latter of their quantity.

Juncture respects the quality of syllables. A due attention is to be paid to the nature of the vowels, consonants, and syllables in the connexion of words, with regard to the sound. When a word ends with a vowel, and the next begins either with a different vowel, or the same repeated, it usually renders the pronunciation

hollow and unpleasant. Those which have the weakest and smallest sound follow best; because they occasion the least alteration of the organ in forming the two sounds. If a word end with a vowel, the next ought to begin with a consonant, or such a vowel whose sound may agree well with the former. But, if a word conclude with a consonant, either a vowel should follow, or such a consonant whose proper pronunciation will suit with it. And the same syllable ought not to be repeated at the end of one word, and the beginning of the next. This last, however, rarely happens in our language, which abounds with consonants.

4. *Number* respects the quantity of syllables. In the Greek and Roman languages every syllable has its distinct quantity; and is either long, short, or common: two or more of which joined together in a certain order make a foot, and a determinate number of these in a different order constitute their several sorts of verse. Though their prose was not so confined with regard to the feet, either as to the kind or place of them, as their metrical compositions, yet it had a sort of measure, more especially in the rise and cadency of their periods. This they called rhetorical number. But their rules are not applicable to our language, which has not that accurate distinction of quantity in its syllables. A great number of monosyllables do not sound well together. For as there ought to be a greater distance in the pronunciation between one word and another than between the syllables of the same word, such pauses, though short, yet, when too frequent, make the sound rough, and thus spoil its harmony. This is the more necessary to be attended to, because the English language abounds with monosyllables. On the contrary, a continuation of many long words makes a sentence move too slow and heavily. And, therefore, such periods generally run best which have a proper mixture of words of different lengths. Besides, as every word has its accent, which with us stands for quantity, a number, either of monosyllables or long words coming together, abates the harmony, as it lessens the variety. Several words of the same ending do not sound well together, especially where the accent falls upon the same syllable in each of them. For this creates too great a jingle by the similitude of sound; and displeases from an appearance of affectation. Of this kind is the following sentence: ‘Nothing is more welcome, delightful, or wholesome, than rest to a wearied man.’ In such expressions, if the order of the words cannot well be altered, some other word should be substituted in the room of one of them at least. But, if a sentence end with a monosyllable, it is apt to hurt the cadence, and disappoint the ear; whereas words of a moderate length carry a greater force with them by the fulness of their sound, and afford the ear what is expected. There is one sort of monosyllables, especially, which never sound well at the conclusion of a period, viz. the signs of cases; as when we say, ‘avarice is a crime which wise men are too often guilty of;’ instead of ‘avarice is a crime, of which wise men are too often guilty.’ Nor are very long words well suited either to the beginning or conclusion of a pe-

riod; for they retard the pronunciation at first, and fall too heavy at the end.

III. OF DIGNITY. Dignity chiefly consists in the right use of tropes and figures. It is not sufficient for an orator to express himself with propriety and clearness, or in smooth and harmonious periods; but his language should be suited to the nature and importance of the subject. And therefore, as elegance gives rules for the first of these, and composition for the second, so does dignity for the last. It is evident that different subjects require a different style and manner of expression; for, as Quintilian says, 'what is magnificent in one discourse would be turgid in another.' This variety in the manner of expression arises in a great measure from tropes and figures, which not only enliven and beautify a discourse, but give it likewise force and grandeur.

1. *Of tropes*.—A trope is a figure of words, and has been usually defined to be the change of a word from its proper signification to some other with advantage, either as to beauty or strength. But this definition is not strictly just; for, in every trope a reference is had to two things, which occasions two ideas; one of the thing expressed, and another of that to which it has a respect. For all tropes are taken, either from things internally or externally related; or from some similitude between them; or from a contrariety. The first of these is called synecdoche, the second metonymy, the third metaphor, and the last irony. The reasons which occasioned the introduction of tropes, as Quintilian observes, are three; necessity, emphasis, and beauty.

i. Tropes were first introduced from necessity, deriving their origin from the barrenness of language; because no language contains a sufficient number of proper words to express all the different conceptions of our minds: but the principal cause of their introduction seems to be that extensive influence which imagination possesses over every kind of speech. The mind considers the same thing various ways; views it in different lights; and compares it with other things. Hence it is furnished with an almost infinite number of ideas, which cannot all be expressed by proper words, since new ideas occur daily. And, were this possible, yet would it be impracticable; because the multitude of words must be so vastly great, that the memory could not retain them, nor recall them as occasion required. Tropes have remedied both these inconveniences. Thus, where a word is wanting to express any particular thing, it is clearly represented by the name of some other thing resembling it; the cause is signified by the effect, the subject by the adjunct, or the contrary, and the whole is often understood by a part, or a part by the whole. Thus, by the use of tropes, the mind is helped to conceive of something not expressed, from that which is expressed.

ii. A second use of tropes is emphasis. Tropes often express things with greater force than can be done by proper words. Sometimes a lively trope conveys a fuller and more just idea of a thing than a large periphrasis. Thus, when

Virgil calls the Scipios two thunderbolts of war, he gives a more lively image of the rapid force and speedy success of their arms than could have been conveyed by a long description in plain words. And in many cases the tropical use of words is so emphatical that in this respect it may be justly esteemed the most proper. So, incensed with anger, inflamed with desire, fallen into an error, are all metaphorical expressions, yet perhaps no proper words can be made use of which will convey a more lively image of the thing we design to represent by them.

iii. Beauty and ornament have been another cause of the use of tropes. Some subjects require a more florid and elegant dress than others. And it is the business of an orator to entertain his hearers while he instructs them. Cicero has observed, that 'as garments were first invented from necessity, to secure us from the injuries of the weather, but improved afterwards for ornament and distinction; so the poverty of language first introduced tropes, which were afterwards increased for delight.' As a moderate use of tropes, justly applied, beautifies and enlivens a discourse, so an excess of them causes obscurity, by running it into abstruse allegories and riddles. Tropes are not the ordinary dress of our thoughts, but a foreign habit; and therefore he who fills his discourse with a continued series of them, acts like one who appears in public in a strange dress. Care should also be taken not to transfer tropes from one language into another.

Primary tropes are subdivided into four species: 1. Metaphor; 2. Metonymy; 3. Synecdoche; 4. Irony.

1. A *metaphor* is usually defined, a trope, which changes words from their proper signification to another different from it, by reason of some similitude between them. But it is certain that a word, when used metaphorically, does not alter its signification, but retains its proper sense. Cicero calls a metaphor a similitude reduced to a single word. It is a similitude, when I say of a man, he has acted like a lion; and a metaphor, when I say, he is a lion. Metaphors are derived from every part of nature. 1. From similitudes between animate, and from similitudes between inanimate beings. 2. From similitudes between inanimate things and animals: and 3. Those are esteemed the finest and strongest which ascribe life and action to inanimate things. All forced and harsh metaphors should be avoided, nor should they be too numerous; in a word, they ought not to be used, but either where a proper word is wanting, or where they are more significant or beautiful than the proper word. See METAPHOR.

2. *Metonymy*, as defined by Quintilian, is the putting one word for another. But Vossius describes it more fully, when he calls it, 'a trope which changes the names of things that are naturally united, but in such a manner as that one is not the essence of the other.' A word used as a metonymy changes its sense, and denotes something different from its proper signification. Thus, when Mars is put for war, and Ceres for corn, they lose their personal sense, and stand for the effects of which those deities were said to be the cause. A metonymy is not so exten-

sive as a metaphor, nor altogether so necessary; because nothing is said by a metonymy which cannot be expressed in proper words; whereas metaphors are often used for want of proper words to express some ideas. However, metonymies enrich a discourse with an agreeable variety, and give both force and beauty to an expression. And some metonymies, in common discourse, are more frequently made use of than the proper words in whose room they are put. So, it is more usual to say, this is such a person's hand, or I know his hand, than his writing, when we intend this last sense of the word. Metonymies commonly receive their names from the cause and effect, the subject and the adjunct.

i. A metonymy of the cause is when the external cause is put for the effect; as tongue for language, sword for slaughter, &c.

ii. The second kind of metonymy puts the effect for the efficient cause, whether the agent, or only the means and instrument. So Virgil calls the two Scipios the destruction of Libya, because they were the agents who effected it.

iii. The third kind of metonymy is when the subject is put for the adjunct. Thus the seat of any faculty or affection is used for the faculty or affection itself. So it is usual to say, a man of a clear head, when we mean a clear mind; or of a warm heart, when we mean kind affections. Thus also the time is put for the persons living in it; as the degeneracy of the present age, the virtue of former times. The popish doctrine of transubstantiation is founded upon an abuse of this trope. For when our Saviour, speaking of the bread and wine then before him, says, 'this is my body, and this is my blood,' his plain meaning is they were the signs of his body and blood, the thing signified being put for the sign by this sort of metonymy. In like manner, our Saviour, in a metaphorical sense, calls himself a vine, and a door, expressions which even the Catholics themselves do not interpret literally.

iv. The fourth kind of metonymy is that wherein the adjunct is put for the subject. As when Virgil says, 'they lie down upon purple;' that is, upon couches died with purple. By this trope virtues and vices are put for the persons in whom they are found. As in that beautiful passage of Cicero, where, comparing the profligate army of Catiline with the forces of the state, he says, 'on this side modesty is engaged, on that impudence; on this chastity, on that lewdness; on this integrity, on that deceit; on this piety, on that profaneness; on this constancy, on that fury; on this honor, on that baseness; on this moderation, on that unbridled passion; in a word, equity, temperance, fortitude, prudence, and all virtues, engage with injustice, luxury, cowardice, rashness, and all vices.' A third use of this trope is by putting a thing for the time in which it was done. Thus we say of a person, he has served so many campaigns, meaning so many summers. Lastly, the sign is put for the thing it signifies; as, the crown for the regal dignity, and the sword for the authority of the magistrate.

3. *Synecdoche* is a trope by which either the whole of a thing is put for a part of it, or a part for the whole; so that the things whose ideas are

presented to the mind in this trope are internally related to each other. In a *synecdoche* the word retains its proper sense, and the expression is elliptical.

i. One species of *synecdoche* puts the genus for the species. Thus, virtue in general is sometimes used to denote some particular virtue; as, when Cicero mentions virtue as one of the four qualifications necessary in a general, he means greatness of mind.

ii. The second kind of *synecdoche* puts the species for the genus. Thus bread denotes any kind of food: as when a person is said to get his bread by his labor; and money is put for any kind of wealth.

iii. The third species is, when the essential whole is put for one of its parts; that is, either for the matter or form. Thus, it is usual to say of a deceased person, he was buried at such a time. And, in the inscriptions of sepulchral monuments, here lies such a one, that is, his corpse.

iv. The fourth kind of *synecdoche* is when either the matter or form is put for the whole being. Thus silver and gold are used to signify money made of those metals. And soul is put for the whole person. This way of speaking occurs nowhere more frequently than in the sacred writings. But sometimes only part of the matter stands to express the whole essence or being; thus, so many head of cattle means entire cattle.

v. By the fifth species of *synecdoche* the whole of any material thing or quantity, whether continued or discrete, is put for a part of it. So when Cicero says, a war is kindled through the whole world, he calls the Roman empire the world. The same figure is used by St. Luke, ch. ii. ver. i.

vi. The sixth and last kind of *synecdoche* puts a part of any material thing or quantity for the whole of it. So we say of a fleet, that it consists of so many sail; meaning so many ships. And by this trope, that is ascribed to a single person which was done by the assistance of others, and in conjunction with them: as when it is said, that Lord Nelson defeated the French at Aboukir. To this kind of *synecdoche* may also be referred expressions in which the singular number is put for the plural; as, a man is liable to be misled by irregular passions; meaning mankind in general.

4. *Irony* is a trope in which one contrary is signified by another: as if any one should say, well done; when his design is to intimate that the thing was ill done. Not that the word is changed from its usual signification; but, by the circumstances attending the expression, we perceive the contrary to what is spoken is intended. Quintilian observes, that an irony may be known by one of these three ways: 'By the manner of pronunciation, or from the nature of the person or the thing. For, where any of these do not suit with the words, it is plain the speaker intends the contrary.' The proper subjects of irony are vices and follies of all kinds; and this way of exposing them is often more effectual than serious reasoning. Socrates used it so much that he got the name of *εἰρωνεύειν*, that is, the droll.

II. *Secondary tropes* are so called, because:

they are all of the same nature with the former, and may be referred to some one or other of them, though they have received different names. They are eight in number; antonomasia, communication, litotes, euphemism, catachresis, hyperbole, metalepsis, and allegory. The three first are simple tropes, and may all be referred to synecdoche. But the five last are of a mixed or complex nature, and not confined to any one of the primary tropes.

1. *Antonomasia*.—A common or general word is sometimes used for the proper name of some particular thing or person, who upon any account is eminent and remarkable. So we say, he is gone to, or he came from the city, that is, London. By the Scriptures we mean the Bible. The orator is used for Cicero, the poet for Homer or Virgil, the philosopher for Aristotle; and the apostle for St. Paul. On the contrary, the proper names of things or persons are sometimes applied to any other of the same character. Thus we use the word gospel for any certain and undoubted truth. And punie faith proverbially stood for falsehood among the Romans.

2. *Communication*, among orators, signifies a change of persons. Sometimes, to prevent the imputation of pride, in assuming to themselves the praise of any laudable action, they ascribe it to their hearers, and do not say we, but ye, did so and so. At other times, when it is necessary to remind them of something they have done amiss, or to caution them against some wrong step, they take it upon themselves, or join themselves with them, and do not say, you have done this, or do not do this; but we have done it, or let us not do it. At other times, in compliment to their hearers, they join them as partners in the commendable actions or virtues of other persons. Such tropes often occur both in Demosthenes and Cicero.

3. But there is a mode of speech in which, by denying the contrary, more is intended than the words express. This is called litotes; and is often used where a person is led to say any thing in his own praise, or to soften an expression which in direct terms might give offence. As if one should say, I do not commend you for that; meaning, I greatly discommend or blame you for it.

4. When any displeasing or ungrateful thing is expressed by a more soft and agreeable word, it is called *euphemism*. As death carries in it a disagreeable idea, instead of saying a person is dead, we often say he is departed. But when St. Luke, speaking of Stephen, who was stoned to death, says he fell asleep; this is a beautiful metaphor.

5. *Catachresis* signifies in general any harsh trope, though it is most commonly found in metaphors. It is principally used by poets, to enforce an expression, where the proper word does not seem strong enough. As when Milton, in describing the angel Raphael's descent from heaven, says, he sails between worlds and worlds.

6. *Hyperbole* is the boldest of all tropes: for it exceeds the strict bounds of truth, and purposely represents things either greater or less, better or worse, than they really are. But the representation is made in such a manner as not to im-

pose on the hearers. The excess in this trope is called *auxesis*; as when we say of any thing that is very high, it reaches to the skies. The defect, or contrary extreme, is termed *meiosis*; so we say of a very lean person, he is nothing but skin and bones, or a mere skeleton. Those hyperboles which are expressed comparatively are commonly most emphatical. To say a thing is as light as a feather, carries the idea very far; but to say it is lighter, heightens it greatly.

7. Sometimes two or more tropes, and those of a different kind, are contained under one word; so that several gradations, or intervening senses, come between the word that is expressed and the thing designed by it. And this is called a *metalepsis*. The contests between Sylla and Marius proved very fatal to the Roman state. Julius Cæsar was then a young man. But Sylla, observing his aspiring genius, said of him, 'in this young man there are many Mariuses.' In this expression there is a *metalepsis*, containing a synecdoche, an antonomasia, and a metonymy. So that Sylla's meaning, divested of these tropes, was, that Cæsar would prove a most dangerous person to the Roman republic; which afterwards proved true.

8. *Allegory* is a continuation of several tropes in one or more sentences. Thus Cicero says, 'fortune provided you no field, in which your virtue could run and display itself;' where the words field and run are metaphors taken from corporeal things, and applied to the mind. But in allegories, care should be taken that the same kind of trope be carried through the whole, so as to compose one uniform and consistent set of ideas. It is likewise necessary that the allusions be all evident. These are called pure allegories. See ALLEGORY.

II. *Of figures*.—This term seems to have been borrowed from the stage, where the different habits and gestures of the actors, suitable to the several characters they sustained, were by the Greeks called *εὑρημα*, and by the Latins figure; and it is usual to say of a person, both with respect to his dress and action, that he makes a very bad, or a very graceful figure. As language is the dress of our thoughts, in which they appear to others; so any particular manner of speaking may be called its figure. But rhetoricians restrain the sense of the word to such forms of speech as differ from the ordinary ways of expression; as the theatrical habits of actors on the stage differ from their usual garb at other times. A figure, therefore, in the sense used by rhetoricians, is a mode of speaking different from, and more beautiful and emphatical than, the usual way of expressing the same sense.

Figures seem to have been among the last ornaments introduced into the art of oratory. Aristotle, who treats so accurately upon other parts, says very little of this. But the Greek writers who came after him have supplied that deficiency. They took notice of the several modes of expression, observed their force and beauty, and gave them distinctive names. And indeed they have treated the matter with such minuteness that Quintilian thinks they have multiplied figures to excess. The author of Homer's life, which some ascribe to Plutarch, has shown that

there is scarcely a figure mentioned by rhetoricians but is to be met with in that most ancient poet. And, from the nature of speech, we may easily perceive that mankind must have very early introduced tropes to supply the want of proper words to express their simple ideas; and the like necessity must have put them upon the use of figures to represent their passions. When the mind is disturbed, we show it by our words as well as by our countenances and actions. Hence some have styled figures the language of the passions. And Cicero calls them 'the principal weapons of an orator.' His oration against Catiline, when he had just discovered his plot to destroy the Roman state and burn the city, affords a grand specimen of the strongest and most moving figures. And the discourse had its desired effect; for, when Catiline stood up to make his defence, the whole senate were so inflamed by what Cicero had said, that they had not patience to hear him speak; upon which he immediately left the city. Of a different description, but equally excellent, are those of Virgil, when Dido finds that Æneas is about to leave her, and using all her arts to detain him, she discovers her fear, anger, and revenge, with the whole crowd of passions which possessed her mind.

Figures should always be accommodated to the sentiments, and rise in proportion to the images, designed to be conveyed by them: but where the language outstrips the thought, though it may please the ear, yet an intelligent hearer will soon feel the impropriety. In the use of pathetic figures, it is generally better to be nervous than copious, that the images, by their closer union, may impress the mind with greater energy. All figures should be so interwoven in a discourse as not to render the style rough and uneven, sometimes high, and at other times low. In a word, they should rather seem to arise from nature than art.

Figures are divided into figures of words, and figures of sentences. The difference consists in this; that in the former, if we alter the words, or even the situation of them, we destroy the figure; but in the latter the figure remains, whatever words are used, or in whatever manner the order of them is changed. Thus, when the name of a person or thing is repeated, to intimate some known property or quality thereof, it is a verbal figure called *place*. Cicero was a true patriot; and therefore we say that at the time of Catiline's conspiracy, Cicero appeared like Cicero. The sense would remain the same, but the figure would be lost, if we should say, at that time Cicero appeared like himself. So when two or more sentences, or members of a sentence, end with the same word, it is called *epistrophe*; as when we say, to lose all relish of life is in effect to lose life. But if the order of the words be changed in the latter clause, thus, to lose all relish of life, is to lose life in effect; the figure vanishes. Such is the nature of the verbal figures. But it is not so in figures of sentences; they continue the same, whatever alterations are made in the words.

I. *Verbal figures* may be distinguished into three sorts, as they consist in a deficiency, a redundancy, or a repetition, of words.

Of the first sort are *ellipsis* and *asindeton*. 1. *Ellipsis* is when one or more words are wanting in a sentence, to complete the construction, and fully express the sense. This figure is often used in proverbial expressions: as when we say, Many men, many minds; i. e. have many minds; and, the more danger, the more honor; i. e. gains more honor. But where more is intended by such expressions than mere brevity, and especially when they are the effect of some passion, the figure is called *aposiopesis*. 2. *Asyndeton* is when the particles that connect the members of a sentence are left out, to represent either the celerity of an action, or the haste and eagerness of the speaker. Thus Cæsar expresses his speedy conquest of Pharnaces: I came, I saw, I conquered. If he had inserted the copulatives, and said, I came, and I saw, and I conquered, it would have retarded the communication of his ideas, and not given so just an idea of the swiftness of the action. We took notice, in a preceding section, of the vehement and impetuous manner in which Cicero attacked Catiline in his first oration, where his design was to fire the minds of the senate against him, and oblige him to leave the city. The next day, when Catiline was gone, he calls together the citizens, and in a sort of rapture thus begins, he is gone, departed, escaped, broke out; intimating both the excessive rage in which Catiline left Rome, and the great pleasure with which he was himself affected on that account. This concise way of speaking adds likewise a great emphasis to an expression, and affects the mind with great force.

ii. The second sort of verbal figures is contrary to these, and consists in a redundancy or multiplicity of words; which are likewise two, *pleonasmus* and *polysyndeton*. 1. When we use more words than are necessary to express a thing it is called *pleonasmus*. This is done sometimes for greater emphasis, as when we say, Where in the world is he? At other times it is designed to ascertain the truth of what is said: so the servant in Terence, when the truth of what he had related was called in question, replies, It is certainly so; I saw it with these eyes. 2. When the several parts of a sentence are united by proper particles it is called *polysyndeton*. This adds a weight and gravity to an expression, and, by retarding the course of the sentence, gives the mind time to reflect upon every part distinctly. We often meet with this figure in Demosthenes. Thus he encourages the Athenians to prosecute the war against Philip II. from this consideration, that now 'they had ships, and men, and money, and stores, and all other things which might contribute to the strength of the city, in greater number and plenty than in former times.' Every article here has its weight; but, if we remove the copulatives, the sentence will lose much of its force.

iii. The third kind of verbal figures consists in a repetition. Either the same word in sound or sense, is repeated; or one of a like sound or signification, or both. Of the former sort there are ten, called *antanaclasis*, *place*, *epizeuxis*, *climax*, *anaphora*, *epistrophe*, *symploce*, *epanalepsis*, *anadiplosis*, and *epanodos*. The two first of these agree in sound, but differ in sense; the eight following agree in both.

1. When the same word in sound, but not in sense, is repeated, it is called *antanaclasis*. This figure sometimes carries a poignancy in it; and, when it appears natural and easy, discovers a ready turn of thought. As when a son, to clear himself of suspicion, assured his father, He did not wait for his death; his father replied, But I desire you would wait for it. Here the word wait is taken in two different senses. And our Saviour uses this figure, when he says to one of his disciples, who desired to go and bury his father, Follow me, and let the dead bury their dead. Where dead in the one place denotes a natural death, and in the other a moral or spiritual death.

2. Sometimes the name of some person or thing is repeated, to denote some particular character or property; and then it is called *plocé*. Thus Cicero says, Young Cato wants experience, but yet he is Cato; meaning he had the steady temper of the family.

3. When a word is repeated with vehemence in the same sense, it is called *episeuris*. This figure shows the earnestness of the speaker, and his great anxiety about what he says; and therefore has a natural tendency to excite attention. It is suited to express anger, surprise, sorrow, and several other passions. As when Cicero would express his indignation against Anthony, for having been the chief instrument in bringing on the civil war, he says to him: You, you Anthony, pushed Cæsar upon the civil war. Or when our Saviour would express his great concern for the wickedness of the Jews, he exclaims, O Jerusalem, Jerusalem, who killest the prophets!

4. *Climax* is a beautiful kind of repetition, when the word, which ends the first member of a period begins the second, and so through each member, till the whole is finished. There is a great deal of strength as well as beauty in this figure, where the several steps rise naturally, and are closely connected. As in this example:—There is no enjoyment of property without government, no government without a magistrate, no magistrate without obedience, and no obedience where every one acts as he pleases. But, as Quintilian observes, this figure is apt to look too much like art; for which reason he advises not to use it often.

5. When several sentences, or members of a sentence, begin with the same word, it is called *anaphora*. This is a lively and elegant figure, and serves very much to engage attention: for, by the frequent return of the same word, the mind of the hearer is held in an agreeable suspense, till the whole is finished. ‘You do nothing,’ says Cicero to Catiline, ‘you attempt nothing, you think nothing, but what I not only hear, but also see and plainly perceive.’ It is frequently used by way of question; which renders it not only beautiful, but strong and nervous. As at the beginning of the same speech: ‘Does neither the night-guard of the palace, nor the city-watch, nor the people’s fear, nor the agreement of all good men, nor the meeting of the senate in this fortified place, nor the countenances and looks of this society, at all move you?’

6. *Epistrophe* is contrary to the former, and makes the repetition at the end of each member

or sentence. As thus:—Since concord was lost, friendship was lost, fidelity was lost, liberty was lost; all was lost.

7. *Symploce* takes in both these last figures. As in that of Cicero:—‘You would pardon and acquit him whom the senate have condemned, whom the people of Rome have condemned, whom all mankind have condemned.’ Here the several members both begin and end with the same word.

8. When a sentence concludes with the word with which it began, it is called *epanalepsis*. As in that expression of Plautus:—‘Virtue contains all things; he wants no good thing who has virtue.’ This figure adds force to an expression, when the principal thing designed to be conveyed is thus repeated, by leaving it last upon the mind. And it heightens the beauty, when the sentence has an agreeable turn arising from two opposite parts.

9. When the next sentence begins with the same word with which the first concluded, it is termed *anadiplosis*. As in the following instance: Let us think no price too great for truth; truth cannot be bought too dear. This figure generally suits best with solemn discourses.

10. *Epanodos* is the inversion of a sentence, or repeating it backwards, so that it takes in the two last figures; for it both begins and ends with the same word, and the same word is likewise repeated in the middle. It serves to illustrate and enforce the sense, by setting it in two opposite views. As in that expression of the prophet:—‘Wo unto them who call good evil, and evil good; who put darkness for light, and light for darkness!’ &c.

II. Those figures which consist in a repetition of words of a like sound or signification, or both, are four: *paronomasia*, *homoioputon*, *synonymia*, and *derivatio*; the two first of which respect words that are similar in sound only, the third in sense, and the last in both.

i. When two words very near in sound, but different in sense, respect each other in the same sentence, it is called *paronomasia*. As when we say, After a feast comes a fast; and, A friend in need is a friend indeed. We usually call it a pun, which, when new, and appositely used, passes for wit, and serves to enliven conversation. Nor is it wholly to be excluded from grave and serious discourses; for a witty jest has sometimes had a better effect than a solid argument, and prevailed with those who could not be moved by close reasoning. And therefore Cicero and the best speakers have sometimes recourse to it.

ii. When the several parts of a sentence end with the same case, or tense of a like sound, this is the figure named *homoioputon*. As thus:—No marvel though wisdom complain that she is either wilfully despised, or carelessly neglected; either openly scorned, or secretly abhorred. This figure is esteemed most beautiful when the parts are all or nearly of the same length; as it adds to the harmony of the period, and renders the cadence of the several members more musical. The Greek rhetoricians were much addicted to it, particularly Isocrates; but some of the best orators avoided it, as having too much the appearance of art.

iii. The next figure is *synonymia*. Strictly

speaking, synonymous words are those which have exactly the same sense; but, there being few such, the term is extended to comprehend words of a near affinity in their signification, which in discourse are frequently put for one another. So, to desire, and entreat, are used as equivalent terms; and esteem and honor are often taken for synonymous words, though they clearly have not the same sense. When two or more such words come together they constitute this figure.

iv. When such words as spring from the same root, as justice, just, injustice, unjust, and the like, come together in the same sentence, they make the figure called *derivation*. This figure receives an additional beauty when repeated in two opposite members; as, He wished rather to die a present death than to live a miserable life.

II. *Figures of sentences*.—Of these some are principally adapted for reasoning, and others to move the passions.

i. Figures suited for proof, are six: *Prolepsis*, *hypobole*, *anacoinosis*, *epitrope*, *parabole*, and *antithesis*.

1. *Prolepsis*, or anticipation, is so called, when the orator first starts an objection, which he foresees may be made either against his conduct or cause, and then answers it. Its use is to prevent the exceptions of an adversary, which cannot afterwards be introduced with so good a grace; and it serves to conciliate the audience, while the speaker appears desirous to represent matters fairly, and not to conceal any objection which may be made against him. The occasions of this figure are various; and Cicero's orations abound with examples, as well as those of our best speakers in parliament.

2. *Hypobole*, or subjection, is similar; when several things are mentioned that seem to make for the contrary side, and each of them refuted in order. It consists of three parts, when complete; a proposition, an enumeration of particulars with their answers, and a conclusion.

3. *Anacoinosis*, or communication; by which the speaker deliberates or expostulates either with the judges, the hearers, or the adversary. Cicero uses it in addressing the judges against Verres; and the sacred writers sometimes introduce God himself thus expostulating with mankind. See Malachi i. 6.

4. *Epitrope*, or concession, grants one thing, to obtain another more advantageous. It is either real or feigned; and either the whole of a thing, or a part only, is granted. Nothing more confounds an adversary than to grant him his whole argument, and at the same time either to show that it is nothing to the purpose, or to offer something else to invalidate it. Thus Cicero, in his defence of Milo, represents the taking off Clodius, with which Milo was accused, as a glorious action; after he has shown that Milo's servants did it without his knowledge.

5. *Parabole*, or similitude, illustrates a thing by comparing it with some other to which it bears a resemblance. Similitudes are indeed but weak arguments, but where the design is not so much to prove what is doubtful as to set things in a clear and agreeable light, they are very proper figures.

6. *Antithesis* is a contrast or opposition, by which things contrary or different are compared, to render them more evident. Thus Cicero says, 'the Roman people hate private luxury, but love public grandeur.' This is a very florid figure; and suited no less for amplification than proof. It is esteemed a beauty in this figure when any of the members are inverted, which some call *antimetathesis*. As where Cicero opposes the conduct of Verres, when governor of Sicily, to that of Marcellus who took Syracuse the capital of that island. To this figure may also be referred *oxymoron*, or *seeming contradiction*; that is, when the parts of a sentence disagree in sound, but are consistent in sense. As when Ovid says of Althea, that she was impiously pious. And so Cato used to say of Scipio Africanus, that 'he was never less at leisure, than when he was at leisure; nor less alone than when alone.' Dr. Blair observes, 'contrast has always this effect, to make each of the contrasted objects appear in the stronger light. White, for instance, never appears so bright as when it is opposed to black, and when both are viewed together. Antithesis therefore may, on many occasions, be employed to advantage, to strengthen the impression which we intend that any object should make. To render an antithesis more complete, it is always of advantage that the words and members of the sentence expressing the contrasted objects be similarly constructed, and made to correspond to each other. At the same time, the frequent use of antithesis, especially where the opposition in the words is nice and quaint, is apt to render the style disagreeable. A maxim or moral saying properly enough receives this form; but where a string of such sentences succeed each other, where this becomes an author's favorite and prevailing manner of expressing himself, his style is faulty; and upon this account Seneca has been often and justly censured.' There is another kind of antithesis, which consists in surprising us by the unexpected contrasts of things which it brings together; but it is wholly beneath the dignity of an orator, and is fit only for pieces of humor, calculated to excite ridicule.

ii. Figures suited to move the passions, are

1. *Epanorthosis*, or *correction*, by which the speaker either recalls or amends what he had last said. Sometimes one or more words are recalled, and others substituted in their room; at other times, without recalling what has been said, something else is substituted as more suitable. Cicero, in his defence of Milo, speaking to the judges concerning Clodius, says, 'are you only ignorant what laws, if they may be called laws, and not rather torches and plagues of the state, he was about to impose and force upon us?' Sometimes the correction is made by substituting something contrary to what had been said before; 'Cæsar,' says Cicero, 'when Antony was most enraged, and we dreaded his cruel return, raised a very powerful army of invincible veterans; to effect which he threw away his whole estate. Though I have used an improper word; he did not throw it away, but employed it for the safety of the government.'

2. *Paralepsis*, or *omission*, is a figure, when

the speaker pretends to omit, or pass by, what at the same times he declares. It is used either in praise or dispraise. Thus Cicero, in his defence of Sextius; 'I might say many things of his liberality, kindness to his domestics, his command in the army, and moderation during his office in the province; but the honor of the state presents itself to my view; and calling me to it, advises me to omit these lesser matters.' There is a beautiful instance of this figure in St. Paul's epistle to Philemon, ver. 19. Hermogenes observes that this figure is principally used on three occasions: either when things are small, but yet necessary to be mentioned; or well known, and need not be enlarged on; or ungrateful, and therefore to be introduced with caution.

3. *Parrhesia*, or *reprehension*. The orator sometimes prepares his hearers for this by commending them first, urging the necessity of it, representing his great concern for them as his motive, or joining himself with them. Thus Cicero charges the senate with the death of Servius Sulpicius, for sending him to Mark Antony under a very ill state of health. His design was to make them agree to a motion he was to make, that a statue and monument might be erected to his memory at the public expense. Sometimes the orator assumes an air of reproof, with a view only to pass a compliment with a better grace. As Cicero in his address to Cæsar, when he says, 'I hear that saying from you with concern, that you have lived long enough, either for the purposes of nature or glory: for nature perhaps, if you think so; and, if you please, for glory; but what is principally to be regarded, not for your country.'

4. *Aparithmesis*, or *enumeration*, is when that which might be expressed by a few words is branched out into several particulars. Cicero, in pleading for the Manilian law, where his design is to conciliate the esteem of the people to Pompey, thus enlarges upon his character: 'What can be said either worthy of him, or new to you, or which every one has not heard? For those are not the only virtues of a general which are commonly thought so; labor in affairs, courage in dangers, industry in acting, despatch in performing, design in contriving; which are greater in him than in all other generals we have ever seen or heard of.'

5. *Exergasia*, or *exposition*, has an affinity with the former figure; but differs in this, that it consists of several equivalent expressions, or nearly such, to represent the same thing in a stronger manner; whereas the other enlarges the idea by an enumeration of different particulars. So that this figure has a near relation to synonymia.

6. *Aporia*, or *doubt*, expresses the debate of the mind with itself upon a pressing difficulty. A person in such a state is apt to hesitate, or start several things successively, without coming to any fixed resolution. Of this kind is that of Cicero for Cluentius, when he says, 'I know not which way to turn myself. Shall I deny the scandal thrown upon him of bribing the judges? Can I say the people were not told of it? &c.' Orators sometimes begin their discourse with this figure. A diffidence of mind at first is not unbecoming, but graceful; it carries in it an air of modesty,

and tends very much to conciliate the affections of the hearers.

7. Sometimes a passion has that effect, not so much to render a person doubtful what to say, as to stop him in the midst of a sentence, and prevent his expressing the whole of what he designed; and then it is called *apostopesis*, or *concealment*. It denotes different passions; as anger, which, by its heat and vehemence, causes persons to break off abruptly in their discourse: and Cicero, in a letter to Cassius, uses it to express fear, when he says to him, 'Brutus could scarcely support himself at Mutina; if he is safe we have carried the day. But if—heaven avert the omen! all must have recourse to you.' His meaning is, 'If Brutus should be defeated.'

8. *Erotesis*, or *interrogation*. Every question is not figurative; but it becomes figurative, when the putting it by way of question gives it life and spirit. As when Cicero says, 'Catiline, how long will you abuse our patience? Do not you perceive your designs are discovered?' It serves also to press and bear down an adversary. Thus in his defence of Plancius: 'I will make you this offer, choose any tribe you please, and show by whom it was bribed; and if you cannot, as I believe you will not, I will prove how he gained it. Is this a fair contest? Will you engage on this foot? I cannot give you fairer play. Why are you silent? Why do you dissemble? Why do you hesitate? I insist upon it, urge you to it, press it, require, and even demand it of you.'

9. *Echphosis*, or *exclamation*, is a vehement extension of the voice, occasioned by a commotion of mind, naturally venting itself. This figure is used by Cicero to express a variety of passions.

10. *Epiphonema*, or *acclamation*, has a great affinity with the figure. It is so called, when the speaker, at the conclusion of his argument, makes some lively and just remark upon what he has been saying, to give it the greater force. It is not so impetuous as exclamation, being usually expressive of the milder and more gentle passions. When Cicero has shown that recourse is never to be had to force, but in cases of the utmost necessity, he adds, 'thus to think, is prudence; to act, fortitude; both to think and act, perfect and consummate virtue.'

11. *Apostrophe*, or *address*, is when the speaker breaks off from the series of his discourse, and addresses himself to some particular person present or absent, living or dead; or even to inanimate nature: thus he has an opportunity of saying many things with greater freedom than if immediately addressing the persons themselves. He can admonish, chide, or censure, without giving offence. Thus Cicero, in his defence of Milo, expressing his concern if he should not succeed in it, says, 'And how shall I answer it to you, my brother Quintus, the partner of my misfortunes, who art now absent?' An appeal to heaven, or any part of inanimate nature, has something very sublime and solemn in it, which we often meet with in sacred writ. So the divine prophet: 'Hear, O heavens! and give ear, O earth! for the Lord hath spoken.' And Jeremy: 'Be astonished, O ye heavens, at this.' See APOSTROPHE.

12. *Prosopopœia*, or the *fiction of a person*: by which either an absent person is introduced speaking; or one who is dead, as if he were alive and present; or speech is attributed to some inanimate being. There is no figure, perhaps, which serves better purposes to an orator than this. For by it he is enabled to call in all nature to his assistance. There is scarcely any thing fit to be said, but may be introduced this way. When he has severe things to say, and which may give offence as coming from himself, he avoids this by putting them into the mouth of some other person, from whom they will be better taken; or makes inanimate nature bring a charge, or express a resentment, to render it the more affecting: and by the same method he sometimes secures himself from a charge of flattery, in carrying a compliment too high. Cicero, in his oration for Balbus, introduces Marius, who was dead, to plead in his defence: 'Can Balbus,' says he, 'be condemned, without condemning Marius for a like fact? Let him be present to your thoughts, since he cannot be so in person. Let him tell you, he was not unacquainted with leagues, void of examples, or ignorant of war.' And again, in his first invective against Catiline, he represents his country as expostulating with himself, and upbraiding him for suffering such a criminal as Catiline to live. In the management of this figure, care should be taken that what is said be always consistent with the character introduced.

In treating upon figures, we have hitherto considered them separately; but some expressions consist of a complication of them, and may come under the denomination of several figures, as well verbal as those of sentences, differently considered. Examples of this the judicious reader will easily discover, both in ancient and modern orations.

IV. *Of style, and its different characters.*—The word style properly signifies the instrument which the ancients used in writing. For as they commonly wrote upon thin boards covered over with wax, and sometimes upon the barks of trees, they made use of a long instrument like a bodkin, pointed at one end, with which they cut their letters, and broad at the other, to erase any thing they chose to alter. This the Latins called *stylus*. But, though this be the first sense of the word, yet afterwards it came to denote the manner of expression. In this sense we likewise use it, by the same kind of trope that we call any one's writing his hand. Style, then, in the common acceptation of the word, is the peculiar manner in which a man expresses his conceptions by means of language. The reasons which occasion a variety of style, we cannot here discuss.

The foundation of a good style is good sense. Cicero recommends to all who are candidates for eloquence, and desirous to become masters of a good style, to write much. This affords them an opportunity to digest their thoughts, and weigh their words and expressions so as to give every thing its proper force and evidence: while, by reviewing a discourse composed, we correct its errors or supply its defects.

Different countries have not only a different

language, but a peculiarity of style. The eastern nations, for instance, had a lofty and majestic manner of speaking. Their words are full and sonorous, their expressions strong and forcible, and warmed with the most lively and moving figures. This is evident from the writings of the Old Testament, in which we find a most agreeable mixture of simplicity and dignity. On the contrary, the style of the more northern languages generally partakes of their climate: 'There is,' says Mr. Addison, 'a certain coldness and indifference in the phrases of our European languages, compared with the oriental forms of speech. And it happens very luckily, that the Hebrew idioms run into the English tongue with a peculiar grace and beauty. Our language has received innumerable elegancies and improvements from that infusion of Hebraisms, which are derived to it out of the poetical passages in holy writ. They give a force and energy to our expressions, warm and animate our language, and convey our thoughts in more ardent and intense phrases, than any that are to be met with in our own tongue. There is something so pathetic in this kind of diction that it often sets the mind in a flame, and makes our hearts burn within us.' Spect. No. 405.

The style of the same nation has been found also to vary with the great events of its history and the prevailing manners. The Athenians, while they continued a free state, were an active, industrious and frugal people; and cultivated the arts and sciences beyond any other nation: but as they had powerful enemies, and were exceedingly jealous of their liberties, this preserved them from luxury. Their style was at this time agreeable to their conduct; accurate and close, but very expressive. The Asiatics, on the other hand, were more gay and loose in their manners, devoted to luxury and pleasure; and accordingly they affected a florid and swelling style, filled with redundancies and superfluities of expression. The Rhodian style was a medium between these two; neither so concise and expressive as the Attic, nor so loose and redundant as the Asiatic. Quintilian says it had a mixture of its author, and the humor of the people; and, like plants set in a foreign soil, degenerated from the Attic purity, but not so wholly as to lose it. They first received it from Æschines, who, being worsted in his famous contest with Demosthenes, retired thither, and taught them rhetoric.

Cicero tells us that the first Latin historians aimed at nothing more than barely to make themselves intelligible, with as much brevity as possible. Those who succeeded them advanced a step further; and gave a better turn and cadence to their sentences, though still without ornament. But afterwards, when the Greek language became fashionable at Rome, by copying after Herodotus, Thucydides, Xenophon, and others, they gradually introduced all their beauties into their own tongue, which in Cicero's time was brought to its highest perfection. But it did not long continue in that state. A degeneracy of manners soon corrupted their language, which Quintilian very much regrets. The case was the same with respect to the Greek tongue; though its purity continued much longer than that of the

Latin. Nor can any language be exempt from the common fate of all human productions; which have their beginning, perfection, and decay. Besides, there is a sort of fashion even in language. Cicero tells us that the most ancient Greek orators whose writings were extant in his time, such as Pericles, Alcibiades, and others, were subtle, acute, concise, and abounded in sense rather than words. But another class that followed them, among whom were Critias, Theamenes, and Lysias, retained the good sense of the former, while they improved their style. After these came Isocrates, who added all the flowers and beauties of eloquence: and, as he had many followers, they applied these ornaments and decorations according to their different tastes; some by pomp and splendor, and others by greater force and energy. In this last way Demosthenes principally excelled. Afterwards they sunk into a softer and smoother manner, not less exact and florid, but more cold and lifeless.

But the chief distinction of style arises from the different subjects of discourse. The same way of speaking no more suits all subjects than the same garment would all persons and all ranks. The style, therefore, should always be adapted to the subject, which rhetoricians have reduced to three ranks: viz. the low or plain style, the middle or temperate, and the lofty or sublime: which are likewise called characters, because they denote the quality of the subject upon which they treat. This division of style into three characters was taken notice of very early by ancient writers. Some observe it even in Homer, who assigns the sublime to Ulysses, when he represents him so copious and vehement an orator that his words came from him like winter snow; while he describes Menelaus as a polite speaker, but concise and moderate; and represents Nestor's manner as between these two, not so high as the one, nor so low as the other; but smooth, even, and pleasant, or, as he expresses it, more sweet than honey. Quintilian observes that, although accuracy and politeness were general characters of the Attic writers, yet among their orators, Lysias excelled in a low and familiar style; Isocrates in elegance, smoothness, and the fine turn of his periods; and Demosthenes in fire and rapidity, by which he carried all before him. Gellius tells us that the like difference was found in the three philosophers who were sent from the Athenians to Rome (before the Romans had any relish for the polite arts) to solicit the remittance of a fine laid upon them. Carneades was vehement and rapid in his harangues; Critolaus neat and smooth; and Diogenes modest and sober. The eloquence of these orators, and the agreeable variety of their manner, so captivated the Roman youth, and inflamed them with such a love of the Grecian arts, that old Cato, who did all he could to check it by hurrying away the ambassadors, could not prevent their vigorous pursuit of them, till the study became in a manner universal. And the old philosopher himself afterwards learned the Greek language, when it became more fashionable; which lord Bacon styles a punishment upon him for his former crime. It seldom happens that the same

person excels in each of these characters. They seem to require a different genius, and most orators are naturally led to one of them more than another; though all of them are requisite for an orator on different occasions. See *STYLE*.

V. *Of the style of an orator.*—The style of an orator must occasionally comprehend all the characters of low, middle, and sublime, as they are applied by him in the different parts of his province. For the language must be suited to the subject, and the different views of the speaker necessarily occasion a variety in the manner of expression. Now an orator has three objects in view; to prove what he asserts, to represent it in an agreeable light, and to move the passions. Each of these parts of his province requires a different style. The low style is most proper for proof and information; the middle style is best suited for pleasure and entertainment; but the sublime is necessary to influence the passions. Here the orator calls in all the assistance of nature and art; the most raised and lofty thoughts, clothed with the brightest and strongest coloring, enter into this character. As short periods are proper in the low style, so less care is necessary in their turn and cadency. But the words should be well chosen and proper, suited to the ideas they are designed to convey; the expressions plain and clear, and the artificial ornaments few and modest. Bold or lofty metaphors, or in which the allusion is dark and remote, ought to be avoided. Of these, such as come nearest to the natural way of expression are most proper for this style.

As the middle style is more adapted for pleasure and delight, it admits of all those beauties and ornaments which soothe and entertain the mind. It has more force and energy than the low style, but less than the sublime. Smooth and harmonious numbers, well-turned periods, of a just length, delightful cadence, and accurate disposition of the words, are suited to this style. The most beautiful and shining tropes, which strike the fancy, and all those figures which, by repetition, similitude, or proportion of sounds, please and gratify the ear, help to form this character.

But it is the sublime style which perfects the orator. This requires the most forcible and emphatical words, the boldest metaphors, and strongest figures. In verbal figures, repetitions, synonymes, gradations, contraries, with others of a like force and energy, are chiefly employed here. But figures of sentences are the most considerable, and principally contribute to make up this character. Among these are similes taken from lofty subjects, *protopopœia*, *apostrophe*, exclamation, *epiphonema*, *aposiopesis*, and others of a like nature. But due care must be taken of the form, construction, and harmony of the periods; which seem best disposed when long and short ones are intermixed. For, though round and swelling periods carry in them something grand and majestic, yet they often move too slow to strike the passions; whereas short ones are more acute and pungent, and, by returning quick, awaken the mind, and raise the passions. But, to render it complete, it must

be supported with strong reason, grandeur of thought, and sentiments every way equal to the expression; without which it will be liable to swell into bombast. Mr. Burke's admirable *Essay on the Sublime and Beautiful* has long been a standard work on this part of our subject.

PART IV.

OF PRONUNCIATION.

I. Of pronunciation in general.—Pronunciation is by some of the ancients called action: though, if we attend to the proper signification of these words, the former respects the voice, and the latter the gestures and motions of the body. But, if we consider them as synonymous, in this large sense pronunciation or action may be said to be a suitable conformity of the voice, and the several motions of the body, in speaking, to the subject matter of the discourse. The best judges among the ancients have represented this as the principal part of an orator's province, whence he is chiefly to expect success in the art of persuasion. When Cicero, in the person of Crassus, has largely and elegantly discoursed upon all the other parts of oratory, coming at last to speak of this, he says: 'All the former have their effect as they are pronounced. It is the action alone that governs in speaking; without which the best orator is of no value, and is often defeated by one, in other respects, much his inferior.' And he says that Demosthenes was of the same opinion, who, when he was asked what was the principal thing in oratory, replied action; and being asked again a second and a third time, what was next considerable, he still made the same answer; by which he intimated that the whole art did in a manner consist in it. And indeed, if he had not judged this highly necessary for an orator, he would scarcely have taken so much pains in correcting those natural defects under which he labored at first, in order to acquire it. See DEMOSTHENES. Nor was he less careful in endeavouring to gain the habit of a becoming and decent gesture; for which purpose he used, we are told, to pronounce his discourses alone before a large glass. Quintilian says that 'it is not of so much moment what our compositions are, as how they are pronounced; since it is the manner of the delivery by which the audience is moved.' And he therefore asserts that 'an indifferent discourse, assisted by a lively and graceful action, will have greater efficacy than the finest harangue, which wants that advantage.'

The truth of this sentiment of the ancients might be proved from many instances. Hortensius, a contemporary with Cicero, and, while living, next to him in reputation as an orator, was highly applauded for his action. But his orations after his death, as Quintilian tells us (for there are none extant), did not appear answerable to his character. But Cicero himself is a decisive instance. After the death of Pompey, when Cæsar had usurped the government, many of his acquaintance interceded with him in behalf of their relations and friends, who had been of the contrary party in the late wars.

Among others, Cicero solicited for his friend Ligarius; which Tubero, understanding, who owed Ligarius a grudge, he opposed it, and undertook to represent him to Cæsar as unworthy of his mercy. Cæsar himself was prejudiced against Ligarius; and therefore, when the cause was to come before him, he said, 'we may venture to hear Cicero display his eloquence; for I know the person he pleads for to be an ill man, and my enemy.' But, in the course of his oration, Cicero so worked upon his passions, that, by the frequent alteration of his countenance, the emotions of his mind were very conspicuous. And when he came to touch upon the battle of Pharsalia, which had given Cæsar the empire of the world, he represented it in that moving and lively manner that Cæsar could no longer contain himself, but was thrown into such a fit of shivering that he dropped the papers which he held in his hand. This was the more remarkable, because Cæsar was himself one of the greatest orators of that age, knew all the arts of address, and consequently was better prepared to guard against them. But neither his skill nor resolution was of sufficient force against the power of oratory; the conqueror of the world became a conquest to the charms of Cicero's eloquence; so that, contrary to his intention, he pardoned Ligarius. This oration is still extant; but can scarcely be thought, in reading it, to have had so surprising an effect; which must therefore have been chiefly owing to the wonderful manner of the speaker.

The more natural the pronunciation is, it will be the more moving. The ancients, therefore, make it one qualification of an orator, that he be a good man; because a person of this character will make the cause he espouses his own, and the more sensibly he is touched with it himself, his action will be the more natural. Cicero says, 'it is certain that truth in every thing excels imitation; but, if that was sufficient of itself in action, we should have no occasion for art.' In his opinion, therefore, art, if well managed, will assist and improve nature. Sometimes the force of it is so great that, even where it is wholly counterfeit, it will work the effect of truth. This is well known to those who frequent the theatre. The warmth of expression and vehemency of action should rise in proportion to the importance of the subject and concern of the speaker. The learned author of *Dialogues on Eloquence*, p. 92, says, 'the Romans had a very great talent this way, and the Greeks a greater. The eastern nations excelled in it, and particularly the Hebrews. Nothing can equal the strength and vivacity of the figures they employed in their discourse; and the actions they used to express their sentiments, such as putting ashes on their heads, tearing their garments, and covering themselves with sackcloth under any deep distress and sorrow of mind.' As action, therefore, was judged so necessary a qualification in an orator among the ancients, so they made use of several methods and expedients for the better attaining it. Quintilian gives directions how young persons should be taught to pronounce, when they first learn to read. The ancients likewise had persons whom they

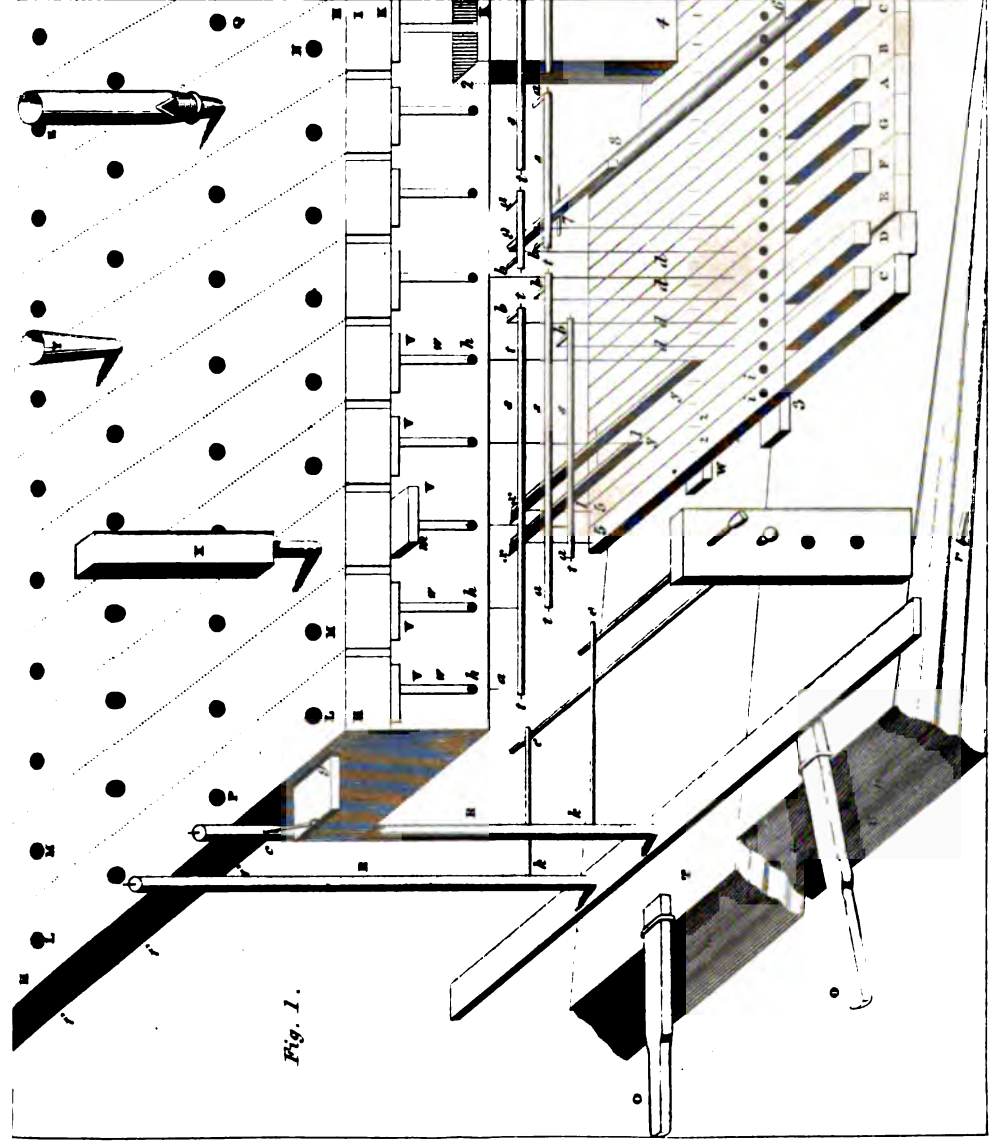

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

called *phonæsti*, whose proper business was to teach them how to regulate their voice; and others who instructed them in the whole art of pronunciation, both as to their voice and gestures. These last were generally taken from the theatre, being eminent experienced actors.

But Cicero well represents the distinction between the action of an orator and that of an actor. 'The action of the body,' he says, 'ought to be suited to the expressions, not in a theatrical way, mimicking the words by particular gesticulations, but in a manner expressive of the general sense, with a sedate and manly inflection; not taken from the stage and actors, but from the exercise of arms and the palestra.' 'Every gesture and motion of the comedians,' says Quintilian, 'is not to be imitated, nor to the same degree.' When thus prepared, they were sent to the schools of the rhetoricians, to cultivate their style, and acquire the whole art of eloquence; particularly a just and accurate pronunciation. And, as the Greeks were most celebrated for their skill in oratory, the Roman gentry and nobility generally sent their sons abroad, under the tuition of some Grecian master. Thus Cicero was sent to Rhodes under the famous Molo, and Brutus under Pammenes; Cæsar was going to the same place when taken by pirates; and Augustus afterwards studied there under Apollodorus. After this pains and industry, the ancients did not think themselves sufficiently qualified to take upon them the character of orators, till they got together their friends, and declaimed before them in private; which gave them an opportunity to correct any defects at first, before they became habitual.

II. *Of the Voice.*—The influence of sounds, either to raise or allay our passions, is evident from music: and certainly the harmony of a fine well pronounced discourse is as capable of moving us. As persons are differently affected when they speak; so they naturally alter the tone of their voice. It rises, sinks, and has various inflections, according to the state and disposition of the mind. When the mind is calm and sedate the voice is moderate and even; when the former is dejected with sorrow the latter is languid; and, when that is enflamed by passion, this is raised and elevated. It is the orator's business, therefore, to endeavour that the tone of his voice appear natural and unaffected. For this end, he must suit it to the nature of the subject. Some deliver a discourse in a low drawling manner; others hurry on in so loud and boisterous a tone, as if they imagined their hearers were deaf. But all the harmony of speech lies in the proper temperament of the voice between these extremes. The principal properties of voice may be referred either to quantity or quality.

1. *The quantity* of the voice consists in its highness or lowness, swiftness or slowness, and the intermediate degrees between them.

i. Every person who speaks in public should endeavour to fill the place where he speaks. But still he ought to be careful not to exceed the natural key of his voice. If he does, it will neither be soft nor agreeable; but either harsh and rough, or too shrill and squeaking. Besides, he will not be able to give every syllable its full and

distinct sound; which will render what he says obscure.

ii. The like caution is to be used against the contrary extreme, that the voice be not dropped, and suffered to sink too low. This will give the speaker pain in raising it again to its proper pitch, and be no less offensive to the hearers. The medium is a moderate and even voice. But this is not the same in all; that which is moderate in one would be high in another. Every person therefore must regulate it by the natural key of his voice. A calm and sedate tone is generally best; as a moderate and distinct sound is most pleasing to the ear. But this equality of the voice must also be accompanied with variety. Nothing is less pleasing than a discourse pronounced throughout in one continued monotony. The gradations, whether higher or lower, should be gentle and regular; an even tone of voice being best fitted to keep up attention. But the voice ought to agree with the style; and as the orator's province is not only to apply to the mind, but likewise to the passions, these require a great variety of the voice, high or low, vehement or languid, according to the nature of the passion he designs to affect.

iii. That some addresses ought to be pronounced faster than others is manifest. Gay and sprightly ideas should not only be expressed louder, but also faster, than such as are sad and melancholy. And, when we press an adversary, the voice should be brisk and quick. A precipitant and hasty pronunciation, however, is culpable, as well as speaking too slow. This argues a heaviness in the speaker; and, as he appears cool himself, he can never expect to warm his hearers. In long periods, the voice should be favored by beginning low and sedately, that it may hold to the end without respiration; or, if not, the breath ought to be recovered without sinking the voice. For, if once the voice drop for want of breath before the period be finished, not only the beauty but the sense will be injured. Quintilian lays a great stress upon a due attention to these pauses; and says, 'Though it may appear not so considerable in itself, yet all the other virtues of a good pronunciation are deficient without it.'

2. The chief *qualities* of the voice are strength, clearness, fullness, and smoothness; and various defects of the voice may be helped by care and attention. Temperance is a great preservative of the voice, and all excess is prejudicial to it. The voice must suffer, if the organs of speech have not their proper tone.

i. A strong voice is serviceable to an orator, but he who has a weak one should be careful not to strain it. He ought to begin low, and rise gradually to such a pitch as the key of his voice will easily carry him, without being obliged to sink afterwards. Frequent inflections of the voice will be some assistance to him. But he should take care to speak deliberately, and ease his voice, by allowing due time for respiration at all the pauses. It is an extreme much less inconvenient for such a person to speak too slow than too fast. But this defect of a weak voice is often capable of being helped by proper methods; as is evident from the instance of Demosthenes.

ii. A voice is said to be clear when the organs of speech are suited to give every single letter, and all the combinations of them in syllables and words, their proper and distinct sound. Such a tone of voice is very agreeable to the hearers; and no less so to the speaker, as it saves him a great expense of spirits. For a moderate voice, if clear, will be as distinctly heard as one much louder, if obscure. This is a great advantage to the speaker, because he can better help his voice under command, and modulate it at pleasure. An obscure and confused voice is not always occasioned by a deficiency in the organ; but is often the effect of a bad habit. Some, either from want of due care at first, or from inadvertency and negligence afterwards, run into a very irregular and confused manner of expressing their words; either by misplacing the accent, confounding the sound of the letters, or huddling the syllables one upon another, so as to render what they say often unintelligible.

iii. A full voice fills the ear, but it is often not pleasant. And therefore, to render it so, it should be frequently varied. Yet it seems better suited to the character of an orator than a small and shrill voice; because it has something in it more manly. Those who have the misfortune of a very small voice, should be cautious of raising it to too high a pitch, especially at once; because the sudden compressure of the organ is apt to occasion a squeaking and disagreeable sound.

iv. A soft and smooth voice is the most musical, especially if it be flexible.

III. *Of gesture.*—By *gesture* is meant a suitable conformity of the motions of the countenance and several parts of the body in speaking. It is not agreed among the learned, whether voice or gesture has the greater influence in oratory. But, as the latter affects us by the eye as the former does by the ear, gesture seems to have this advantage, that it conveys the impression more speedily to the mind. Nor is its influence less upon our passions; nay, in some instances, it appears to act more powerfully. A cast of the eye shall express desire in as moving a manner as the softest language; and a different motion of it resentment. Nor is it in some respects less various and expressive than language. Cicero tells us, he often diverted himself by trying this with Roscius the comedian; who could express a sentence as many ways by his gestures, as he himself by words. And some dramas, called pantomimes, are carried on wholly by mutes, who perform every part by gestures only, in a way very intelligent, as well as entertaining to the spectators. Well, therefore, might Cicero call action (or gesture) the language of the body, since it is capable in so lively a manner to express both our ideas and passions. But, with respect to oratory, gesture may be very properly called the second part of pronunciation; in which, as the voice should be suited to the impressions it receives from the mind, so the several motions of the body ought to be accommodated to various tones and inflections of the voice. When the voice is even and moderate, little gesture is required; and nothing is more unnatural than violent motion, in discoursing upon ordinary and familiar subjects. The motions of the

body should rise, therefore, in proportion to the vehemence and energy of the expression, as the natural and genuine effect of it.

It is hardly necessary to mention that, by the uniform practice of all nations, the most proper gesture for a public speaker is to address his audience standing. But though standing appears to be the most proper posture, yet it is very unbecoming for the body to be entirely without motion. It should not long continue in the same position, but be constantly changing imperceptibly. There ought to be no appearance of stiffness, but a certain ease and pliancy, suiting every expression; by which means, when a greater degree of motion is necessary, it will appear less sudden and vehement; for as the raising, sinking, and various inflections of the voice must be gradual, so likewise should the motions of the body. It is only on some particular occasions that a hasty impetuosity is proper in either case.

The head, in calm and sedate discourse, ought to keep its natural state, an upright posture. However, it should not be long without motion, but gently turn, sometimes on one side, and sometimes on the other, as occasion requires. It should always accompany the other actions of the body, and turn on the same side with them; except when aversion to any thing is expressed, which is effectually done by stretching out the right hand, and turning the head to the left. But it is the countenance that chiefly represents both the passions and disposition of the mind. By this we supplicate, threaten, soothe, invite, forbid, consent, or refuse, without speaking, the several parts of the face bearing their part, and contributing to the proper and decent motion of the whole. In a calm and sedate discourse, all the features retain their natural appearance. In sorrow, the forehead and eyebrows lour, and the cheeks hang down. But, in joy and cheerfulness, the forehead and eyebrows are expanded, the cheeks contracted, and the corners of the mouth drawn upwards. Anger and resentment contract the forehead, draw the brows together, and thrust out the lips; and terror elevates both the brows and the forehead.

Cicero advises that the greatest care should be taken in the management of the eye. We readily guess at a person's intention by observation of this member; any sudden change or emotion of the mind being presently followed by an alteration in the look. In speaking, therefore, upon pleasant and delightful subjects, the eyes are brisk and cheerful; as, on the contrary, they sink and are languid in delivering any thing melancholy. A gentle and moderate motion of the eyes is in an orator most suitable, directed occasionally to all parts of his audience, and gradually turning from side to side with an air of respect and modesty. The shoulders ought not to be elevated; as it contracts the neck, and hinders the proper motion of the head. Nor, on the other hand, should they be drawn down and depressed, as this occasions a stiffness both on the neck and the whole body. Their natural posture is most easy and graceful. A continued motion of the arms any way, is to be avoided. Their action should generally be very moderate, and follow that of the hands.

Quintilian seems to think the hands as necessary and powerful in action, as Cicero the eyes. 'The hands,' says he, 'without which all gesture is lame and weak, have a greater variety of motions than can well be expressed; for they are almost equal to our words. In short he styles them 'the common language of all mankind.' In admiration, and addresses to heaven, they must be elevated, but never raised above the eyes: in speaking of things below us, they are directed downwards. Side motions should generally begin from the left, and terminate gently on the right. In demonstrating, addressing, and on several other occasions, they are moved forward; and in threatening sometimes thrown back. But, when the orator speaks of himself, his right hand should be gently laid on his breast. When no other motion is necessary, the hands should be kept about as high as the breast. This is not only a graceful, but likewise the most easy posture, and gives the least strain to the muscles. They should never be suffered to hang down, or loll upon a cushion or bar. The left hand should never move alone, but accommodate itself to the motions of the right. In promises and expressions of compliment, the motions of the hands should be gentle and slow; but in exhortations and applause more swift. The hands should generally be open; but in expressions of compunction and anger they may be closed. All finical and trifling actions of the fingers ought to be avoided. The feet should continue steady, and not give the body a wavering and giddy motion by frequently shifting; though some persons fall into that habit without moving their feet. Philip, the Roman orator, was wont to tell his friends, 'he was never fit to talk, till he had warmed his arm.' He doubtless, therefore, used a more violent motion with his arms and hands than is common with us. And Cicero calls the arm projected the orator's weapon.

To speak low at first has the appearance of modesty, and is best for the voice: which, by rising gradually, will with more ease be carried to any pitch that may be afterwards necessary, without straining it. However, some variation of the voice is always proper to give it harmony. Sometimes it is not improper for an orator to set out with a considerable degree of warmth, expressed by such an elevation of the voice and gestures of the body as are suited to represent the emotions of his mind. But this is not ordinarily the case. We have some happy instances of it in Cicero; as in his oration for Roscius Amerinus, where the heinousness of the charge could not but excite his indignation against the accusers. And in that against Piso, and the two

first against Catiline, which begin in the same manner, from the resentment he had conceived and wished to inspire against their persons and conduct.

In narration the voice ought to be raised to a higher pitch. Facts should be stated distinctly and accurately, with a proper emphasis laid upon the principal circumstances. The proposition should be delivered with a clear and audible voice, and its divisions distinctly marked. The confirmation admits of a great variety, both of voice and gesture; and the reasoning ought to be accompanied with suitable actions. In confutation, the arguments of the opposite party should be stated plainly and distinctly, unless they appear unworthy of a serious answer; in which case they may be answered with humor, or exposed with ridicule. Tubero, having made it part of his charge against Ligarius that he was in Africa during the civil war between Cæsar and Pompey, Cicero, in his reply, said, 'Cæsar, my kinsman, Tubero has laid before you a new crime, and till this day unheard of, that Q. Ligarius was in Africa!' In a conclusion, both the voice and gesture should be brisk and sprightly, which may seem to arise from a sense of the speaker's opinion of the goodness of his cause, and that he has offered nothing but what is agreeable to reason and truth; as likewise from his assurance that the audience agree with him in the same sentiments. In every undertaking that requires care and thought persons are apt at first to be sedate and moderate, but when it is drawing to an end, and is nearly finished, it is very natural to appear more gay. If an enumeration of the principal arguments of the discourse be convenient, as it sometimes is, where they are pretty numerous, or the discourse is long, they ought to be expressed in the most clear and forcible manner.

Thus have we laid before our readers a brief but comprehensive view of the principles, rules, chief requisites, and practice of oratory. But, after all, it may be said of the orator as of a poet, 'nascitur non fit.' But the student of this science should consider his own genius. We seldom find that any actor can excel in all characters, but if he performs one well he is deficient in another; and therefore he commonly confines himself to such as best suit his powers. The case is the same with the orator, who should keep within those bounds which nature has prescribed. Every one should endeavour to know his own powers, and act in aid of them, as in most cases nature may be much assisted and improved by art.

ORATORY, a small closet or apartment near a bed-chamber, furnished for private devotions.

ORB, *n. s.*
ORBED, *adj.*
ORBICULAR,
ORBICULARLY, *adv.*
ORBICULATED, *adj.*
ORB'IT, *n. s.*
ORB'Y, *adj.*

Fr. and Ital. *orbe*;
Lat. *orbis*. A sphere;
globular or circular
body; hence the eye;
a wheel; circle; particularly a heavenly body
or light; circle or revolution of such a body; mundane circle; period;

evolution of time: orb'd and orbicular mean rounded, circular, or globular; as does the obsolete word orby: orbit is chiefly used for the line of a planet, path, or revolution; and by Young, improperly, as a diminutive of orb.

It smote Atreides' *orbis* target; but ranne not through the brasse. *Chapman.*

When now arraid
The world was with the spring; and *orbis* heures
Had gone the round againe, through herbs and
flowers. *Id.*

In the floor of heaven
There's not the smallest *orb* which thou beholdest,
But in his motion like an angel sings,
Still quiring to the young-eyed cherubims.

Shakespeare.

Will you again unknit
This churlish knot of all abhorred war,
And move in that obedient *orb* again,
Where you did give a fair and natural light? *Id.*

All those sayings will I overwear,
And all those swearings keep as true in soul,
As doth that *orb'd* continent the fire,
That severs day from night. *Id.*
Astronomers, to solve the phenomena, framed to
their conceit eccentricks and epicycles, and a won-
derful engine of *orbs*, though no such things were.

Bacon.

The *orbs*
Of his fierce chariot rolled as with the sound
Of torrent floods. *Milton's Paradise Lost.*
Self-begot, self-raised,
By our own quickening power, when fatal course
Had circled his full *orb*, the birth mature
Of this our native heaven. *Id.*

A drop serene hath quenched their *orbs*,
Or dim suffusion veiled. *Milton.*
Truth and justice then
Will down return to men,
Orbed in a rainbow, and like glories wearing. *Id.*

He shall monarchy with thee divide
Of all things, parted by the' empyreal bounds,
His quadrature from thy *orbicular* world. *Id.*
With smiling aspect you serenely move
In your fifth *orb*, and rule the realm of love.

Dryden.

They with a storm of darts to distance drive
The Trojan chief; who held at bay from far,
On his Vulcanian *orb* sustained the war. *Id.*
That fine part of our constitution, the eye, seems
as much the receptacle and seat of our passions, ap-
petites, and inclinations, as the mind itself. Love,
anger, pride, and avarice, all visibly move in those
little *orbs*.

Spectator.

A golden axle did the work uphold,
Gold was the beam, the wheels were *orb'd* with gold.

Addison.

The form of their bottom is not the same; for
whereas before it was of an *orbicular* make, they now
look as if they were pressed. *Id.*

By a circle I understand not here a perfect geomet-
rical circle, but an *orbicular* figure, whose length is
equal to its breadth, and which as to sense may
seem circular. *Newton.*

A mighty collection of water, inclosed in the
bowels of the earth, constitutes an huge *orb* in the
interior or central parts; upon the surface of which
orb of water the terrestrial strata are expanded.

Woodward's Natural History.

Suppose more suns in proper *orbits* rolled,
Dissolved the snows and chased the polar cold.

Blackmore.

Suppose the earth placed nearer to the sun, and
revolve for instance in the *orbit* of Mercury; there
the whole ocean would even boil with extremity of
heat, and be all exhaled into vapours; all plants and
animals would be scorched. *Bentley.*

Attend, and you discern it in the fair
Conduct and finger, or reclaim a hair;
Or roll the lucid *orbit* of an eye;
Or in full joy elaborate a sigh. *Young.*

Ancient dame, how wide and vast,
To a race like ours appears,
Rounded to an *orb* at last
All thy multitude of years! *Cowper*

Glorious *orb*! the idol
Of early nature and the vigorous race
Of undiseased mankind, the giant sons
Of the embrace of angels, with a sex
More beautiful than they, which did draw down
The erring spirits who can ne'er return. *Byron.*

ORB, in military tactics, is the position of a
number of men in the form of a hollow circle.
The celebrated marshal de Puysegur prefers this
position for a body of infantry in an open coun-
try to resist cavalry, or even a superior force of
infantry; because it is regular and equally
strong, and gives an enemy no reason to expect
better success by attacking one place than ano-
ther. Caesar drew his whole army in this form
when he fought against Labienus. The whole
army of the Gauls were formed into an orb,
under the command of Sabinus and Cotta, when
fighting against the Romans. This orb was
generally formed six deep.

ORBE, ORBEN, or URBACH, a neat built town of
West Switzerland, in the Pays de Vaud, on the
river Orbe, over which is a bridge. The most
remarkable objects of the place are a curious
hydraulic engine, and the botanical garden.
Population 2000: seven miles south-west of
Yverdun.

ORBELUS, a mountain chain of European
Turkey, to the westward of the great Hæmus
ridge, and rising to the greatest elevation to the
south of Sophia. Parts of this track contain
silver, copper, and iron ores, and the Turks
have here some valuable mines.

ORBIT, in astronomy, is the path of a planet
or comet, or the curve that it describes in its
revolution round its central body; thus the
earth's orbit is the curve which it describes in
its annual course round the sun. See ASTRO-
NOMY.

ORBITELLO, a town and fortress of Tus-
cany, in the province of Sienna, situated on a
kind of promontory projecting into a lake of
this name, about eighteen miles in circuit. It
has a good harbour, defended by several forts.
With the sea it communicates only by a narrow
inlet. It is chiefly remarkable for the size and
number of eels which are caught here (some of
them weighing from eight to ten lbs.), and which
are sent to Rome, Naples, and various large
towns. Eighty miles north-west of Rome, and
ninety south of Florence.

ORC, *n. s.* Lat. *orca*; Gr. *ὀρυς*. A sort of
sea-fish.

An island salt and bare,
The haunt of seals and orcs, and sea-mews' clang. *Milton.*

OR'CHARD, *n. s.* Saxon *ortgeard*, either
hortyard or wortyard, says Skinner. The Goth.
aurt, and Sax. *ort*, seem to correspond with the
Lat. *hortus*. A garden of fruit trees.

Planting of orchards is very profitable, as well as
pleasurable. *Bacon's Advice to Villiers.*

They overcome their riches, not by making
Baths, orchards, fish-pools. *Ben Jonson.*

His parsonage-house from an incommodious ruin he had rendered a fair and pleasant dwelling, with the conveniences of gardens and orchards. *Fell.*

Her private orchards walled on every side,
To lawless Sylvas all access denied. *Pope.*

Hence from the busy joy-resounding fields
In cheerful error let us tread the maze
Of Autumn unconfined, and taste revived
The breath of orchard big with bending fruit.

Thomson.

AN ORCHARD is a portion of garden ground appropriated to the growth of standard fruit-trees, or for furnishing a large supply of the most useful kinds of fruit. The trees are mostly apple, pear, plum, and cherry-trees; to render the orchard more complete, it may also contain quinces, medlars, mulberries, service-trees, filberts, Spanish nuts, barberries, walnuts, and chestnuts. The two last sorts, as well adapted for sheltering the others from high winds, should, Mr. Forsyth thinks, be planted in the boundaries of the orchard, a little closer than ordinary for that purpose. In providing trees too much care cannot be taken to admit of none but such as have good roots, fair clean stems, and proper heads; and at the same time attention should be paid that a proper assortment of the different sorts be procured for the supply of the table during the whole year. A few of the summer sorts are sufficient, but more of the autumn, and still a larger quantity of the winter kind will be necessary. Large orchards of apples are only met with in districts where cider-making is conducted upon a large scale. In some counties, as Kent, there are orchards wholly of cherries, or of cherries and filberts. In general, however, there ought to be a much larger proportion of apples than of any other fruit in orchards, as in proper situations they are very profitable, and always of fine appearance.

The extent of ground for an orchard must be proportioned, in some measure, to the extent of land, and the quantity of fruit required either for private use or for public supply; so that an orchard may be from half an acre to twenty or more in extent. With respect to the situation of an orchard, we may observe very thriving orchards both in low and high situations, on declivities and plains, in various aspects or exposures, provided the soil is good; but very low damp situations should be avoided as much as possible; for in very wet soils no fruit trees will prosper; but a moderately low situation, free from copious wet, may be more eligible than an elevated ground, as being less exposed to tempestuous winds. Yet a situation having a small declivity is very desirable, especially if its aspect incline towards the east, south-east, or south, which are more eligible than a west aspect; but a north aspect is the worst of all, unless compensated by the good quality of the soil. And, as for soil, any common field or pasture that produces good crops of corn, grass, or kitchen vegetables, is suitable for an orchard, which should be sheltered from the east, north, and westerly winds, by suitable plantations, where not naturally protected by hills or rising grounds: but such plantations, when they consist of forest-trees, should neither be too large nor too near

VOL. XVI.

the orchard; as, where that is the case, they prevent a free circulation of air. Mr. Forsyth advises, where the ground does not admit of such plantations, planting cross rows of fruit-trees, in the manner directed in gardens, as well as some of the largest growing trees, nearest the outsides exposed to those winds, two or three rows of which should be planted closer than ordinary, which would greatly shelter those in the interior parts of the orchard, and be of great service, in addition to the walnut and chestnut trees, as mentioned above. Orchards succeed well on a chalk bottom, or subsoil. On such a soil Mr. Forsyth has seen roots twelve feet deep, and the trees thrive well. Where the bottom is clay the roots should be cut-in once in four years, to prevent them from penetrating the clay, which would greatly injure the trees. Whatever the nature of the soil may be, it should have a good depth, as two or three feet.

The preparation of the ground for the reception of trees is by trenching; or, if for very considerable orchards, by deep ploughing; but trench digging, one or two spades, as the soil will admit, is the most eligible, either wholly or partially, in the places where the lines of trees are to stand, a space of six or eight feet wide, all the way in each row, especially if it be grass-ground, and intended to be kept in the sward; or, if any of the under crops are designed to be raised, the ground may be wholly trenched at first; in either case trench the ground in the usual way to the depth of the natural soil; and, if in grass, turn the sward clean to the bottom of each trench, which, when rotted, will prove an excellent manure. In planting orchards, however, on grass grounds, some only dig pits for each tree, capacious enough for the reception of the roots, loosening the bottom well, without the labor of digging any other part of the ground. The ground must be fenced securely against cattle, &c., either with a good ditch and hedge, or with a paling fence, as may be most convenient.

In bad shingly or gravelly soils Mr. Forsyth recommends that holes should be dug at least three feet deep, and filled up with good mould; if mixed up with rotten dung, rotten leaves, or other manure, the trees will in time amply repay the expense: the dung used for this purpose should be that from the melon and cucumber beds, mixed with the mould from the same, when the beds are broken up in autumn, or winter; and be laid up in heaps, and continued so for one year at least; but be frequently turned, and have some good fresh mould mixed with it.

The best season for planting all sorts of fruit trees is autumn, soon after the fall of the leaf, from about the end of October until December; or in open weather from October until March. Of apples and pears in particular, choose a much greater quantity of the autumnal and late kinds than of the early sorts; but most of all apples; for the summer fruit is of short duration, only proper for temporary service; but the later ripening kinds keep sound for some considerable time for autumnal use; and the later sorts, that ripen in October, continue in perfection for various uses all winter, and several sorts until the season

X

of apples return. Having made choice of the proper sorts, and marked them, let them be taken up with the utmost care, so as to preserve all their roots as entire as possible; and, when taken up, prune off any broken or bruised parts of the roots, and just tip the ends of the principal roots, in general, with the knife on the under side, with a kind of slope outward. If the trees have been already headed, or so trained as to have branched out into regular shoots to form each a proper head, they must be planted with the heads entire, only retrenching or shortening any irregular or ill-placed shoot that takes an awkward direction, or grows across its neighbours, or such as may run considerably longer than the rest, &c. The arrangement of the trees must be in rows, each kind separate, at distances according to the growth of the different sorts; but for the larger growing kinds, such as apples, pears, plums, cherries, &c., they should stand from twenty-five to thirty feet every way asunder, or forty feet at most. Each species and its varieties should generally be in rows by themselves, the better to suit their respective modes of growth: though for variety there may be some rows of apples and pears arranged alternately, as also of plums and cherries; and towards the boundaries there may be ranges of lesser growth, as quinces, medlars, filberts, &c., and the outer row of all may be walnut-trees, and some chestnuts, set pretty close to defend the other trees from violent winds. According to the above distances proceed to stake out the ground for making the holes for the reception of the trees; which, if made to range every way, will have a very agreeable effect, and admit the currency of air and the sun's influence more effectually. In planting very extensive orchards some divide the ground into large squares of different dimensions, with intervals of fifty feet between; serving both as walks, and for admitting a greater currency of air; in different quarters planting different sorts of fruit, as apples in one, pears in another, and plums and cherries in another, &c., and thus it may be repeated to as many quarters for each species and its varieties as may be convenient. As to the mode of planting the trees, a wide hole must be dug for each, capacious enough to receive all the roots freely every way without touching the sides. When the holes are all ready proceed to planting, one tree in each hole, a person holding the stem erect, whilst another trims in the earth, previously breaking it small, and casting it in equally all about the roots, frequently shaking the tree to cause the mould to settle close about all the smaller roots and fibres, and so as to raise the tree gradually up, that the crown of the roots may be but two or three inches below the general surface; and, when the hole is filled up, tread it gently, first round the outside, then near the stem of the tree, forming the surface a little hollow; and then if on the top of all is laid some inverted turf to the width of the holes, forming it with a sort of circular bank, three or four inches high, it will support the tree, and guard the roots from drying winds and summer's drought; observing that each tree stand perfectly upright, and that they range exactly in their proper rows.

The *after management* consists principally in keeping the trees properly pruned and cut; as, where this is judiciously done, the trees will come into bearing sooner, and long continue in vigor. But with standard trees less culture is necessary than in other cases. No branch should ever be shortened unless for the figure of the tree, and then it should be taken off close at the separation. The more the range of branches shoot circularly, a little inclining upwards, the more equally will the sap be distributed, and the better the tree bear. The ranges of branches should not be too near each other, that the fruit and leaves may not be deprived of their full share of sun; and, where it suits, the middle of the tree should be so free from wood that no branch may cross another, but all their extremities point outwards. About October or November, or as soon as the fruit is removed, is the most proper season for this work.

Take off superfluous branches with a saw, and afterwards smooth the place with a knife; for it is essential that every branch that is to come off should be cut perfectly close and smooth. The wounded part may then be smeared over with composition. Such branches should always be taken off as come near to the ground, that have received any material injury, where the leaves are much curled, or that have a tendency to cross the tree, or run inwards: and attention may be given to the beauty of the head, leaving all the branches as nearly equidistant as possible. Where there are any remaining blotches they should be opened or scored with a knife; and where the bark is ragged, from any laceration, it should be pared gently down to the live wood: the moss should be rubbed clean off, and the trees scored. In this last operation care should be taken not to cut through the inner or white rind, which joins the bark to the wood. The young shoots, in spring, should be rubbed off, and not cut, as cutting is apt to increase the number. The great enemy of apple-orchards is misletoe, and it is often permitted to become very injurious. The usual method of clearing trees from it is to pull it out with hooks in frosty weather, when brittle. A laborer is capable of clearing fifty or sixty trees in a day. Other diseases to which orchard-trees are subject are the canker, gum, mildew, and blight, which are rather to be prevented by such culture as will induce a healthy state than to be remedied by topical applications. Too much lime, Sir H. Davy thinks, will bring on the canker, and if so, the replacing a part of such soil with alluvial or vegetable earth would be of service. The gum, it is said, may be constitutional, arising from offensive matter in the soil; or local, arising from external injury. In the former case, improve the soil; in the latter, apply the knife. The mildew, it is observed by T. A. Knight and Abercrombie, may be easily subdued at its appearance by scattering flour of sulphur upon the infected parts. As this disease is now generally considered the growth of parasitical fungi, the above remedy is likely to succeed. For the blight and caterpillars Forsyth recommends burning of rotten wood, weeds, potatoe haulm, wet straw, &c., on the windward side of the trees when they are in blossom. He

also recommends washing the stems and branches of all orchard trees with a mixture of fresh cowdung with urine and soap-suds, as a white-washer would wash the ceiling or walls of a room. The promised advantages are, destruction of insects and 'fine bark'; more especially, he adds, 'when you see it necessary to take all the outer bark off.'

Mr. Bucknell found it impossible to take off great branches of fruit-trees without leaving a stump, or improper wound: and, as it is essential that every branch be cut perfectly close and smooth, be used saws, and afterwards smoothed over the saw-cut with a knife, immediately applying his medicated tar to the wound. This tar is composed of half an ounce of corrosive sublimate, reduced to a fine powder, and put into a three-pint pipkin, with a glassful of spirits of hartshorn, and stirred well together till the sublimate is dissolved. The pipkin is then filled by degrees with common tar, and constantly stirred till the mixture is blended as intimately as possible. This composition has been found by Mr. Bucknell to answer the purposes of excluding the air, keeping off insects and vermin of every description, and of assisting the wound to heal.

'In heading down old decayed apple-trees, for the sake of symmetry,' says the author of the *Treatise on Fruit-trees*, 'it will be necessary to cut at the forked branches, as near as can be to the upper side of the fork, cutting them in a sloping manner to carry off the wet, at the same time rounding the edges. The orchardist may begin at the lower branches, cutting just above the lower bark, and, proceeding upwards, cut the rest of the branches to six joints or forks, according to their strength, till he have finished cutting in the whole head. If any of these branches should have the canker all the infected part must be cut out. When the tree is all prepared, the composition must be immediately applied, beginning at the top of the tree, and finishing with the powder of wood ashes and burnt bones in descending, which will save its being rubbed off during the operation, and the composition will prevent the sun and air from injuring the naked inner bark. A tree thus prepared will, in the course of three or four years, produce more and finer fruit than a maiden tree that has been planted upwards of twenty years.'

Mr. Marshall, in his *Rural Economy of Gloucestershire and Herefordshire*, observes that spring frosts are an enemy, against which, perhaps, it is most difficult to guard orchard trees. Dry frosts are observed to have no other effects than keeping the blossoms back; consequently are frequently serviceable to fruit-trees. But wet frosts, namely, frosts after rain or a foggy air, and before the trees have had time to dry, are very injurious even to the buds. An instance is mentioned in which a flying hazy shower in the evening was succeeded by a smart frost: that side of the trees against which the haze drove was entirely cut off; while the opposite side, which had escaped the moisture, likewise escaped the effect of the frost.

The Hereford Agriculture Report insists that the pear, although, in general, producing an inferior liquor, possesses many advantages for ge-

neral culture, when compared with the apple. It will flourish in a greater variety of soils, is more productive, and being incapable (in those sorts which are proper for perry) to be eaten or applied to any common culinary purpose, it is little subject to be stolen, even in situations where fruit does not abound. As an ornamental tree, it possesses sufficient merit to entitle it to a place where ornament is the principal object; its form is often picturesque, and it blossoms in the spring, and its fruit in autumn is always beautiful. Every tree, when nearly full grown, will afford, in moderately good ground, an annual produce of twenty gallons of liquor (taking many years together), even at the lowest calculation. Many single trees in Herefordshire have produced a hogshead in one season, and an extraordinary tree growing on the glebe land of the parish of Hom Lacy has more than once filled fifteen hogsheads in the same year; when the branches of this tree, in its original state, became long and heavy, their extreme ends successively fell to the ground, and, taking fresh root at the several points where they touched it, each branch became a new tree, and in its turn produced others in the same way. The produce of an acre planted with apple-trees will generally be found nearly one-third less than the same quantity of ground planted with pear-trees would afford, with the exception of the halmer pear, and oldfield; but the apple tree begins to bear at an earlier age, and cider will ever be justly preferred to the juice of the pear. As an object of sight, the pear-tree has every advantage over its rival; but Mr. A. Knight is of opinion that under the system now practising, to procure new varieties, the apple-tree may, in some degree at least, acquire the recommendation of ornament, as well as use: those crossed with the Siberian crab promise to be of this description.

Orchards, says Mr. Loudon, have doubtless existed in Britain for many ages as appendages to wealthy religious establishments; but as objects of farming, or field culture, they do not appear to have been adopted till about the beginning of the seventeenth century.'

'The most generally useful fruit that can be grown in farm orchards is the apple; next the pear; then the plum for tarts, or wine; and to these may be added the cherry, filbert, walnut, chestnut, and elder. In the cider countries where the climate is more certain than in some others, it is customary to plant but a few good sorts; and not to mix above one or two sorts together in making cider; in the northern districts, on the contrary, it is a maxim to plant a considerable number of different sorts, both of those which blossom early and late; because, should the blossoms of one variety be destroyed by a frosty wind, that of another may escape. In cold districts, it is advisable to plant orchards in sheltered hollows, exposed to the sun, and to plant thick; but in the warmer southern counties, many descriptions of cider and perry fruits may be grown to perfection in the hedge-rows, or as cultured trees in permanent pastures.'

We are indebted to this author for the following

The most approved sorts of cider pears, according to this writer, are the following :—

Barland, Pom. Her. t. 27, Forsyth, p. 143, fruit very austere, hardly upright tree. Holmore, Pom. Her. t. 20, Forsyth, p. 144, upright tree. Huffcap, Pom. Her. t. 24., Forsyth, p. 154, fruit austere, large, hardy trees. Oldfield, Pom. Her. t. 11, Forsyth, p. 144, large tree. Rough cap, Forsyth, p. 144, very austere, hardy free-growing tree. Squash teinton, Pom. Her. t. 13, Forsyth, p. 144, fruit very austere, upright tree and great bearer.

The baking and dessert pears fit for orchards, according to Nicol, are the following :—* Jargonelle, Crawford or lammas, * carnock or drummond, * gray achan, swan egg, * moorfowl egg * yair, * golden knap (good), Longueville, * summer bergamot, * autumn ditto, * Scot's ditto, musk robin (good), saffron, * hanging leaf (very good), the pound pear, cadillac, warden (for baking).

The best sorts of baking plums are, damson, bullace, muscle, winesour, and magnum bonum. Of these the damson is by far the best, and next the winesour, which thrives only on a calcareous soil, and grows wild in abundance in the West Riding of Yorkshire.

The following are excellent dessert plums for an orchard :—* Green-gage, Orleans, * damask (black, good), white perdigon, * blue ditto, blue gage, * white magnum bonum, red ditto or imperial, * drap d'or (yellow, good). Of these the green-gage, Orleans, and damask are much the best.

ORCHESTRA, *n. s.* Gr. *ὀρχήστρα*. The place occupied by musicians at a public entertainment.

ORCHESTRA, in the Grecian theatres, was that part of the proscenium or stage where the chorus used to dance. In that of Athens a kind of altar was erected in the *ὀρχήστρα*, called the *θυμιατήρ* (thymele among the Romans), which sometimes served to offer sacrifices on to Bacchus (whence the edifice was named the Theatre of Bacchus), and sometimes as a tribune from which orations were made by the magistrates and orators to the assembled people, it being customary for the Greeks often to hold public meetings in their theatres. It is probable that this altar, as well as the orchestra itself (of which it formed the centre) was sunk somewhat below the level of the proscenium (as in modern days), in order that the view of the performance on the stage might not be interrupted. The orchestra was semi-circular and surrounded with seats. In the Roman theatres it made no part of the scena, but answered pretty nearly to the pit in our play-houses, being taken up with seats for senators, magistrates, vestals, and other persons of distinction. The actors never went down into it.

ORCHIA Lex, instituted by Orchius the tribune of Rome, A. U. C. 566. Its intention was to limit the number of guests that were to be admitted at an entertainment; and it also enforced that during supper, which was the chief meal among the Romans, the doors of every house should be left open.

ORCHILLA, a small cluster of islands in the

West Indies, near South America. The largest is in the form of a crescent, and low, excepting on the east and west capes. Here the trees and verdure abound, whilst on the other sides the soil is barren. The only animals are goats and lizards; and it contains but little fresh water. On the south-west side the water is very deep, and the shore perpendicular, like a wall. The different islands are separated by narrow channels of difficult navigation. Long. 65° 20' W., lat. 12° N.

ORCHIS, in botany, a genus of the diandria order, and gynandria class of plants; natural order seventh, orchidæ. Its characters are these: it has a single stalk, with a vague sheath, and no empalement; the flower has five petals, three without and two within; the nectarium is of one leaf, fixed to the side of the receptacle, between the division of the petals; the upper lip is short and erect, the under large, broad, and spreading; the tube pendulous, corniform, or like a horn, and prominent behind; it has two short slender stamina, sitting upon the pointal, with oval erect summits, fixed to the upper lip of the nectarium; there is an oblong contorted germen, under the flower, with a short style, fastened to the upper lip of the nectarium; the germen afterwards turns to an oblong capsule, with one cell, having three keel-shaped valves, opening on the three sides, but jointed at top and bottom, filled with small seeds like dust. Miller enumerates ten, and Linneus thirty-three species. All those sorts of orchis described by Miller grow wild in several parts of England, but, on account of the extreme beauty of their flowers, deserve a place in every good garden; and the reason of their not being cultivated in gardens proceeds from the difficulty of transplanting them: though this may be easily overcome, where a person has an opportunity of marking their roots, in their time of flowering, and letting them remain until their leaves are decayed, when they may be transplanted with safety. But, if their soil and situation be adapted to their various sorts, they will thrive and continue several years, and during their season of flowering will afford as great varieties as any flowers which are at present cultivated. The most remarkable species are

O. mascula, with a root composed of two bulbs, crowned with oblong, broad, spotted leaves; upright stalks, a foot high; garnished with one or two narrow amplexicaule leaves; and terminated by a long spike of reddish purple flowers, having the petals reflexed backward; a quadrilobed crenated lip to the nectarium, and an obtuse horn. The flowers of this species possess a very agreeable odor. This species is the most valuable.

O. militaris has a double bulbous root, crowned with oblong amplexicaule leaves; erect flower-stalks, eight or ten inches high; terminated by a loose spike of ash-colored and reddish flowers, having confluent petals; a quinquefid, rough, spotted lip to the nectarium, and an obtuse horn. The structure of the flowers exhibits the figure of a naked man; and are often of different colors in the same flower, as ash-color, red, brown, and dark-striped.

O. morio, has a double bulbous root, crowned with oblong, ribbed, spreading leaves; erect flower-stalks, eight or ten inches high; garnished with a few amplexicaule leaves; and terminated by a short loose spike of flowers, having connivent petals, a quadrifid crenated lip to the nectarium, and an obtuse horn. All the species are very hardy perennials, with bulbous fleshy roots. The flowers appear in May, June, and July, but principally in June: their mode of flowering is universally in spikes, many flowers in each spike; and each flower is composed of five petals in two series, and a nectarium. This plant flourishes in various parts of Europe and Asia, and grows in our country spontaneously, in great abundance. It is assiduously cultivated in the east; and the root of it forms a considerable part of the diet of the inhabitants of Turkey, Persia, and Syria. From it is made the alimentary powder called salep; which, prepared from foreign roots, is sold at 5s. or 6s. per lb., though it might be furnished by ourselves at the sixth part of that price, if we would cultivate this plant. The orchis mascula is the most valued for this purpose. A dry, and not very fertile, soil is best adapted to its growth. The most fit time for gathering the roots is when the seed is formed, and the stalk is ready to fall; because the new bulb, of which the salep is made, is then arrived at its full maturity, and may be distinguished from the old one by a white bud rising from the top of it, which is the germ of the orchis of the succeeding year.

ORCUS, or Pluto, god of the infernal regions, so called from *ορχος*, a tomb or sepulchre, or from *ορκος* an oath by the river Styx. The ancients gave this name also to all the divinities of the infernal regions, even to Cerberus. This deity has also been confounded with Charon: he had a temple at Rome.

ORCUS, a river of Thessaly, which took its rise from the marshes of the Styx, and the waters of which were so thick that they floated like oil upon the surface of the river Peneus, into which they discharged themselves.

ORDAIN, *v. a.* } Fr. *ordonner*; Span. and
ORDAINER, *n. s.* } Port. *ordinar*; Ital. *ordinare*;
Lat. *ordino*. To fix; decree; appoint; settle;
institute; invest with office or power.

All signified unto you by a man who is *ordained*
over the affairs, shall be utterly destroyed. *Ester.*
As many as were *ordained* to eternal life believed.

He commanded us to testify that it is he which
was *ordained* of God to be the judge of quick and
dead. *Acts x. 42.*

Know the cause why musick was *ordained*;
Was it not to refresh the mind of man
After his studies, or his usual pain? *Shakespeare.*
Malmutius

Ordained our laws, whose use the sword of Caesar
Hath too much mangled. *Id. Cymbeline.*

God, from Sinai descending, will himself
In thunder, lightning, and loud trumpets sound,
Ordain them laws. *Milton's Paradise Lost.*

St. James was bishop of Jerusalem, and St. Peter,
James, and John, were his *ordainers*.

To souls oppressed and dumb with grief,
The Gods *ordain* this kind relief,
Jeremy Taylor.

That musick should in sounds convey
What dying lovers dare not say. *Wallor.*
Meletius was *ordained* by Arian bishops, and yet
his ordination was never questioned. *Stillington.*
The fatal test,

The scene of death, and place *ordained* for punish-
ment. *Lryden.*

Some laws *ordain*, and some attend the choice of
holy senates, and elect by voice. *Id.*

My reason bends to what thy eyes *ordain*;
For I was born to love, and thou to reign.

Sure 'tis the happy hour *ordained* above,
When vanquished vice shall tyrannize no more.

Ye sylphs of death, on demon pinions
Around the guillotine *ordained* for Pitt. *Canning.*

OR'DEAL, *n. s.* Sax. *orþal*; Goth. *ordil*;
Fr. *ordalie*; barb. Lat. *ordalium*. The prefix *or*
or *ur* has been traced to the Chald. *ur*, fire.
An ancient form of trial by fire; also by water:
see below.

Where so you list, by *ordal* or by othe,
By sorte or in what wise, so that you leste
For love of God, let prove it for the beste,
And if that I be gilty dome die. *Chaucer.*
Their *ordal* laws they used in doubtful cases,
when clear proofs wanted. *Hakewill on Providence.*
In the time of king John, the purgation per ignem
et aquam, or the trial by *ordal*, continued; but it
ended with this king. *Hale.*

ORDEAL was an ancient form of trial. See
TRIAL. It was an appeal to the immediate
interposition of divine power, and was peculiarly
distinguished by the appellation of *judicium*
Dei; and sometimes vulgaris purgatio, to dis-
tinguish it from the canonical purgation, which
was by the oath of the party. That the purga-
tion of *ordal*, of some one kind or other, is
very ancient, admits not of a doubt; and that
it was very universal in the times of super-
stitious barbarity is equally certain. It seems
even to have been known to the ancient Greeks.
And Grotius gives us many instances of water
ordal, in Bithynia, Sardinia, and other places.

There were two sorts of it more common than
the rest, in *Europe*, by fire, and by water. The
former was confined to persons of higher rank,
the latter to the common people. Both these
might be performed by deputy; but the prin-
cipal was to answer for the success of the trial,
the deputy only venturing some corporal pain,
for hire, or perhaps for friendship. The fire
ordal was performed either by taking up in
the hand, unhurt, a piece of red-hot iron, one,
two, or three pounds weight; or else by walk-
ing barefoot and blindfold over nine red-hot
plough-shares, laid lengthwise at unequal dis-
tances: and, if the party escaped being hurt, he
was adjudged innocent; but if it happened
otherwise, as without collusion it usually did, he
was then condemned as guilty. Water *ordal*
was performed, either by plunging the bare arm
up to the elbow in boiling water, and escaping
unhurt thereby, or by casting the person sus-
pected into a river or pond of cold water; and,
if he floated therein without any action of
swimming, it was deemed an evidence of his
guilt; but if he sunk he was acquitted. It is
easy to trace out the traditional relics of this
water *ordal*, in the ignorant barbarity still prac-

tised in many countries to discover witches, by casting them into a pool of water, and drowning them to prove their innocence. In the Eastern empire the fire ordeal was used for the same purpose, by the emperor Theodore Lascaris, who, attributing his sickness to magic, caused all those whom he suspected to handle the hot iron; thus joining (as has been well remarked) to the most dubious crime in the world the most dubious proof of innocence. Besides these methods of trials, there were some others common in Europe; as the judicial combat, the ordeal of the cross, and the ordeal of the corsned. The judicial combat was well suited to the genius and spirit of fierce and warlike nations, and was one of the most ancient and universal modes of trial. It was exceedingly common in Germany in very remote ages. It was also used in some countries on the continent at pretty early periods: it is not, however, mentioned in any of the Anglo-Saxon laws; and it does not appear to have been much used in England till after the Conquest. There are, however, two remarkable instances of it recorded in Dr. Henry's History of Great Britain, to which we shall refer the inquisitive reader. We need scarcely add, that this detestable form of trial was the foundation of the no less detestable crime of duelling, which disgraces our age and nation. See DUEL. It was so much the custom, in the middle ages of Christianity, to respect the cross even to superstition, that it would have been indeed wonderful if the same ignorant bigotry had not converted it into an ordeal: accordingly we find it used for this purpose, and in so many different ways as almost to preclude description. Dr. Henry gives the following account of it:—'In criminal trials, the judgment of the cross was commonly thus conducted. When the prisoner had declared his innocence upon oath, and appealed to the judgment of the cross, two sticks were prepared exactly like one another; the figure of the cross was cut on one of these sticks, and nothing on the other: each of them was then wrapped up in a quantity of fine white wool, and laid on the altar, or on the relics of the saints; after which a solemn prayer was put up to God, that he would be pleased to discover, by evident signs, whether the prisoner was innocent or guilty. These solemnities being finished, a priest approached the altar, and took up one of these sticks, which was uncovered with much anxiety. If it was the stick marked with the cross, the prisoner was pronounced innocent; if it was the other, he was declared guilty.' When the judgment of the cross was appealed to, in civil causes, the trial was conducted in this manner:—The judges, parties, and all concerned, being assembled in a church, each of the parties chose a priest, the youngest and stoutest that he could find, to be his representative in the trial. These representatives were then placed one on each side of some famous crucifix; and, at a signal given, they both at once stretched their arms at full length, so as to form a cross with their body. In this painful posture they continued to stand while divine service was performing; and the party whose representative dropped his arms first lost his

cause. These, and the like relics of superstition and barbarism, were abolished in England (as had been done in Denmark above a century before), by act of parliament 3 Hen. III. according to Sir Edward Coke, or rather by an order of the king in council.

We have, in Mr. Turner's well known History of the Anglo-Saxons, a full account of the ordeals in use among that people from the laws of Ina. 'The iron,' says Mr. Turner, 'was to be three pounds in weight for the threefold trial, and therefore probably one pound only for the more simple charge; and the accused was to have the option, whether he would prefer the water ordeal or the iron ordeal.'

No man was to go within the church after the fire was lighted by which the ordeal was to be heated, except the priest and the accused. The distance of nine feet was to be then measured out, from the stake, of the length of the foot of the accused. If the trial was to be by hot water, the water was heated till it boiled furiously; and the vessel that contained it was to be iron or copper, lead or clay.

If the charge was of the kind they called anfeald, or simple, the accused was to immerge his hand as far as the wrist in the water, to take out the stone; if the charge was of a threefold magnitude, he was to plunge his arm up to the elbow.

When the ordeal was ready, two men were to enter of each side, and to agree that the water was boiling furiously. Then an equal number of men were to enter from each side, and to stand along the church on both sides of the ordeal, all fasting. After this the priest was to sprinkle them with holy water, of which each was to taste; they were to kiss the gospels, and to be signed with the cross. All this time the fire was not to be mended any more; but the iron, if the ordeal was to be by hot iron, was to lie on the coals till the last collect was finished; and it was then to be placed on the staples which were to sustain it.

While the accused was snatching the stone out of the water, or carrying the hot iron for the space of nine feet, nothing was to be said but a prayer to the Deity to discover the truth. The hand was to be then bound up and sealed, and to be kept so for three days; after that time the seal and the bandage were removed, and the hand was to be examined, to see whether it was foul or clear.

From this plain account, the ordeal was not so terrible as it may at first sight appear; because, independently of the opportunity which the accused had, by going alone into the church, of making terms with the priest, and of the ease with which his dexterity could have substituted cold iron or stone for the heated substances, at the moment of the trial, and the impossibility of the detection, amid the previous forms of the holy water, the diminution of the fire, prayers on the occasion, and the distance of the few spectators; independently of these circumstances, the actual endurances of the ordeal admitted many chances of acquittal. It was not exacted that the hand should not be burnt, but that after the space of three days it should not ex-

hibit that appearance which would be called foul or guilty. As the iron was to be carried only for the space of nine of the feet of the accused, it would be hardly two seconds in his hand. The hand was not to be immediately inspected, but it was carefully kept from air, which would irritate the wound, and was left to the chances of a good constitution to be so far healed in three days, as to discover those appearances when inspected, which were allowed to be satisfactory. Besides there was, no doubt, much preparatory training, suggested by the more experienced, which would indurate the epidermis so much as to make it less sensible to the action of the hot substances which it was to hold.

Ordeals were forbidden on festivals and fast-days.

Of the single ordeal it was ordered, that if the persons had been accused of theft, and were found guilty by it, and did not know who would be their borh, they should be put into prison, and be treated as the laws had enjoined.

An accused mint-master was to undergo the ordeal of the hot iron.

The ordeal might be compounded for.

The law of Æthelstan added some directions as to the ordeal. Whoever appealed to it was to go three nights before to the priest who was to transact it, and should feed on bread and salt, water and herbs. He was to be present at the masses in the mean time, and make his offerings and receive the holy sacrament on the day of his going through the ordeal; and he should swear that with fole-right he was guiltless of the accusation before he went to the ordeal. If the trial was the hot water, he was to plunge his arm half way above the elbow on the rope. If the ordeal was the iron, three days were to pass before it was examined. They who attended were to have fasted, and not to exceed twelve in number of either side; or the ordeal was to be void unless they departed.

A thief found guilty by the ordeal was to be killed, unless his relations redeemed him by paying his were, and the value of the goods, and giving borh for his good behaviour.

The command of the ordeals must have thrown great power into the hands of the church; and, as in most cases they who appealed to them did so from choice, it is probable that whoever expressed this deference to the ecclesiastical order were rewarded for the compliment, as far as discretion and contrivance would permit.

ORDER, *n. s.*, *v. a.* & *v. n.*

OR'DERER, *n. s.*

OR'DERLESS, *adj.*

OR'DERLY, *adj.* & *adv.*

OR'DERLINESS, *n. s.*

OR'DERS.

rank; architectural mode or fashion; class; fraternity: hence proper state or standing; regular government; society of persons remarkable for particular honors or insignia; and, in the plural, hierarchical or clerical state: to order is, to regulate; manage; adjust; dispose; conduct; command; give command or direction: an orderer, one who regulates, commands, or methodises: orderless is, disorderly; without rule or order: orderly, methodically; observant of method; not

Fr. *ordre*; Lat.

ordo. Method;

arrangement; regulation; regular

process or mode;

rule; means; care;

tumultuous or clamorous; according to established rule: orderliness follows these senses.

The king commanded the high priest, and the priests of the second order, to bring forth out of the temple all the vessels. *2 Kings* xxiii. 4.

These were the orderings of them in their service, to come into the house of the Lord.

1 Chron. xxiv. 19.

To him that ordereth his conversation aright will I shew the salvation of God. *Psalms* l. 23.

The money promised unto the king he took no order for, albeit Sosthratus required it. *2 Mac.* iv.

It is walled with brick and stone, intermixed orderly. *Sandys.*

The kitchen clerk that hight digestion,

Did order all the cates in seemly wise. *Spenser.*

It were meet you should take some order for the soldiers, which are now first to be discharged and disposed of some way; which may otherwise grow to as great inconvenience as all this that you have quit us from. *Spenser on Ireland.*

The church hath authority to establish that for an order at one time, which at another time it may abolish, and in both do well. *Hooker.*

As for the orders established, sith the law of Nature, of God and man, do all favour that which is in being, till orderly judgment of decision be given against it, it is but justice to exact obedience of you. *Id.*

The book requirith due examination, and giveth liberty to object any crime against such as are to be ordered. *Whitgift.*

Then to their dams

Lets in their young; and wondrous orderly,

With manly haste, dispatch his housewifery. *Chapman.*

Provide me soldiers,

Whilst I take order for mine own affairs. *Shakespeare.*

Give order to my servants, that they take

No note of our being absent. *Id.*

Find a barefoot brother out,

One of our order, to associate me,

Here visiting the sick. *Id. Romeo and Juliet.*

All form is formless, order orderless,

Save what is opposite to England's love. *Shakespeare.*

Make it orderly and well,

According to the fashion of the time. *Id.*

Bias, being asked how a man should order his life, answered, as if a man should live long, or die quickly. *Bacon.*

Princes many times make themselves desires, and set their hearts upon toys; sometimes upon a building; sometimes upon erecting of an order. *Id.*

To know the true state of Solomon's house, I will keep this order; I will set forth the end of our foundation, the instruments for our works, the several employments assigned, and the ordinances we observe. *Id. New Atlantis.*

This order with her sorrow she accords,

Which orderless all form of order brake. *Daniel.*

Virgins must remember that the virginity of the body is only excellent in order to the purity of the soul; for, in the same degree that virgins live more spiritually than other persons, in the same degree is their virginity a more excellent state. *Taylor.*

But yet, supposing that Presbyters were included under the word Episcopos, yet it is not because the offices and orders are one, but because that the order of Presbyter is comprehended within the dignity of a bishop. *Jeremy Taylor.*

If the lords of the council issued out any *order* against them, or if the king sent a proclamation for their repair to their houses, presently some noblemen published a protestation against those *orders* and proclamations. *Clarendon.*

Balfour, by an *orderly* and well-governed march, passed in the king's quarters, without any considerable loss, to a place of safety. *Id.*

Th' Almighty seeing,
From his transcendent seat the saints among,
To those bright *orders* uttered thus his voice.

Milton.
So spake the universal Lord, and seemed
So *ordering*. *Id.*

How should those active particles, justified by the occusion of other bodies, whereof there is an infinite store, so *orderly* keep their cells without any alteration of site? *Glanville.*

As there is no church where there is no *order*, no ministry; so, where the same *order* and ministry is, there is the same church. *Pearson.*

When Christians became a distinct body, courts were set up by the *order* of the Apostles themselves, to minister judicial process. *Kettleworth.*

We should behave reverently towards the Divine Majesty, and justly towards men; and, in *order* to the better discharge of these duties, we should govern ourselves in the use of sensual delights with temperance. *Tillotson.*

She left immortal trophies of her fame,
And to the noblest *order* gave the name. *Dryden.*
If the faults of men in *orders* are only to be judged among themselves, they are all in some sort parties. *Id.*

As St. Paul was full of the doctrine of the gospel, so it lay all clear and in *order*, open to his view. *Locke.*

Any of the faculties wanting, or out of *order*, produce suitable defects in men's understandings. *Id.*

In the body, when the principal parts, the heart and liver, do their offices, and all the inferior smaller vessels act *orderly* and duly, there arises a sweet enjoyment upon the whole, which we call health. *South's Sermons.*

Kings are the fathers of their country; but, unless they keep their own estates, they are such fathers as the sons maintain, which is against the *order* of Nature. *Davenant.*

By shining marks, distinguished they appear,
And various *orders* various ensigns bear. *Granville.*

Having in his youth made a good progress in learning, that he might dedicate himself more entirely to religion, he entered into holy *orders*, and in a few years became renowned for his sanctity of life. *Addison's Spectator.*

Like use you make of the equivocal word dignity, which is of *order*, or office, or dominion, or nature; and you artificially blend and confound all together. *Waterland.*

What we see is in *order* only to what we do not see; and both these states must be joined together. *Asterbury.*

A clergy, reformed from popery in such a manner as happily to preserve the mean between the two extremes, in doctrine, worship, and government, perfected this reformation by quiet and *orderly* methods, free from those confusions and tumults that elsewhere attended it. *Id.*

When Ouranus first entered into holy *orders*, he had haughtiness in his temper, a great contempt and disregard for all foolish and unreasonable people; but he has prayed away this spirit. *Law.*

One man pursues power in *order* to wealth, and another wealth in *order* to power, which last is the safer way, and generally followed. *Swift.*

The moderator, when either of the disputants breaks the rules, may interpose to keep them to *order*. *Watts.*

In a colonade, or range of pillars, the intercolumniation or space between columns in the Tuscan *order* is four diameters; in the Doric *order* two and three-quarters; in the Ionic *order* two and a quarter; in the Corinthian *order* two; and in the Composite *order* one and a half. *Builder's Dictionary.*

I have received an *order* under your hand for a thousand pounds in words at length. *Tatler.*

Thine *orders*, mighty Sultan, are performed, and all Irene now is breathless clay. *Johnson's Irene.*

With sparkling gems bedecked it round:

With gems, that, ranged in *order* due,
Present the fair one's name to view. *Sheridan.*

Pray, Snee, won't you go to Drury-Lane theatre the first night of Puff's tragedy?

SNEER. Yes; but I suppose one shan't be able to get in; for on the first night of a new piece they always fill the house with *orders* to support it. *Id.*

We'll add a title—
"Count Arnold:" it hath no ungracious sound,
And will look well upon a billet-doux.

ARNOLD. Or in an *order* for a battle-field. *Byron.*

ORDER, in architecture. See ARCHITECTURE.

ORDER is also the title of certain ancient books, containing the divine office, with the *order* and manner of its performance. The Roman *order* is that wherein are laid down the ceremonies which obtain in the Romish church. See RITUAL.

ORDERS, in a military sense, all that is lawfully commanded by superior officers. Orders are given out every day, whether in camp, garrison, or on a march, by the commanding officer; which orders are afterwards given to every officer in writing by their respective sergeants.

ORDERS, HOLY, or ORDERS by way of eminence, denote a character peculiar to ecclesiastics, whereby they are set apart for the ministry. See ORDINATION. This the Roman Catholics make their sixth sacrament. In no reformed church are there more than three orders; viz. bishops, priests, and deacons. In the Roman church there are seven, exclusive of the episcopate; all which the council of Trent enjoins to be received and believed, on pain of anathema. They are distinguished into petty or secular orders, and major or sacred orders. *Orders*, *petty*, or *minor*, are four: viz. those of door-keeper, exorcist, reader, and alcolthy. Those in petty orders may marry without a dispensation; in effect, the petty orders are looked on as little other than formalities, and as degrees necessary to arrive at the higher orders. Yet the council of Trent is very serious about them; enjoins that none be admitted into them without understanding Latin; and recommends it to the bishops to observe the intervals of conferring them, that the persons may have a sufficient time to exercise the function of each order; but it leaves the bishops a power of dispensing with these rules; so that the four orders are usually conferred the same day, and only make the first part of the ceremony of ordination. The Greeks disavow these petty orders, and pass immediately to the subdiaconate; and the reformed to the diaconate. Their first rise Fleury dates in the time of the emperor Justinian. There is no call nor benefice required for the four petty

orders; and even a bastard may enjoy them without any dispensation; nor does a second marriage disqualify. *Orders, sacred, or major*, are three; viz. those of deacon, priest, and bishop. The council of Trent forbids any person being admitted to the major orders, unless he be in peaceable possession of a benefice sufficient for a decent subsistence; allowing no ordinations on patrimonies or pensions, except where the bishop judges it for the service of the church. A person is said to be promoted to orders per saltum, when he has not before passed the inferior orders. The council of Constantinople forbids any bishop being ordained without passing all the degrees; yet church history records instances of bishops consecrated without having passed the order of priesthood; and Panormas thinks such an ordination valid.

ORDINABLE, *adj.* } Fr. *ordinal*; Lat. *or-*
ORDINAL, *adj.* & *n. s.* } *dinale, ordino*. Such
ORDINANCE, *n. s.* } as may be appointed:
ordinal is marking or denoting order; thus first, second, and third, are ordinal numbers: also, as a noun substantive, a ritual of devotions; a book containing orders: ordinance is, rule; law; that which is ordained, commanded, or appointed: used by Shakspeare for cannon. See ORDINANCE.

I have no woman sufficient certain
The chambers to arrange in ordinance
After my lust. *Chaucer.*
It seemeth hard to plant any sound ordinance, or
reduce them to a civil government; since all their ill
customs are permitted unto them. *Spenser.*

Let Richard and Elizabeth,
The true successors of each royal house,
By God's fair ordinances conjoin together!
Shakspeare.

Caves and womby vaultages of France,
Shall chide your trespass and return your mock,
In second accent to his ordinance. *Id.*

There are seven Egyptian masters from whose
slavery Christ hath delivered us. Sin, an accusing
conscience, danger of God's wrath, tyranny of Satan,
the curse of the law, Mosalcal ceremonies, and hu-
man ordinances. *Bp. Hall.*

All the ways of oeconomy God hath used toward
a rational creature, to reduce mankind to that course
of living which is most perfectly agreeable to our na-
ture, and by the mercy of God *ordinable* to eternal
bliss. *Hammond.*

The moon's age is thus found: add to the epact
the day of the month, and the ordinal number of that
month, from March inclusive, because the epact be-
gins at March, and the sum of those, casting away
thirty or twenty-nine, as often as it ariseth, is the
age of the moon. *Helder.*

One ordinance ought not to exclude the other,
much less to disparage the other, and least of all to
undervalue that which is the most eminent. *Taylor.*

AN ORDINANCE is a statute or command of a
sovereign or superior; thus the acts of parlia-
ment are sometimes termed ordinances of parlia-
ment, as in the parliament rolls. Though in
some cases we find a difference made between
the two; ordinances being only temporary
things, by way of prohibition; and capable of
being altered by the commons alone; whereas
an act is a perpetual law, and cannot be altered
but by king, lords, and commons. Coke asserts

that an ordinance of parliament differs from an
act, as the latter can only be made by the king,
and the threefold consent of the estates; whereas
the former may be made by one or two of them.

ORDINARY, *adj.* & *n. s.* } Fr. *ordinaire*;
ORDINARILY, *adv.* } Ital. Span. and
Port. *ordinario*; Lat. *ordinarius*. Established;
regular; methodical; usual; common; mean;
ugly: as a noun substantive, established state;
actual and usual office; established judge; par-
ticularly, in this country, an established judge
in the ecclesiastical law; regular price of a meal;
a place of taking meals at a price: ordinarily is
according to established rule or method; com-
monly; of course.

The evil will
Of all their parishioners they had constrained,
Who to the ordinary of them complained.

If fault be in these things any where justly found,
law hath referred the whole disposition and redress
thereof to the ordinary of the place. *Hooker.*

Men of common capacity, and but ordinary judg-
ment, are not able to discern what things are fittest
for each kind and state of regiment. *Id.*

We are not to look that the church should change
her publick laws and ordinances, made according to
that which is judged *ordinarily* and commonly fittest
for the whole, although it chance that for some par-
ticular men the same be found inconvenient. *Id.*

Yet did she only utter her doubt to her daughters,
thinking, since the worst was past, she would attend
a further occasion, lest overmuch haste might seem
to proceed of the ordinary mislike between sisters in
law. *Sidney.*

Our courteous Antony,
Being barbered ten times o'er, goes to the feast;
And for his ordinary pays his heart
For what his eyes eat only. *Shakspeare.*

Spain had no other wars save those which were
grown into an ordinary; now they have coupled
therewith the extraordinary of the Valteline and
Palatinate. *Bacon.*

Villiers had an intimation of the king's pleasure to
be his cupbearer at large; and the summer following
he was admitted in ordinary. *Wotton.*

He at last accepted, and was soon after made
chaplain in ordinary to his majesty. *Fell.*

Here is plainly the eminency of an Episcopal
chair, and Jerusalem the seat of St. James, and the
clergy his own, of a college of which he was the
prepositus *ordinarius*; he was their ordinary. *Jeremy Taylor.*

The instances of human ignorance were not only
clear ones, but such as are not so *ordinarily* sus-
pected. *Glanville.*

It is sufficient that Moses have the ordinary credit
of an historian given him. *Tillotson.*

There is nothing more ordinary than children's re-
ceiving into their minds propositions from their pa-
rents; which, being fastened by degrees, are at last,
whether true or false, rivetted there. *Locke.*

Prayer ought to be more than *ordinarily* fervent
and vigorous before the sacrament. *South.*

Nothing is so modish as an agreeable negligence.
In a word, good-breeding shows itself most, where
to an ordinary eye it appears the least. *Addison.*

Though in arbitrary governments there may be a
body of laws observed in the ordinary forms of ju-
stice, they are not sufficient to secure any rights to
the people; because they may be dispensed with. *Id. Freeholder.*

Through the want of a sincere intention of pleas-
ing God in all our actions, we fall into such irregu-

larities of life, as by the *ordinary* means of grace we should have power to avoid.

Law.

The standing *ordinary* means of conviction failing to influence them, it is not to be expected that any extraordinary means should be able to do it.

Atterbury.

Springs and rivers do not derive the water which they *ordinarily* refund, from rain.

Woodward.

You will wonder how such an *ordinary* fellow as Wood could get his majesty's broad seal.

Swift.

They reckon all their errors for accomplishments: and all the odd words they have picked up in a coffee-house, or a gaming *ordinary*, are produced as flowers of style.

Swift.

ORDINARY, in common or canon law, denotes one who has ordinary or immediate jurisdiction in matters ecclesiastical in any place. In this sense archdeacons are ordinaries, but the appellation is most frequently applied to the bishop of the diocese, who has of course the ordinary ecclesiastical jurisdiction, and the collation to benefices within such diocese. There are some chapels, chapters, abbeys, &c., exempted from the jurisdiction of the ordinary. The archbishop is ordinary of the whole province, to visit, and receive appeals from the inferior judicatures. The Romish writers on canon law call the pope, by way of eminence, ordinary of ordinaries, since by the Lateran council he has taken the right of collating, by probation, to all benefices, in exclusion of the common collators.

ORDINARY, in naval language, denotes the establishment of persons employed by government to take charge of the ships of war, which are laid up in the several harbours adjacent to the royal dock-yards. These are principally composed of the warrant officers of the said ships, as the gunner, boatswain, carpenter, deputy purser, and cook, and three servants. There is besides a crew of laborers enrolled in the list of the ordinary, who pass from ship to ship occasionally, to pump, moor, remove, or clean them, whenever it is necessary. The term *ordinary* is also applied to the ships themselves: it is likewise used to distinguish the inferior sailors from the most expert and diligent. The latter are rated able on the navy books, and have £1. 4s. per month; whereas those who are rated *ordinary* have only 19s. per month.

ORDINARY OF NEWGATE is one who is attendant in ordinary upon the condemned malefactors in that prison, to prepare them for death.

ORDINATE, *v. a. & adj.* } Lat. *ordinatus*.

ORDINATION, *n. s.* }

To appoint: regular; methodical; appointed: ordination, established order or method; act of investing with office or authority, particularly ecclesiastical office.

There, as a wedded man in his estat,

Liveth a life blissful and *ordinat*,

Under the yoke of marriage ybound

Wel maye his herte injoye and blisse abounde.

Chaucer.

Finding how the certain right did stand,

With full consent this man did *ordinate*

The hair apparent to the crown and land.

Daniel.

Now they, in their *ordaining* assistant ministers, did not in every *ordination* give a distinct order as the church hath done since the apostles.

Jeremy Taylor.

Virtue and vice have a natural *ordination* to the happiness and misery of life respectively.

Norris.

Though ordained by Arian bishops, his *ordination* was never questioned.

Stillingfleet.

Ordinate figures are such as have all their sides and all their angles equal.

Ray on the Creation.

St. Paul looks upon Titus as advanced to the dignity of a prime ruler of the church, and entrusted with a large diocese under the immediate government of their respective elders; and those deriving authority from his *ordination*.

South.

ORDINATES, in geometry and conics, are lines drawn from any point of the circumference of an ellipsis, or other conic section, perpendicularly across the axis, to the other side. See **CONIC SECTIONS**.

ORDINATION is the act of initiating a person into the priesthood, by prayer and the laying on of hands. In episcopal churches it has always been esteemed the principal prerogative of bishops, and they still retain the function as a mark of spiritual sovereignty in their dioceses. Without ordination, no person can receive any benefice, parsonage, vicarage, &c. A person must be twenty-three years of age, or near it, before he can be ordained deacon, or have any share in the ministry; and full twenty-four before he can be ordained priest, and thus be permitted to administer the holy communion. A bishop, on the ordination of clergymen, is to examine them in the presence of the ministers, who, in the ordination of priests, but not of deacons, assist him at the imposition of hands; but this is only done as a mark of assent. In case any crime, as drunkenness, perjury, forgery, &c., be alleged against any one that is to be ordained, either priest or deacon, the bishop ought to desist from ordaining him. The person to be ordained is to bring a testimonial of his life and doctrine to the bishop, and to give an account of his faith in Latin; and both priests and deacons are obliged to subscribe to the thirty-nine articles. The ordination of bishops is more properly and more commonly called consecration. In the ancient discipline there was no such thing as a vague and absolute ordination; but every one was to have a church, whereof he was to be ordained clerk or priest. In the twelfth century they grew more remiss, and ordained without any title or benefice. The council of Trent restored the ancient discipline, and appointed that none should be ordained but those who were provided of a benefice sufficient to subsist them. The council of Rome, in 744, orders that no ordinations shall be held except on the first, fourth, seventh, and tenth months. In England, by can. 31, ordination days are the four Sundays immediately following the Ember weeks: being the second Sunday in Lent, Trinity Sunday, and the Sundays following the first Wednesday after September 14th, and December 13th. These are the stated times; but ordinations may take place at any other time, according to the discretion of the bishop, or circumstances of the case. Pope Alexander II. condemns ordination per saltum, as they call it; i. e. the leaping to a superior order without passing through the inferior. In the establishment of Scotland, where there are no bishops, the power of ordi-

nation is lodged in the presbytery, and by the Independents in the suffrage of the people.

ORD'NANCE, n. s. A contraction of ordinance, or from *Fr. ordonnance*. Great guns; cannon.

Have I not heard great *ordnance* in the field?
And heaven's artillery thunder in the skies?

Shakespeare.

When a ship seels or rouls in foul weather, the breaking loose of *ordnance* is a thing very dangerous.

Raleigh.

Men have devised to imitate these instruments of death, and send forth deadly bullets out of a cloud of smoke, wherein yet, as there is much danger, so much uncertainty; but this God, that discharges his *ordnance* from heaven, directs every shot to a head, and can kill as easily as shoot.

Bp. Hall.

There are examples of wounded persons that have roared for anguish and torment at the discharge of *ordnance*, though at a very great distance. *Bentley.*

ORDNANCE BILLS, or ORDNANCE DEBENTURES, are bills issued by the board of ordnance on the treasurer of that office, for the payment of stores, &c. These are not payable at any certain time, and do not bear any interest, so that the discount upon them is often very high; but they are seldom much above two years in arrear.

ORDNANCE, OFFICE, or BOARD OF, an office kept within the tower of London, which superintends and disposes of all the arms, instruments, and utensils of war, both by sea and land, in all the magazines, garrisons, and forts in Great Britain. In ancient times, before the invention of guns, this office was supplied by officers under the following titles: the bowyer, the cross bowyer, the galeator or purveyor of helmets, the armourer, and the keeper of the tents; and in this state it continued till Henry VIII. placed it under the management of a master, a lieutenant, surveyor, &c. &c. Some improvements have been since made; and this very important branch is now under the direction of the master-general of the ordnance, having under him a lieutenant-general, a surveyor-general, a clerk, a storekeeper, a clerk of the deliveries, and a treasurer, with a very great number of inferior officers, employed in the Tower of London, at Woolwich, and in almost all the forts, garrisons, and principal ports in his majesty's dominions. The office of ordnance is divided into two distinct branches, the civil and the military; the latter being subordinate to, and under the authority of the former.

Master-general of the Ordinance is deemed the principal officer in the civil branch of the ordnance; yet he is always chosen from amongst the first generals in his majesty's service. His trust is very great, as in him is vested the sole power of storing all the military magazines in the king's dominions with proper munitions of war, and likewise to supply the royal navy with what they may need in his department; the parliament granting money for this purpose. He is colonel in chief of the royal regiment of artillery, and he is invested with a peculiar jurisdiction over all his majesty's engineers employed in the several fortifications in his majesty's dominions: to him they are all accountable for their proceedings, and from him they receive their particular orders and instructions, according to the directions and commands given by his majesty in council.

In enquiring for the details of the modern state and arrangements of this part of the public service, we find much has been effected in the way of retrenchment and reform from the time of lord Mulgrave to that of the duke of Wellington, and particularly under the auspices of the latter: but that the recent recommendations of the finance committee are likely to result in still more important alterations.

ORDOVICES, an ancient nation of Britons, occupying that country which is now called North Wales, and containing the counties of Montgomery, Merioneth, Caernarvon, Denbigh, and Flint. These Ordovices, or (as they are called by Tacitus) Ordeuices, are supposed to have been originally of the same tribe or nation with the Huicii of Warwickshire, who were under subjection to the Cornavii; but the Huicii of North Wales, being a free independent people, were called Ordh Huici, or the free Huicii. When invaded by the Romans they showed a courage worthy of their name, and fought with great bravery in defence of their freedom and independence. Though routed by the Roman general Ostorius, in conjunction with the Silures, they maintained the war for a considerable time, until at length they were subdued with great slaughter by the renowned Agricola. It was probably owing to the nature of the country, and to the vicinity of Diva, now Chester, where a whole legion was quartered, that the Romans had so few towns or stations in the territories of the Ordovices. Medialonum, mentioned by Ptolemy, was the capital of the nation, and was probably situated at Maywood, in Montgomeryshire. It was a place of some consideration in the Roman times, but was afterwards demolished by Edwin, king of Northumberland. Besides this, the Romans had a few other towns in this country; as Segontium, now Caernarvon; Conovium, now Conway; and Varræ, now Bodvay; which are all mentioned in the eleventh journey of Antoninus. The country of the Ordovices was comprehended in the Roman province, called Britannia Secunda.

ORDUNA, a town in the province of Biscay, Spain, situated in a pleasant valley, surrounded by lofty mountains. It is the chief place of a district, called the Four Towns, and here is one of the chief custom-houses for the examination of merchandise coming by land from France. Inhabitants 4000. Fifty-seven miles W.S.W. of St. Sebastian, and fifty-seven N.N.E. of Burgos.

ORDURE, n. s. *Fr. ord, ordure; Ital. ordura; Teut. ord, schord; from Lat. sordes.*—Skinner. Dung; excrement; filth.

Gardeners with *ordure* hide those roots
That shall first spring and be most delicate.

Shakespeare.

Working upon human *ordure*, and by long preparation rendering it odoriferous, he terms it *zibetta occidentalis*.

Browne.

We added fat pollutions of our own,
To increase the steaming *ordures* of the stage.

Dryden.

Renewed by *ordure's* sympathetic force,
As oiled with magic juices for the course,
Vigorous he rises.

Pope.

ORE, *n. s.* Sax. *one*, *ona*; Belg. *oor*; Teut. *oer*. Unrefined metal; metal as it comes from the mine; metal in any state.

Round about him lay, on every side,
Great heaps of gold that never would be spent;
Of which some were rude *ore*, not purified,
Of Mulciber's devouring element. *Spenser*.
They would have brought them the gold *ore*
aboard their ships. *Raleigh's Apology*.

A hill not far,
Shone with glossy scurf, undoubted sign
That in his womb was hid metallic *ore*,
The work of sulphur. *Milton's Paradise Lost*.
The liquid *ore* he drained,
First his own tools; then what might else be wrought,
Fusile, or graven in metal. *Id.*

Who have laboured more
To search the treasures of the Roman store,
Or dig in Grecian mines for purer *ore*? *Roscommon*.

Quick-silver *ore* of this mine is the richest of all
ores I have yet seen; for ordinarily it contains in it
half quick-silver, and, in two parts of *ore*, one part
of quick-silver, and sometimes, in three parts of *ore*,
two parts of quick-silver. *Browne*.

Those who unripe veins in mines explore,
On the rich bed again the warm turf lay,
Till time digests the yet imperfect *ore*,
And know it will be gold another day. *Dryden*.
Those profounder regions they explore,
Where metals ripen in vast cakes of *ore*. *Garth*.
That head, with greater than magnetic power,
Caught it as Danae caught the golden shower;
And, though the thickening dross will scarce refine,
Augments its *ore*, and is itself a mine. *Byron*.

ORE, in natural history, the compound mineral, gleebe, earth, stone, or other substance, which is sufficiently rich in metallic particles to be worth purification, and separation of the metal from it, whether gold, silver, copper, &c. See **CHEMISTRY**, **METALLURGY**, and **MINERALOGY**, also the various metals in their order.

OREADES, in ancient mythology, nymphs of the mountains, daughters of Jupiter, or, as others say, of Phoroneus and Hecate. They attended Diana in hunting. See **NYMPH**.

OREBRO, a district of Middle Sweden, comprising the former province of Nerike, the west part of Westmanland, and a part of Warmeland. Its area is 1780 square miles; population about 100,000. The province is fertile in corn; and abounds more in mines and pasturage. The chief town is also Orebro.

OREBRO, an old neatly built town of Sweden, in the province of Nerike, on the river Svartelf, about two miles from the lake Hjelmars. Its manufactures have almost disappeared. Yet its inhabitants (about 4000) carry on an active trade with Stockholm, by the lake, the canal of Arboga, and the lake Mælar. It has wide streets, paved with round pieces of granite; and the principal church contains the monument of Engelhart.

OREL, an extensive and fertile government of European Russia, to the south of those of Tula and Kaluga, extending from 32° 50' to 39° of E. long. and from 52° to 54° of N. lat. Its area is 16,000 square miles. Its climate is temperate, and it is thought one of the best corn countries in Russia. Its pastures also are good, and rear a number of horses. The sheep produce a sufficient quantity of wool for consump-

tion, but little for export; the rearing of bees and honey and wax, form objects of considerable importance. As yet manufactures have made little progress. The trade is of more consequence, an official return having declared the mercantile capital to be £2,000,000. The exports consist of the products of agriculture, and the forests of some iron mines, and finally, of lime and alabaster quarries. The government is divided into twelve circles. Population 1,000,000.

ORELLANA (Francis), the first European who discovered the river of the Amazons. In 1539 he embarked near Quito, upon the river Coca, which farther down takes the name of Napo. From this he fell into another larger river; and, leaving himself entirely to the direction of the current, he arrived at Cape North, on the coast of Guiana, after sailing nearly 1800 leagues. Orellana perished ten years after, with three vessels which had been entrusted to him in Spain, without being able to find again the mouth of this river. In sailing down the river, he met with some armed women, against whom an Indian cacique told him to be on his guard; and he thence named it the River of the Amazons.

ORENBOURG, the most westerly government of Asiatic Russia, having on one side the government of Tobolsk, and on the other Russia in Europe. To the south, and in a great measure to the east, it borders on Independent Tartary. This is one of the most mountainous regions in the empire, comprehending the most elevated part of the great chain of the Urals. Yet it yields grain sufficient to become an object of exportation, and maintains vast flocks and herds. Even the camel is bred here for the purposes of the trade with Interior Asia. Bees are also a very profitable object of attention. A great quantity of large fish and caviar, taken in the Oural, are exported. Its mountains are equally a source of wealth, being filled with rich mines of copper and iron; it contains sal-gem and saline lakes. It is divided into twelve districts, the principal being Orenbourg Proper, and Oufa, the last of which contains the capital. On the Tartar frontier Orenbourg is exposed to the incursions of the Kirghise and Kalmouk hordes, for defence against which there have been erected a chain of frontier forts. Population 629,426.

ORENBOURG, a town in the government of the same name, of which it was the capital till 1702, when the seat of government was transferred to Oufa. It is of an oval form, in a vast plain, and regularly fortified. The streets are straight, and well built; it has nine churches, and was originally built higher up the Oural, but in 1739 was transferred 120 miles lower, and in 1742 fifty miles more. It is chiefly supported by the trade with Tartary and Bukharia. Through this channel are exported cloths of a red or scarlet color, velvets, Russia leather, linens, blue and white, copper and iron utensils, sugar and other colonial produce, glass, toys, &c. From Tartary the caravans bring India muslins and cottons, Persian silks, cotton-wool, gold dust, lapis lazuli, and a few precious stones; also skins, wool, and hair. The Kalmouks and the Kirghises bring to the market of Orenbourg from 40,000 to 60,000

sheep, and 10,000 horses. The last are transported into Russia, and the sheep chiefly employed in the production of tallow, which is sent to Petersburg. A pretty considerable branch of trade consists in the sale of golden eagles, which are highly valued by the Kirghises. Long. 52° 31' 10" E., lat. 51° 46' N.

ORESTES, in fabulous history, the son of Agamemnon and Clytemnestra. When his father was cruelly murdered by Clytemnestra and Ægisthus, young Orestes was saved from his mother's dagger by his sister Electra, called by Homer Laodicea, who privately conveyed him to the house of Strophius, king of Phocis, who had married a sister of Agamemnon. He was tenderly treated by Strophius, who educated him with his son Pylades. The two young princes soon contracted a most inviolable friendship. When Orestes came of age he visited Mycenæ, and avenged his father's death, by killing his mother Clytemnestra and her adulterer Ægisthus. After this he was acknowledged king of Mycenæ; but, being tormented by the Furies for having slain his mother, he exiled himself to Argos, where Apollo purified him, and he was acquitted by the unanimous decision of the Areopagites, whom Minerva herself instituted on this occasion, according to the poet Æschylus. Pausanias says, Orestes was purified of the murder at Trozene, where still was seen a large stone at the entrance of Diana's temple, upon which the ceremonies of purification had been performed. There was also at Megalopolis, in Arcadia, a temple dedicated to the furies, near which Orestes bit off one of his fingers with his teeth, in his insanity. But Euripides says that Orestes, after the murder of his mother, consulted the oracle of Apollo at Delphi, where he was told that nothing could deliver him from the furies, if he did not bring into Greece Diana's statue, from the Taurica Chersonesus, which, as was believed, had fallen down from heaven. Thoas, king of Chersonesus, always sacrificed to the goddess all who entered his country. Orestes and his friend were therefore both doomed to be sacrificed. Iphigenia, the sister of Orestes, was then priestess of Diana's temple, and it was her office to immolate these strangers. The intelligence that they were Grecians delayed the preparations, and Iphigenia was anxious to learn something about her native country. She interested herself in their misfortunes, and offered to spare the life of one of them, provided he would convey letters to Greece. This was a difficult trial; never was friendship more truly displayed.

*Iræ jubet Pylades carum moriture Orestem;
Hic negat; inque vicem pugnat uterque mori.*

At last Pylades yielded to the intreaties of his friend, and consented to carry the letters to Greece. These were addressed to Orestes himself, and led to a discovery of the connexion of the priestess with the man whom she was going to immolate. Iphigenia, when the cause of their journey had been explained, resolved to fly from Chersonesus with them, and to carry away the statue of Diana. Their flight was discovered, and Thoas prepared to pursue them; but Mi-

nerva interfered, and told him that all had been done by the will of the gods. Orestes came to Cappadocia from Chersonesus, and left there the statue of Diana at Comana. After this Orestes reigned at Argos; married Hermione the daughter of Menelaus, and gave his sister to his friend Pylades. Hermione had been promised to Orestes, but Menelaus had married her to Neoptolemus the son of Achilles, who had exerted himself so much in his cause during the Trojan war. Orestes, to recover her, assassinated Neoptolemus. According to Ovid she had always been faithful to her first lover. With her he retired to his kingdom of Argos. His old age was crowned with peace, and he died in his ninetieth year, leaving his throne to his son Tisamenus; who was, three years after, expelled by the Heraclide. Orestes died in Arcadia, by the bite of a serpent; and the Lacedæmonians, who had become his subjects at the death of Menelaus, were directed by an oracle to bring his bones to Sparta. They were some time after discovered at Tegea, and his statue appeared to be seven cubits, according to the traditions mentioned by Herodotus and others. The friendship of Orestes and Pylades became proverbial; and the two friends received divine honors among the Scythians.

ORESTIDA, a country of Greece, south-west of Macedonia, so named by the subjects and descendants of Orestes, who settled in it, after they were expelled from Argos by the Heraclide.

OREWEED, or } Lat. *ora*, the shore. A

OREWOOD, *n. s.* { weed either growing upon the rocks under high water mark, or broken from the bottom of the sea by rough weather, and cast up by the wind and flood.—*Carw's Cornwall.*

ORFGILD, *n. s.* The restitution of goods or money taken away by a thief by violence, if the robbery was committed in the day-time.

ORFORD, a borough and market-town of Suffolk, eighty-nine miles from London, situated between two channels, where the river Ore, after having joined the Ald, falls into the sea. It was once a large populous town, with a castle and nunnery, of which there are still some ruins. The towers of the castle and its church are a sea mark. The town was incorporated by Henry III., has a mayor, eighteen portmen, twelve chief burgesses, a recorder, a town clerk, &c. It sent members to parliament in the 26th of Edward I., and still sends two. It is an ill-built town, but was once a place of considerable trade, till, the sea throwing up a dangerous bar at the mouth of the harbour, it was choked up, and the town fell to decay. In it is a town-hall, and an assembly-house. It is eighteen miles east by north of Ipswich.

ORFORD, CAPE, a point on the north-west coast of North America, formed by the low land, projecting from a high rocky coast a considerable way into the sea, and terminating in a wedge-like cone. It was thus called by Vancouver, in honor of the earl of Orford, and is in long. 124° 31' W., lat. 42° 52' N.

ORGAGNA (Andrew), an excellent Italian painter, born at Florence in 1329. In his youth he learned sculpture; he was also a poet and an

architect. His style resembled that of the other painters of his time. Most of his works are at Pisa. The most admired of them is his picture of the Last Judgment, in which he painted his friends among the blessed, and his foes in hell. He died in 1389.

ORGAN, *n. s.* } Fr. *organe*; Ital. *Span.*
ORGANIC, *adj.* } and Port. *organo*; Lat.
ORGANICAL, } *organum*; Gr. *opyavov*.
ORGANICALLY, *adv.* } An instrument of any
ORGANISM, *n. s.* } kind, particularly a nat-
ORGANIST, } ural instrument con-
ORGANISATION, } sidered in relation to
ORGANISE, *v. a.* } some specific faculty;
ORGAN-LOFT, *n. s.* } thus we call the ear
ORGAN-PIPE. } the organ of hearing: a

wind instrument of music, of peculiar power: organ is, relating to organs; composed of various co-operating parts; instrumental: organically, by means of organical disposition of parts: organism, organic structure: organist, one who plays upon the organ: organisation, construction by mutually subservient parts; methodical structure or arrangement: to organise is to form, construct, or bring into action organically, or by the mutual co-operation of parts: organ-loft, and organ-pipe, are the loft and pipe of a musical organ.

As the soul doth *organize* the body, and give unto every member that substance, quantity, and shape, which nature seeth most expedient, so the inward grace of sacraments may teach what serveth best for their outward form. *Hooker.*

When he shall hear she died upon his words,
The ever lovely *organ* of her life
Shall come apparelled in more precious habit
Than when she lived indeed. *Shakespeare.*

The thunder;
That deep and dreadful *organpipe*, pronounced
The name of Prosper. *Id. Tempest.*

For a mean and *organ*, by which this operative virtue might be continued, God appointed the light to be united, and gave it also motion and heat. *Raleigh.*

The aptness of birds is not so much in the conformity of the *organs* of speech, as in their attention. *Bacon.*

He rounds the air, and breaks the hymnick notes
In birds, heaven's choristers, *organick* throats;
Which, if they did not die, might seem to be
A tenth rank in the heavenly hierarchy. *Donne.*

He, with serpent tongue
Organick, or impulse of vocal air,
His fraudulent temptation thus began. *Milton.*

Every man's senses differ as much from others in their figure, colour, site, and infinite other peculiarities in the *organization*, as any one man's can from itself, through divers accidental variations. *Glennville's Scopsis.*

They who want the sense of discipline, or hearing, are by consequence deprived of speech, not by any immediate *organical* indisposition, but for want of discipline. *Holder.*

A genial and cherishing heat so acts upon the fit and obsequious matter, wherein it was harboured, as to *organize* and fashion that disposed matter according to the exigencies of its own nature. *Boyle.*

An *organist* serves that office in a publick choir. *Id.*

She could not produce a monster of any thing that hath more vital and *organical* parts than a rock of marble. *Ray.*

Those nobler faculties in the mind, matter *organ-ized* could never produce. *Id. on the Creation.*

All stones, metals, and minerals, are real vegetables; that is, grow *organically* from seeds, as well as plants. *Locke.*

The identity of the same man consists in a participation of the same continued life, by constantly fleeting particles in succession vitally united to the same *organized* body. *Id.*

That being then one plant which has such an *organisation* of parts in one coherent body, partaking of one common life, it continues to be the same plant, though that life be communicated to new particles of matter, in a like continued *organisation*. *Id.*

How admirable is the natural structure or *organism* of bodies. *Graw's Cosmologia.*

Each then has *organs* to digest his food;
One to beget, and one receive, the brood. *Prior.*

The *organical* structure of human bodies, whereby they live and move, and are vitally informed by the soul, is the workmanship of a most wise, powerful, and beneficent being. *Bentley.*

While in more lengthened notes and slow,
The deep, majestic, solemn, *organs* blow. *Pope.*

Five young ladies of no small fame for their great severity of manners, would go no where with their lovers but to an *organloft* in a church, where they had a cold treat and some few opera songs. *Tatler.*

ORGAN, in music, denotes the largest and most harmonious of all wind instruments; on which account it is called *opyavov*, the organ, the instrument, by way of excellence; chiefly used for playing a thorough bass, with all its accompaniments.

That organs are the invention of remote antiquity is generally allowed; but the particular time and country in which the discovery was made are uncertain. In ancient authors there are various passages where mention is made of the organ, but it was probably an instrument very different from that which now goes by this name.

It appears indeed to have been borrowed by the Latins from the Greeks, but not to have been in general use till the eighth century. Vitruvius describes an organ in his tenth book, and St. Jerome mentions one with twelve pairs of bellows, which might be heard 1000 paces, or a mile off; and another at Jerusalem, which might be heard at the Mount of Olives.

It has been affirmed that, in France, it was not known till the time of Louis I. A. D. 815, when an Italian priest taught the use and construction of it, which he had learned at Constantinople. By some, however, it has been carried as far back as Charlemagne, and by others as far as Pepin.

See article Music, p. 280.

The Greeks called the organ *organum*, to indicate instrumental music, which, by uniting several pipes, imitated several voices; and to distinguish the organ from other musical instruments the Romans called it *organum pneumaticum*, an instrument of air. We do not find, says Mr. Danneley, any traces amongst the ancients which inform us that there was, in their time, an instrument at all assimilating with our organ, excepting the clepsydra, and the instrument invented by Pericles, unless amongst the Hebrews, when in the time of David and Solomon, one amongst others, was made use of in their religious ceremonies called the huggab, composed of several pipes of different sizes methodically ar-

ranged. But since the Jews were dragged into captivity and the destruction of their temple under Titus, nothing is known either of their instruments or of their music. The invention of the modern organ is generally attributed to Archimedes, who flourished 200 years before the Christian era; and he is said to have made the bellows act by a hydraulic machine, but we are ignorant of the substitute for the clavier (see CLEPSYDRA) and of the number of notes of which his organ was composed. This species of mechanical organ was in use till the sixth century; but since that epoch this instrument has been enlarged and brought to perfection; and in the eighth century the clavier comprised only two octaves. Matheson, in his *Perfect Organist*, says that the English had their first organ in 650. In the tenth century there were several organ builders in Italy, and in the eleventh organs were built in the churches belonging to the monasteries; from the twelfth to the fifteenth the art of constructing organs increased, particularly in Germany; the clavier comprised already three octaves, and in the year 1480 the pedal was introduced by a person named Bernard; in the sixteenth century organs were made with two claviers or rows of keys, comprising four octaves and with a greater number of stops. Since that time this instrument has become not only one of the principal ornaments in churches, but it has also contributed to the perfection of the musical art; and this art, as well as that of poetry, painting, architecture, eloquence, and literature in general, is much indebted to religion for its advancement and support.

Bellarmino says that the organ began to be used in the service of the church about 660. Ammonius thinks, however, that this happened after 820, in the time of Louis the Pious. The learned Bingham, in his *Origines Sacræ*, affirms that organs were not used till after the time of Thomas Aquinas, and he adds these words: 'Our church does not use musical instruments, as harps and psalteries, to praise God withal, that she may not seem to Judaize.' Hence it has been concluded, by the learned Gregory, that they were not used in churches in his time, about A.D. 1250. It appears, however, from the testimony of Gervas the monk of Canterbury, who flourished A.D. 1200, that organs were introduced upwards of 100 years even before that time. If Gervas's authority be held good, it will give countenance to a pretty general opinion, that in Italy, Germany, and England, they became frequent about the tenth century. See MUSIC. But it is certain that the use of the organ was very common in the latter ages of the church, and the propriety of it was undisputed. In the seventeenth century, however, during the civil wars, organs were removed from the churches in England; and so generally reprobated that, at the Restoration, there could scarce be found either organists, organ builders, or singers. Organs have never yet been used in the establishment of Scotland since it became Presbyterian; but they are used in Holland, where that form of church government also obtains.

ORGANS, REMARKABLY LARGE. The organs in Germany (says Dr. Burney) in magnitude,

and the organists in abilities, seem unrivalled in any other part of Europe, particularly in the use of pedals. In Marpurgh's *Essays*, vol. iii., there is a minute account of a variety of organs in Germany; of all which the longest pipe of the manuals is sixteen feet long, and of the pedals thirty-two. One of the largest organs in Germany is at Gorliz in Upper Lusatia. The uncommon merit of Handel as an organist is well known. The organ in the cathedral church at Ulm in Germany is ninety-three feet high and twenty-eight broad: its largest pipe is thirteen inches diameter, and it has sixteen pairs of bellows.

ORGAN, THE CHURCH, consists of two parts; the main body, called the great organ; and the positive or little organ, which forms a small case or buffet, commonly placed before the great organ. The size of an organ is generally expressed by the length of its largest pipe: thus they say, an organ of eight, sixteen, thirty-two feet, &c. The several parts of the church organ are as follow:—H I H, plate ORGAN fig. 1, is the sound-board: which is composed of two parts, the upper board or cover H H H, and the under-board H I, which is much thicker than the other; each of these consists of several planks laid with their edges to each other, and joined very close together. In the under side of the lower board there are made several channels, which run in the direction L L, M M, &c., and are continued as far as there are stops in the organ, and come almost to the edge H K. These channels are covered over very close with parchment or leather all the way, except a hole that is commonly at the fore end next H K, upon which a valve or puff is placed. These channels are called partitions. When this valve or flap is shut, it keeps out the air, and admits it when open. On the upper side of the lower board there are likewise cut several broad square channels, lying across the former, but not so deep as to reach them; these lie in the direction L N, P Q, &c. To fit these channels, there are the same number of wooden sliders or registers *f, f, f*, &c., running the whole length; and these may be drawn out or thrust in at pleasure. The number of these is the same as that of the stops in the organ. I K K K is the wind chest, which is a square box fitted close to the under side of the lower board, and made air-tight, so that no air can get out but what goes through the valves along the partitions. V, V, are the valves or puffs which open into the wind-chest; they are all enclosed in it, and may be placed in any part of it, as occasion shall require. One of these valves, with the spring that shuts it, and the wire that opens it, is represented by fig. 2. C, D, E, F, &c., are keys on which the fingers are placed when the organ is played: these keys lie over the horizontal bar of wood W, in which are stuck a usual number of wire pins *s, s*, on which keys are fixed; and the keys move up and down on the ear, as on a centre. There is another bar, against which the keys fall when put down, and which is here marked 3: on this also are several wires, which go through the keys to guide them; and on this bar a list is fastened to hinder the keys from knocking against the wood. The keys are made to communicate with the valves several ways, as

we shall now describe. First *s, s, s*, are the key-rollers, moving on the pivots *t, t*: these rollers lie horizontally, one above another, and are of such a length as to reach from the valve to the key; *a, a, a*, are arms or levers fixed to the key rollers; *w, w*, the valve wires fixed to the arms *a, a*, and to the valves *V*, and go through the holes *h, h*, in the bottom of the wind-chest: *b, b, b*, are likewise arms fixed to the key-rollers: *d, d, d*, the key-wires, fixed to the arms *b, b*, and to the keys *C, D, E*. When the end of any one of the keys *C, D, E*, is put down, it pulls down the arm *b*, by the wire *d*, which turns about the roller *s* with the arm *a*, that pulls down the wire *w*, which opens the valve that is shut by the spring as soon as the pressure is taken off the key. In this construction there must be a worm spring fastened to the key, and to the bar *W* on the further side, to keep down the end *5* of the key. Another method of opening the valves is thus: *xy, xy*, are slender levers, moveable on the centres *1, 1*; *5x, 5x*, are wires going from the further ends of the keys to the ends *x* of the levers; *yV, yV*, are other wires, reaching from the ends *y* of the levers, through the holes *h*, to the valves *V*. So that putting down the key, *C, D*, &c., raises the end *5*, which thrusts up the end *x* of the lever, by the wire *5x*: this depresses the end *y* of the lever, which pulls down the wire *yV*, and opens the valve *V*. A third way of opening the valves is this: at the end of the key *b* is a lever *8, 9*, moving in the centre *7*. This makes, with the key, a compound lever. From the end *9* a wire goes to the valve. Now the putting down the end *6* of the key raises the end *8*, which depresses the end *9*, of the lever, *8, 9*, pulls down the wire, and opens the valve. There is only one of these in the plate, and but a few of the others, to avoid confusion. *R, R*, are the rollers, to move the sliders, by help of the arms *cf, cf*, which are fixed horizontally in these rollers: *ke, ke*, are also levers fixed in the rollers; *le, le*, are the handles, which lie horizontally, and pass through the holes *ll*; they are fastened to the lever *ke*, being moveable about a joint at *e*. Any handle, *lp*, being drawn out, pulls the end *e* towards *l*, which turns about *Rk*, along with the arm *cf*; and the end *f* pulls out the slider *fg*; and, when *p* is thrust in, the arm *cf* likewise thrusts in the slider *fg*. Upon the several rows of holes which appear on the top of the upper board there are set up an equal number of rows of pipes. The pipes of an organ are of two kinds; the one has a mouth like a flute, the other with reeds. The first, called pipes of mutation, consist (1) of a foot *AA BB* (fig. 3), which is a hollow cone, which receives the wind that is to sound the pipe: (2.) To this foot is fastened the body of the pipe *BB DD*. Between the foot and the body of the pipe is a diaphragm or partition *FEF*, that has a long but narrow aperture by which the wind comes out; over this aperture is the mouth *BBC*, whose upper lip *C*, being level, cuts the wind as it comes out. The pipes are of pewter, of lead mixed with a twelfth part tin, and of wood. Those of pewter are always open at their extremities: their diameter is very small, and their sound very clear and shrill. Those of lead mix-

ed with tin are larger; the shortest are open, the longest quite stopped; those of a mean size are partly stopped, and have besides a little ear on each side the mouth, to be drawn closer or set further asunder, in order to raise or lower the sound. The wooden pipes are square, and their extremity is stopped with a valve or tampon of leather. The sound of the wooden and leaden pipes is very soft; the large ones stopped are commonly of wood, the small ones of lead. The longest pipes give the gravest sound, and the shortest the most acute: their lengths and widths are determined by a fixed proportion to their sounds; and their divisions are regulated by a rule, which is called the diapason. The longest has commonly sixteen feet; but in very large organs it has thirty-two feet. The pedal tubes are always open, though made of wood and of lead. Whatever note any open pipe sounds, when its mouth is stopped it will sound an octave lower, and a pipe of twice its capacity will likewise sound an octave lower. A reed-pipe consists of a foot *AA BB* (fig. 4), that carries the wind into the shallot or reed *CD*, which is a hollow demicylinder, fitted at its extremity *D* into a sort of mould, by a wooden tampon *G*. The shallot is covered with a plate of copper *KK'LL*, fitted at its extremity *II*, into the mould, by the same wooden tampon. Its other extremity *KK* is at liberty: so that the air entering the shallot makes it tremble or shake against the reed: and the longer that part of the tongue *II*, which is at liberty, is made, the deeper is the sound. The mould *II*, that serves to fix the shallot or reed, the tongue, tampon, &c., serves also to stop the foot of the pipe, and make the wind go out wholly at the reed. Lastly, in the mould is soldered the tube *HH*, whose inward opening is a continuation of that of the reed: the form of this tube is different in different ranks of pipes. The degree of acuteness or gravity in the sound of a reed pipe depends on the length of the tongue, and that of the pipe *CK*, taken from the extremity of the shallot to the extremity of the tube. The quantity or intension of the sound depends on the width of the reed, the tongue, and the tube; as also on the thickness of the tongue; the figure of the tube, and the quantity of wind. To diversify the sounds of the pipes, a valve is added to the port-vent, which makes the wind go out in fits or shakes. In fig. 1, *X* represents a flute-pipe of wood, *Z* a flute-pipe of metal, *Y* a trumpet-pipe of metal. The pipes, to prevent them from falling, pass through holes made in boards, placed upon the upper board. The pipes are made to communicate with the wind-chest in the following manner: there are holes bored that go through the upper and lower boards and through the slider (when it is drawn out) into the partition below; so that any pipes placed upon those holes will then communicate with the partition, which by its valve communicates with the wind-chest. But, when the slider is thrust in, its holes do not answer to those in the upper and lower boards; therefore the communication is stopped, so that no wind can get to the pipe. To every large organ there must be at least two pairs of bellows, which are marked in fig. 1, by *TU, TU*. *O, O*, are handles, moving upon the

axis *nn*, *nn*. Each of these bellows consists of two boards, the lowest of which is immovable; and in this there is a valve *r*, opening inwards, and a tube leading to it, called the conveying tube. There is also a hole in this under board, from which a tube leads to the port-vent, which is a square tube marked 4, rising upward, and inserted into the under side of the wind-chest at 2. In the tube leading to the port-vent there is a valve that opens towards the port-vent, and suffers the air to go up the port-vent, but not to return. Now the handle *O*, being pulled down, raises the upper board *T*, and the air enters through the valve *r*; and, when the handle is let go, the weight of the upper board, which carries three or four pounds to every square foot, continually descending, drives the air through the port-vent to the sound board: and, as the bellows work alternately, one pair is constantly descending, which occasions a continual blast through the port-vent. In chamber organs there is but one pair of bellows; but they are formed of three boards, in the manner of a smith's bellows, and so have a continual blast. All the internal structure of the organ is concealed from the sight by the front of the instrument, which stands upon the part between the numbers 3 and 6 (fig. 1). In every organ the number of partitions *L L*, *M M*, &c., there are in the sound-board (fig. 1) that of the valves *V V*, that of the rollers *s s*, or of the levers *x y*, or 8 9, and their wires, and that of the keys *A, B, C*, &c., must be always equal. Large organs have commonly four or five sets of keys, besides those that belong to the pedals or large pipes, the stops of which are played by the feet. These command certain pipes, which, to increase the harmony, are tuned below the diapason. The keys of an organ are usually divided into four octaves; which are the first sub-octave, second sub-octave, middle octave, and first octave. Each octave is divided into twelve stops or frets, of which seven are black and five white; the former mark the natural notes, and the latter the artificial, that is, flats and sharps. The number of keys, therefore, when there are four octaves, must be forty-eight. Some organists add one or more stops to the first and second sub-octaves. The pedals have two or three octaves, at the option of the organist: so that the number of stops is indeterminate. The keys are placed between *G G*, (fig. 1), but the figure could not contain them all. There are also as many handles *l, l*, &c., rollers *R, R*, &c., sliders *f, f*, &c., as there are stops upon the organ; and it must be observed, that between the sliders *f, f*, &c., there are as many sliders on the right hand and the same number of handles and rollers, and other rows of pipes placed between *L N*, *P Q*, which could not be expressed in the figure. The least pipes and partitions are placed toward the middle of the organ, and the greatest on the outside. The stops of an organ have various denominations, according to the sounds they are to produce; some of which are diapason, principal, fifteenth, twelfth, tierce, cornet, trumpet, French horn, vox humana, flute, bassoon, cremona, &c. The foreign organs especially, those of Germany, have many more: particularly that in the cathedral of Mentebourg in Suabia, which has seventy-

five stops, and contains no fewer than 7500 pipes. The organ at St. Paul's has only 1976 pipes. The organ at Haerlem is said to have sixty stops, many of them but little known to the English workmen, and distinguished by names that express the sound which they produce. When this magnificent instrument is played the handle *O* of the bellows is first put down, which raises the upper board *T*, and gives room for the air to enter by the valve *r*. Then the other handle *O* is put down; in the mean time the board *T*, belonging to the first handle, descending, and shutting the valve *r*, drives the air through the other valve, up the port-vent, and into the wind-chest. Then drawing out any handle, as that of the flute-stop *p l*, which draws out the slider *f g*, all the pipes in the set *L N* are ready to play, as soon as the keys *C, D, E*, &c., are put down; therefore, if the key *D* be put down, it opens the corresponding valve *m V*, through which the air enters into the pipe *X*, and makes it sound. In the same manner any other pipe in the set *L N* will sound when its key is put down; but no pipe, in any other set, will sound till the slider be drawn out by its corresponding handle. Among the modern improvements of the organ, the most remarkable are the swell, the tremblant, and the horizontal bellows; the first, invented by an English artist, consists in a number of pipes placed in a remote part of the instrument, and enclosed in a kind of box, which, being gradually opened by the pressure of the foot, increases the sound. There is a tremblant in the organ at the German chapel in the Savoy, the principles of which, together with those of the horizontal bellows, are explained in our description of the celebrated organ of St. Sulpice in Paris.

ORGAN, THE HYDRAULIC, denotes a musical machine that plays by water instead of wind. Of these there are several in Italy, in the grottoes of vineyards. Ctesebes of Alexandria, who lived in the time of Ptolemy Euergetes, is said to have invented organs that played by compressing the air with water, as is still practised. Archimedes and Vitruvius have left us descriptions of the hydraulic organ. In the cabinet of queen Christina is a beautiful and large medallion of Valentinian, on the reverse whereof is seen one of these hydraulic organs; with two men, one on the right, the other on the left, seeming to pump the water which plays it, and to listen to its sound. It has only eight pipes, placed on a round pedestal. The inscription is *PLACEAS PETRI*.

An eight feet is a term used to describe an organ the lowest pipe of which measures eight feet in length. A stopt eight feet is one of which the pipes of four feet, being stopt, produce the effect of an open eight feet; because in that case the column of air of four feet has double the distance to make before it finds an issue; it has therefore eight feet instead of four, and gives the unison of the open pipe of that size. A pipe measuring sixteen feet and stopt, therefore, will produce the unison of an open pipe of thirty-two feet.

The pipes of organs are distinguished by their sound: some are soft, brilliant, and some of a piercing or shrill nature, and extend throughout the clavier; some imitate the flute, hautboy,

clarinet, and bassoon, whilst others imitate the trumpet, trombone, cremorne, &c., and extend only through certain portions of the clavier; i. e. according to the diapason or natural compass of the instruments imitated. But in order to provide for these deficiencies of the clavier other stops of a corresponding quality of tone are joined with the short stops. The materials employed for the formation of pipes are wood, copper, pewter, and tin; copper and pewter amalgamated form the metal; lead, wood, and lead; lead and tin or pewter amalgamated; silver and copper gilt, white iron and carton. In general the harder the substance, as copper and silver, pewter or tin, the more brilliant or piercing the tone. Pipes of wood or lead, on the contrary, give soft sounds; there are also pipes of porcelain, glass, and baked earth; these are far less subject to be out of order by the change of temperature of the atmosphere than those of wood or metal.

An organ pipe of the deepest species will not suddenly intonate when not accompanied with the sound of another pipe; but, if its octave be in play at the same time, it will answer the fleetest touch upon the clavier: because the tone of the largest pipe, being in accordance, causes a motion of the air contained in the greater pipe, and the vibrations of the contained air, being coincident with those of the sound of the pipe, promote its speaking by putting the pulses of the mouth into a regular motion. The greater the pipe the less quickly it intonates of itself, and the shorter, therefore, the pipe the more suddenly it intonates: a principle imperatively requiring a suitable mixture of stops for the production of simultaneous and correct harmony.

To the temperament given to the principal, all other stops are tuned; it extends throughout the clavier and is made of wood, also of metal. The lowest pipe of this stop measures either four, eight, sixteen, or thirty-two feet in length.

An organ, however large and numerous its stops, is never displayed to advantage if entirely tuned in octaves and unisons to the principal; and unless the third, decima, tenth, or seventeenth, and the fifth, or twelfth, of each of these octaves and unisons be heard at one and the same time, much of the brilliancy and richness of the organic sound would be lost. Stops denominated thirds and fifths are therefore inserted amongst the list of organ stops. But as these thirds and fifths which, without trial, one might be induced to think insufferable to the ear when repeated in succession throughout the instrument, constitute perfect major harmonic combinations of sound, their effects, as may easily be understood, would be intolerable were they suffered to predominate over the unisons and octaves of the other stops: perfect harmonics by direct movement being strictly forbidden; and a major species of harmonic combination of sound would be set in opposition, occasionally, with the minor mode, to the dominant of which it could only satisfactorily amalgamate. These accessory stops, although extending throughout the organ, do not absolutely comprise, on account of their peculiar diapason or extent, more than three octaves; these are repeated in the lower part of the clavier. Flutes,

tierces, and fifths, comprising each an extent of one octave only, are occasionally repeated to every octave of the clavier: a system productive of the finest effects. The greater number of stops tuned in octaves and unisons, the greater must be the proportion of tierces, fifths, and compound stops. The tierce stop is considered higher than the fifth, a principle ascertained to be derived from nature: every sonorous body producing by its vibrations the sounds of the twelfth and seventeenth major. See SOUND.

Cornets and mixtures are designated compound stops.

Cornets are of three species, consisting of five ranks of pipes each, called the grand cornet, solo cornet, and echo cornet, each lever of which causes five different pipes to sound at the same time, viz. the octave, fifth, fourth, and major third, yet they produce but one sound: for instance, when the lever or the note C is held down it produces the octave, its twelfth, double octave, and its seventeenth major, but C is only supposed to be heard or appreciated, which proves that sound is not a simple element, but an aggregate of concomitant sounds. The cornet stops were formerly much used in churches with the diapasons in the interludes, and giving out of the psalms. In modern organs these compound stops, from motives of economy, in England, have been superseded by others of the reed species. Dr. Smith is mistaken in saying that the best tuning of an organ cannot wholly prevent that disagreeable battering of the ears with a constant rattling noise of beats, quite different from all musical sounds, and destructive of them, chiefly caused by the compound stops called the cornet, mixture, and sesquialter: these battering effects arising in cases only where a disproportionate force is given to the fundamental stops of the octaves and unisons.

The mixture is composed of four, six, eight, ten, and, upon the continent, often extends to twelve ranks of pipes. The pedals have also their mixture stops, and are in proportion to those belonging to the claviers: without this proportion the inequality of tone would be insupportable and totally destructive of harmony. Mixtures are divided into the great, middle, and little, of which one, two, or the whole may, by the action of a coupling stop, be brought to act simultaneously with the other stops, i. e. according to the proportionate force required by quantity, and quality of tone given to the different claviers.

The bellows expiring and inspiring the air by turns by the aid of levers, give a brisk agitation to the air by enlarging and contracting its capacity. This pneumatic machine has been much improved of late in England in the horizontal bellows; a column of air being now supplied and drawn at the same moment by the action of a crank and other appendages, instead of levers, &c., upon four feeders and pumbers.

Organs vary in size, and are of two, four, five, six, seven, fifteen, twenty, thirty-six, forty-six, fifty-six, sixty, sixty-one, sixty-five, seventy-five, and eighty stops, with from one to five claviers, and one or two claviers for the feet.

The following is the description of the organ

at St. Sulpice in Paris. It has five claviers for the hands besides those for the feet; fourteen pairs of bellows six feet in length by three and a half, of which six are for the great organ, four for the positive, and four for the pedals, and is considered the most complete in Europe:—

First clavier.

1. Grand cornet, composed of five ranks of pipes, made of pewter.
2. Montre (front) of eight feet pewter.
3. Bourdon (stopt diapason) of sixteen feet; the upper half with a small funnel or pipe at the top of each tube, and the lowest entirely stopt, made of oak.
4. Flute of eight feet in pewter, comprising three octaves.
5. Bourdon (stopt diapason) of four feet, stopt in unison, with an open diapason of eight feet.
6. Prestant, from prestare, signifying to figure, to run divisions, to ornament a given subject (open diapason) of four feet, in pewter.
7. Nazard of four feet, the fifth from the prestant, made of pewter.
8. Quarte de nazard, the octave of the prestant, of two feet in pewter.
9. Doublette of two feet in pewter, the octave of the prestant.
10. Tierce, seventeenth.
11. Larigot, the octave flute.
12. Furniture, or mixture, of five ranks in pewter.
13. Cymbale of four ranks of pipes in pewter.
14. Clarinet, of three perfect octaves, a reed stop made of pewter.
15. Cromorne, or crooked horn, a reed stop of four feet pewter, and of the bassoon species.
16. Bassoon, four complete octaves, pewter.
17. Trumpet of eight feet, four octaves, pewter.
18. Clarion of four feet, four octaves, pewter.

Second clavier.

1. Montre (front) of thirty-two feet, the upper half the clavier of pewter, the other of oak.
2. Montre of sixteen feet, an open stop made of pewter.
3. Bourdon of eight feet, stopt diapason.
4. Montre of eight feet, open diapason.
5. Flute of eight feet, open.
6. Grand cornet of five ranks of pipes, in pewter.
7. Bourdon, of four feet stopt; the treble and tenor open and made of pewter; the bass stopt, and made of oak.
8. Prestant of four feet, open.
9. Great nazard of six feet, sounding the fifth of eight feet.
10. Nazard, an open stop of three feet, the fifth of the prestant of four feet, in pewter.
11. A quarter nazard, an open stop of two feet in unison with octave of the prestant, of four feet in pewter.
12. Great tierce of three feet.
13. Little tierce.
14. Doublette the octave of the prestant.
15. Furniture of nine ranks of pipes.
16. Cymbale of five ranks. This stop is occasionally composed of nine ranks of pipes.
17. Trumpet of eight feet.

18. Vox humana. This stop is in unison with the open diapason, and is composed of short metal pipes of a wide and globular form at the top, resembling the human mouth.

19. Trumpet.

20. Trumpet of three octaves, doubled in the lower octave by a clarion.

21. Clarion in pewter.

Third clavier.

1. Grand cornet of five ranks of pipes
2. Bombarde of sixteen feet in pewter, of the reed species. This stop is sometimes made of wood.
3. Trumpet of eight feet, pewter.
4. Clarion of four feet, pewter.

Fourth clavier.

1. Open flute for solo, made of lead, descending to F below the treble staff.
2. Cornet, for solo, composed of five ranks of pipes, made of lead.
3. Hautboy, solo, made of pewter.
4. Trumpet, solo, in pewter.

Fifth Clavier.

1. Open flute, an echo stop, in lead, descending to C below the treble staff.
2. Bourdon, an echo stop, with a funnel at the top of each pipe.
3. Cornet of five ranks of pipes.
4. Trumpet.
5. Clarion.

Sixth Clavier.

1. Pedal of sixteen feet stopt, of wood.
2. Ditto.
3. Pedal of eight feet open.
4. Two pedals of eight feet open.
5. Pedal of the great nazard.
6. Pedal of four feet.
7. Pedal of the bombarde of thirty-two feet; a reed stop in wood.
8. Pedal ditto of twelve feet.
9. Trumpet pedal of twelve feet.
10. Second trumpet pedal of twelve feet.
11. Clarion pedal of six feet.
12. Two pedals of tremblants.

These stops consist of moveable machines placed in the principal channel of the wind-chest, near the port-vent to intercept the regular current of air. Turning upon their axes by the force of the wind, they give to the sound of the organ a trembling or beating effect, of which there are two sorts called the gentle and violent tremblants; the former consists of one plate, and the latter of two plates, of iron, inversely placed and fastened to a piece of wood. On certain occasions of divine service in the Roman church, these stops are exceedingly effective.

In addition to the number of stops already noticed, of which we have not their equivalents in England, are the flute creuse, cors de nuit, nassat, tibia angusta, flautone, musette, salcional, chalameau, shallmey, ranquet, regal, sourdine, viola da gamba, viol d'amour, violoncello, unda maris, vox angelica, forest flute, fistula vulgaris, bear flute, cornemuse, flageolet, bass cornet, violin, carillon or campanetta, bird stops of the nightingale and cuckoo, timbals, cymbals, fanfares, fugara, double flutes, bissera, and the

etalle, which consists of an immense number of small pieces of sonorous metal all turning upon separate axes, serving, by the action of the wind conducted from the wind-chest, to prolong the resonance of a pair of cymbals.

The etymology of many of the terms given to the above stops is unknown; their powers as combined with others more generally known to us being unnecessary to describe, we will conclude this article with a few remarks upon the proper management of the stops generally allotted to organs of English manufacture; of these, for the great organ, are open diapasons, stopt diapasons, principal, twelfth, fifteenth, tierce, mixture, or furniture, sesquialtra, trumpet, and cornet. For the choir organ are the stopt diapasons, flute, principal, twelfth, fifteenth, mixture, cremona, and vox humana; and for the swell are the open diapason, stopt diapason, principal, cornet, trumpet, and hautboy.

To produce the most perfect combination of organic sound, the flute stops form the principal attention of the experienced organists of Germany; the depth and shrillness of all other stops as of thirty-two, sixteen, four, two and one foot, being so arranged by them, that the greater powers of the larger pipes do not stifle the less powers of the smaller pipes.

A stop remarkable for its softness of tone must never be set in opposition with a powerful toned stop; several of the former may be effectively employed with the latter.

Too great a distance between the octaves, as for example, between a sixteen and a two, feet stop, must be avoided; a stop is well supported by another of an octave higher, as a thirty-two and a sixteen feet stop. A distance of an octave, or even a double octave, may be advantageously adopted in the performance of a solo, especially with a stop of peculiar qualities, as of the reed species, giving the harmonic support to the solo with the other hand upon a different clavier.
